By the evening the Austrian XVII. and VII. Corps had reached the Dukla pass and the Laborcza valley, driving before them Radko Dimitriev's broken right wing, which took refuge behind the Jasiolka and the Carpathian ridge, leaving behind many prisoners and vast quantities of war material.

In view of these successes, it was to be expected that the Russian XXI. Corps would shortly be compelled to evacuate the Lupków pass which would shake the whole Russian front along the Carpathians to the E. of it. The rolling-up of this line seemed to ensure the complete strategic success of the five days' "breakthrough" battle of Gorlice–Tarnów in which Radko Dimitriev's army had been driven back more than 20 m. on a front of 100 m., with a loss of 50,000 prisoners, 50 guns and much other material.

The Pursuit and Battles at Sanok and Rzeszów (May 6–11).—After his severe defeat, Radko Dimitriev's plan was to hold the Lupków pass with his left wing, and, supported upon this, to bring the pursuit to a stand on the line Nowotaniec-Besko-right bank of the Wislok, where there were positions favoured by the lay of the ground, and then, between the Vistula and the Wislok, on the line Wielopole–Zassow–Malec. Here he proposed to reconstitute his units, which had fallen into great disorder, and to strengthen them by bringing up reserves. Troops were sent to him from other fronts, and by the 8th he could again dispose of 18 inf. divs., 5 cav. divs. and 5 Reichswehr bdes. The orders were that the offensive was to be continued with all possible vigour. Mackensen's army was to push forward over the stretch of the Wislok between Besko and Frysztak on Mrzyglód and Tyczin, and the Archduke Joseph Ferdinand on Rzeszów, while Boroević was to roll up Brussilov's VIII. Russian Army in the direction of Sanok. Böhm's II. Austrian Army was to join up corps by corps from the left wing in proportion to the progress of the attack.

In the course of the 8th the Russian positions were once more attacked along the whole front, and in the sector of Mackensen's army were stormed along the whole E. bank of the Wislok. Both here and in the front of the centre and right of the IV. Army the fighting was heavy; the Russians were driven by the latter from Pilzno and Brzostek and pursued beyond Debica and the hill of Chelm. In front of the newly formed group under Gen. von Kirchbach, composed of Stöger-Steiner's Div., the German 47th Res. Div. and certain Landsturm formations, on the left wing of the IV. Army, the Russian IX. Corps fell back in the afternoon to the new line prescribed.

Meanwhile, Boroević had also pressed the Russians hard and by 3 A.M. forced them to abandon the Lupków pass as well as the strong Bukowica ridge, and to retire to the line Zarszyn-Bukowsko-Szczawne, where they once more took up strong positions. As a natural result of the retreat of the III. Russian Army, the whole of Brussilov's VIII. Army began to give ground, and Böhm's army, with the W. wing of Linsingen's, at once took up the pursuit.

On the 9th, however, violent resistance was once more encountered, particularly on the fronts of the German Southern Army and the Austro-Hungarian II. and III Armies, from the Ostry hill to Besko. The Russian *point d appui* at the latter place was much endangered by the withdrawal of the Russian front fighting against Mackensen to the left bank of the Stobnica; but it was urgently necessary to hold it, as also the strong front Bukowsko–Szczawne, in order to secure Brussilov's undisturbed retreat. Despite a violent counter-attack delivered by three newly arrived divisions astride the Sanok road between Besko and the left flank of the Russian line on the Stobnica, the Russians were forced to abandon Besko on the evening of the 9th.

When on the 10th Böhm's left wing, pressing forward by Baligrod and the San, captured Szczawne, and the gallant X. Corps on Boroević's left took Zarszyn, the strong position of Bukowsko became untenable; and by the evening of the 11th the Russians had fallen back behind the San. The III. Army followed them up to the area Sanok-Zagorez. Meanwhile the XI. Army had stormed the Stobnica position and advanced its front. Of the Archduke Joseph Ferdinand's army Kirchbach's corps on the evening of the 11th reached the Lower Wislok while the centre took Sedziszow. During the night of the 12th the IX. Corps secured Rzeszów.

The Russians, after some minor rear-guard actions, had also fallen back along the whole front before the II. Army, so that on the 11th the Austrian left wing had reached the Lisko area, while the right had passed the Upper San, where the Southern Army was.

At this point may be said to have ended the battle of Rzeszów-Sanok, the effects of which were quickly seen in the retirement of the enemy line N. of the Vistula. The Russians now prepared to make a fresh stand on the strong defensive line of the San below Przemysl, where they had constructed strong lines of defences, with their flanks resting on the Dniester marshes at Wielki Bloto, and the angle made by the Vistula and the San. Up to this point they had lost 130,000 prisoners, 100 guns and 300 machine-guns.

Events up to the Battle of Przemysl (May 12–23).—The Russians, foreseeing the possibility of a further retreat, had chosen as their next position the line of the San below the fortress of Przemysl, which had again been placed in a state of defence, as far as Nisko, and they had strengthened this line by the construction of bridge-heads at Radymno and Jaroslaw. Below Nisko the line enclosed the angle formed by the Vistula and the San, whence a particularly strong line of defence led to Tarnobrzeg and was continued on the far side of the Vistula to Klimontów and Opatów. The southern front was connected by an equally strong fortified line through Husaków and Krukienice with the Dniester, which served as the next natural line of defence for the Russians. At first, however, they did not make full use of this river as an obstacle, since they advanced their IX. Army against Pflanzer-Baltin to the Pruth.

The immediate object of the Austrian and German High Commands was to force the San below Przemysl, and to attack that fortress. The following objectives were assigned to the armies. The IV. Army was to force the Lower San, and the XI. to pass that river on either side of Jaroslaw. The N. wing of the III. Army was to push forward S. of the San against the W. and S. fronts of Przemysl, and secure that place by a *coup de main*, while its S. wing advanced by Dobromil on Mosciska. To the II. Army was assigned the direction Chyrów–Sambor, while the Southern Army's objectives were Drohobycz and Stryj. The VII. Army was to maintain its positions, while on the N. of the Vistula the armies of Dankl and Woyrsch were to follow up the enemy, with their inner flanks moving by Daleszyce on Slupia.

After breaking off the battle the Russians had rapidly fallen back to the San, and were as rapidly pursued. The pursuers encountered in the main only a few small rear-guards during the next few days; the II. Army, however, had violent fighting at the San crossings; and on the III. Army front, the 27th Div., in conjunction with the German Beskiden Corps, dispersed a hostile rear-guard on the heights of Magiera, S. of Przemysl.

On the 14th the German Guard Corps found itself face to face with the strong fortifications of the bridge-head at Jaroslaw. After a short but intense preliminary bombardment the Guard infantry, assisted by those of Field-Marshal Arz's Corps advancing from the

the passage of the Lomnica, and pressed on towards Halicz and Jezupol, while Gerok entered Stanislau

The task of the Southern Army, to roll up the hostile line in front of Pflanzer's army by an attack eastwards, was more than fulfilled when it had reached the line Halicz-Stanislau. The right wing of the Russian IX. Army had indeed been in retreat since June 9.

Pflanzer-Baltin's army had been forced back behind the Pruth by the Russian counter-offensive in the middle of May, and only at Kolomea did it continue to hold a position somewhat in the nature of a bridge-head on the N. bank. Its line ran from Delatyn, which it enclosed N.E. of Pasieczna to the Perehinsko area, where it touched Linsingen's right. On May 21 the Russians had stopped their advance and entrenched themselves along their whole front: they had some 11 inf. and 8 cav. divs. as against 8 Austro-Hungarian inf. and 5 cav. divs., with 5 independent brigades. On June 1 they delivered an unsuccessful attack against Pflanzer's left-wing corps under Field-Marshal-Lt. Count Schönburg; and next day they turned against the neighbouring corps, the XIII., S. of Nadworna, which also held its ground. On the 3rd, however, the Russian 2nd Rifle Div. managed to force a passage to the S. bank of the Pruth at Sadzawka, but was thrown back to the Pruth next day, after heavy fighting, by the hastily reënforced Eastern Group under Field-Marshal-Lt. von Czibulka.

In view of the change which had meantime taken place in the situation on the German Southern Army front, the Russians seemed determined to press forward in the direction of Delátyn, in order to secure a fresh success against the VII. Army and to put a stop to the Southern Army's progress. During the whole of the 5th they assailed the 5th Inf. Div. and Czibulka's group with the utmost violence, and forced the latter back to the line Mlodiatyn-Peczeniczyn. By the evening, however, the Austro-Hungarian troops, reënforced by some battalions from the neighbouring groups and by the 8th and 10th Cav. Divs., succeeded in driving them back to the line Kniazdw'or-Mlodiatyn, and in holding this line until the 6th.

At noon on the 4th Pflanzer-Baltin, hearing that the Russian XI. Army was withdrawing on its whole front, issued orders to Count Schönburg, in command of his left-wing group, and to Gen. Baron von Rhemen, commanding the XIII. Corps, to assume the offensive, which would also relieve Czibulka's hard-pressed troops. Schönburg was to advance eastwards with his main body on Bohorodczany, and with his right wing on Solotwina, while Rhemen was directed on Nadworna and Krasna. By the evening Schönburg had succeeded in getting forward to the heights S.E. of Maniawa, and to the line Kryczka-Jablonka-Majdan-Krasna. His advance came to a standstill on the 5th, but by then the flank attack of the Southern Army had begun to make itself felt. During the 6th the Russian attacks on Rhemen's and Czibulka's front entirely ceased, and in front of Schönburg's group rearward movements suggested that the Russian front was about to be withdrawn.

On the 7th Pflanzer-Baltin assumed the offensive all along the line. The Russians were thrown back again over the Pruth at Sadzawka, and the 36th Div. pursued them on to the far bank. The XIII. Corps got well beyond Nadworna, while Schönburg continued his attack in an easterly direction, and by nightfall stood on the Bystrycza Nadwarnianska at Grabowice. Marschall's corps took Zablotów, and Korda's XI. Corps and the 5th and 6th Cav. Divs. crossed the Pruth below the confluence of the Czeremosz. On the 8th Schönburg reached the Ottynia area, while Rhemen, Czibulka and Krautwald (III. Corps) reached the line Chlebiczyn-Korszów-Kamionka Wk.-Gwozdziec and the area E. of Wolczkowce. The right wing was advancing victoriously beyond the Pruth between Czernowitz and Sniatyn.

The 9th saw further successes; the centre and left wing forced the Russians back from the line of heights N.E. of Ottynia and Obertyn and S.W. of Horodenka. At this date Field-Marshal Lt. von Kaiser assumed command in place of Gen. von Marschall, who had been appointed to a command in the Southern Army.

Meantime, however, events on the Southern Army's front had taken an unfavourable turn, which had its repercussion on the operations of the VII. Army. Gerok's corps and the German 5th Cav. Div. had to be detached from the right of the Southern Army to its left, which was in a perilous position. This transfer, together with the fact that Schönburg and Rhemen were pushing eastwards, could not fail to create a gap in the area of Stanislau which would involve considerable danger to the inner wings of the Southern and VII. Armies if the Russians became aware of it in time. The direction of the VII. Army's advance, therefore, had to be changed from E. to N. Schonburg and Rhemen were to move to the Mariampol-Nizniow area, Czibulka to Potok Zloty, Krautwald to Czernelica, Kaiser to the adjoining Zaleszczycki area, while Korda was to attack in the direction of Toporoutz.

The Russians had meantime resolved on a counter-offensive against the Southern Army. Bothmer's advance in the Zurawno area, the possible loss of the Mikolajow bridge-head, and an advance by the Southern Army in the direction of Lemberg, would have a serious influence on the Russian situation, both in the battle of Przemysl and on the Lower Dniester.

On the 7th the right of the XI. Russian Army reënforced by 2 divisions delivered a series of fierce attacks against Szurmay's group, which were driven back by the 8th to the line Derzów-Bilcze-Medenice. At the same time a similar counter-blow was delivered against Bothmer in the Zurawno area; he held his ground successfully on the 8th, but on the morrow the superiority of the enemy on his front was so overwhelming that he withdrew to his old positions behind the Dniester. Szurmay's group also, attacked on both wings, had again to retire, and was withdrawn to the line Ruda-Tejsarów-Wolica-Letnia-Dobrowlany-Hruszów.

Faced with the urgent necessity of assisting his hard-pressed left wing, Gen. Linsingen left on his right wing before Stanislau and Halicz only Marschall's group and Hofmann's Corps. Gerok's corps (19th Inf. Div. and 38th Honved Inf. Div.) was entrusted with the defence of the Dniester between Ostrów and Zurawno, while Bothmer, with 1st Inf. Div., the 3rd Guards Div., the 48th Reserve Div., and the 40th Honved Inf. Div., counter-attacked from the Salatycze-Zurawno area in the direction of Ruda and Zydaczów. Meanwhile Szurmay's group, covered on its left by the 4th Cav. Div., had, without any assistance from other troops, forced back the enemy to Litynia, and assumed the offensive all along its front.

On the 11th the 1st Inf. Div. stormed Zurawno, and the 3rd Guard and 40th Honved Inf. Div. approached Zydaczów, while Marschall's group repulsed all attacks on Stanislau, and Hofmann's Corps prepared to carry Halicz.

The Russians, however, who had observed all their preparations, were ready with the necessary counter-measures. Reënforced by contingents from the VI. Corps, they made an attempt to break through Szurmay's front along the road to Stryj, but all their attacks failed. On the 4th, reënforced by two new divisions (33rd and 44th) of the XXI. Corps, they again attacked all along the front, and Szurmay's troops had once more to be withdrawn.

Meanwhile, the VII. Army's offensive northwards had met with great success. On the right wing Korda's corps threw the Russians back over the heights of Brdo Horosdyszcze on to the Bessarabian frontier, while Kaiser's group, despite fierce resistance, took the village of Zaleszczyki and reached the N. bank of the Dniester at Zezawa; the centre stormed the heights S. of Czernelica, while Rhemen and Schönburg on the left wing occupied Jezierzany and the area S. of Tysmienica.

On the 12th these two corps crossed the line Tysmienica-Tlumacz, and then moved against the fortifications of Nizniow, which were stormed after a short artillery preparation on the 15th. On this date the S. bank of the Dniester was in German-Austrian possession from Mariampol to Kosmierzyn, where units of the 15th Inf. Div. (XIII. Corps) crossed to the N. bank. After a short but violent resistance the Russians were driven back, and the advance was resumed on Potok Zloty.

Korda's corps on the 12th drove the Russians over the frontier, and pursued them by way of Chotin and Wladiczna to beyond Nowosielica. During the pursuit the 6th Cav. Div. encountered hostile resistance at Raszków, which was quickly overcome. As any further penetration over the frontier, however, involved the danger, not only of being as an isolated advance, unsuccessful, but of opening too wide a gap in the line near Zaleszczycki, the Austro-German front was withdrawn over the frontier on the 15th.

A favourable influence on the situation on the right wing had been exercised by the break-through achieved by Mackensen's Army Group, after the battle of Przemysl, at Mosciska and Lubaczów.

The Break-through at Mosciska and Lubaczów (June 12-15).—After the fall of Przemysl, the armies of Mackensen, Puhallo and Böhm pursued Brussilov's army with rapidly succeeding attacks until June 5. On the heights W. and S.W. of Mosciska, as far as Wielki Bloto on the one hand and on the Middle and Lower Lubaczówka on the other, Brussilov hoped again to hold up the Austro-German advance. After Mackensen's capture of Starzawa on the 5th the attack came to a standstill before the strong Russian positions. Here, as before Przemysl, the II. Army had recourse to sapping, which by the 12th brought it sufficiently far forward for the assault of the enemy lines.

Mackensen had now assumed command of the IV., XI. and II. Armies; the III. Army had been broken up, its X. and XVII. Corps going to the IV. Army after the fall of Przemysl, and the Beskiden Corps to the II. Army. He determined to make use of the breathing-space for a thorough preparation of the attack. Reserves had to be brought up to strengthen the armies, which in the matter of material also had to be made again fit to take the field by bringing up a sufficient store of munitions and by establishing a new base of supplies. Mackensen's Army Group was organized on June 10 as follows: The IV. Army (Archduke Joseph Ferdinand) stood on the front held by it during the Russian counter-offensive; the VIII. and XIV. Corps on the left wing to S. of Tarnagora; the X. Corps, brought up from the III. Army, extended thence to Stare Miasto, and the IX. Corps from Stare Miasto to the Wislok. S. of that river as far as the heights at the confluence of the Lubaczówka, stood the XVII. Corps, also from the III. Army. The total strength of the Army amounted to 14 inf. and 1½ cav. divs. From the Lower Lubaczówka to S. of Czerniawa by way of Zapalów, E. of Chotyniec and Starzawa, the XI. Army held the line. It was composed from N.W. to S.E. of the combined corps, the German X., XXII. and Guard Corps, the Austro-Hungarian VI. and the German XLI. Corps—in all 14 inf. divs. The positions of Böhm's II. Army, which adjoined it, extended from S. of Czerniawa in a circle W. of and S.W.

of Mosciska to the S. edge of the Wielki Bloto. This army comprised the Beskiden Corps, the Austro-Hungarian IV., XIX., XVIII. and V. Corps—14 divs. and 1 Landsturm Hussar brigade.

The Russian front was held by the III. Army from the Vistula to the upper Lubaczówka S. of Zapalów, and by the VII. Army thence to the Wielki Bloto. In all there were 41 inf. and 6 cav. divs. and 9 Reichwehr brigades of which, however, on June 14 two divisions of the XXI. Corps had been transferred to the W. flank of their XI. Army for the counter-offensive against Szurmay.

The general attack by all three armies began on the 13th. That of the IV. Army opened at 5:40 A.M. on the 12th with a powerful artillery preparation against the Russian positions at Sieniawa. In the course of the day Lt.-Gen. Behr's combined corps on the N. wing of the XI. Army succeeded in passing the Lubaczówka, and the Austrian 26th Landwehr Inf. Div. crossed the San at Ubieszyn and Lezachów, S. of Sieniawa, and finally got possession of the last-named place, which was held despite Russian counter-attacks.

At dawn on the 13th the XVII. Corps stormed the strong points of the hostile line at Sieniawa and Jukowa Gora, E. of it. These strong points were technically strengthened. Units of the IX. Corps had meanwhile passed to the E. bank of the San, including the whole of the 10th Div., which came into action in support of the XVII. Corps. On the same day Mackensen and Böhm opened the main attack. The Austro-Hungarian VI. Corps succeeded in pressing forward to Malastów, and to the N. of this the Guard advanced victoriously on Krakowiec. On the other hand, the II. Army at first made little headway until in the night of the 14th the successes of the XI. Army on the previous day began to have an effect. As early as the evening of the 13th the Russians began their retreat, which on the morning of the 14th became general. On this day the XVII. Corps of the IV. Army pushed forward on Cewków and the IX. on Tarnogrod, the northerly advance of the latter being intended to facilitate the advance of the adjoining X. Corps over the San. The objectives of the XI. Army were, to the E., the line Sakny-Krakowiec, and to the N., in conjunction with the IV. Army, the area S. of Lubaczów. The II. Army was to advance beyond Mosciska. By the evening of the 14th the Russians had fallen back behind that town to a new defensive line which they had prepared on the heights W. of Sadowa Wisznia, at Krakowiec and Oleszyce. This line, however, also fell on the 15th. On the previous day the VI. Corps had for the second time succeeded in breaking through the Russian front at Krakowiec, and on the following day the German XXII. Corps did the same in the Niemirow direction, and the German X. Corps in that of Oleszyce and Lubaczów. On the IV. Army front the IX. Corps captured the *point d'appui* of Pioskorowice, while the XVII. Corps exploited its success at Sieniawa. The Russian resistance also gave way in front of Böhm's army, which on the 15th had stormed the Russian stronghold W. of Sadowa Wisznia.

On the evening of the 15th and on the 16th, the Russians were in retreat along the whole front. They had once more been beaten decisively in the battles of Przemysl, Mosciska, and the Lubaczówka, and were now in full flight towards Lemberg. There existed now between the victorious Austro-Germans and the capital of Galicia only a single line of defence on the Grodek and Janow marshes of the Wereszyca, on which the 1914 battles of Lemberg and Rawa Ruska had been fought, and on this line the Russians once more attempted to make a stand.

Their losses since the commencement of the spring campaign in Galicia had already amounted to no less than 971 officers and 891,000 men captured, with 304 guns, 763 machine-guns, and vast quantities of other material. (E. J.)

DUNCAN, SARA JEANNETTE, Mrs. Everard Cotes (1861–), British-Canadian author, was born at Brantford, Can., in 1861, the daughter of Charles Duncan, merchant, and married Everard Cotes, Anglo-Indian journalist, late managing-director of the Eastern News Agency, in 1890. She began her literary work as a journalist in connexion with the *Washington Post* and afterwards the *Toronto Globe* and *Montreal Star*, contributing to the latter letters from Japan and the East, afterwards republished as *A Social Departure* (1890). During her long residence with her husband in India she made a considerable reputation as a novelist of Anglo-Indian life, notably in *His Honour and a Lady* (1896); *Set in Authority* (1906); *The Burnt Offering* (1909) and *The Pool in the Desert*, a volume of short stories (1903). Her lighter work includes *A Voyage of Consolation* (1898); *Those Delightful Americans* (1902) and *His Royal Happiness* (1915), dramatized and produced in London March 1919. She also wrote *The Imperialist* (1904), a Canadian novel.

DUNSANY, EDWARD JOHN MORETON DRAX PLUNKETT, 18th Baron (1878–), Irish author, was born in London July 24 1878 and educated at Eton and Sandhurst. He entered the army, holding a commission in the 1st batt. Coldstream Guards, and served in the South African War. He was transferred to the Reserve Royal Inniskilling Fusiliers and was wounded in the World War, April 25 1916. He unsuccessfully contested W. Wilts. in the Conservative interest in 1906.

Amongst his prose works may be mentioned *The Gods of Pegana* (1905); *Time and the Gods* (1906); *The Sword of Welleran* (1908); *A Dreamer's Tales* (1910); *Tales of War* (1918); *Unhappy Far-off Things* (1919); *Tales of Three Hemispheres* (1920). His plays include *The Glittering Gate* (1909); *King Argimenes* (1911); *The Gods of the Mountain* (1911); *The Golden Doom* (1912); *A Night at an Inn* (1916) and *If* (1921).

DUPUIS, JEAN (1828–1912), French traveller, was born at Saint-Just-la-Pendue, near Raonne, France, Dec. 7 1828, and was educated at Tarare (dept. Rhone). In 1858 he went to Egypt as a trader, and from thence to China. His trading journeys took him into many previously unexplored parts of southern China, and in 1871–2 his efforts opened up the Song-koi or Red river to commerce. The foundations of the French possessions in Tongking were thereby laid and Dupuis did much to assist in the conquest of the country (*see* 27.6 *seq.*). His explorations are described in the following works: *L'ouverture du fleuve Rouge au commerce* (1879); *Les origines de la question du Tong-kin* (1896); *Le Tong-kin et l'intervention française* (1898) and *Le Tong-kin de 1872 à 1886* (1910). Dupuis was in 1881 awarded the Delalande Guérineau prize by the Academy of Sciences in Paris. He died at Monaco Nov. 28 1912.

DURBAN, Natal, S. Africa (*see* 8.696).—Pop. (1911) 34,880 whites and 53,118 natives, Asiatic and coloured. In 1918 the whites numbered 41,865 (with suburbs 48,413), natives (estimated) 26,000 Asiatics; and other coloured persons, 23,750; total 91,615. Durban's importance and prosperity depends upon its port (Port Natal), but since 1910 it has become a manufacturing place of some note. It is the most compact of the larger S. African towns, the borough covering only 12 square miles.

Chief among modern buildings are the new Town Hall (opened 1910) and the Law Courts. The latter face the Victoria Embankment, a fine thoroughfare along Bay Beach, *i.e.* the Bay of Natal. At the Point, overlooking the eastern entrance to the harbour, an equestrian statue of Dick King, commemorative of his great ride to seek help for the infant settlement, was erected in 1915. From Ocean Beach a semi-circular pier, over 900 ft. long, encloses a bathing place free from sharks. Ocean Beach, with its esplanade and park and fine hotels, forms the chief attraction during the Durban winter season (May to Sept.) when the mean maximum temperature is 76° F. For horse-racing fixtures Durban ranks only second to Johannesburg among the cities of South Africa.

Vessels are constantly engaged in dredging the bar at the entrance to the harbour; the lowest depth of water at the entrance is 36 ft., the minimum depth at the quayside varies from 22 to 30 ft. The harbour is equipped with every facility for the rapid loading and unloading of ships. At Congella, at the N.E. end of the harbour, some 220 ac. of land had been reclaimed and 3,460 ft. of wharfage provided by 1920. Here timber and bulky goods are handled. Congella is also the centre for manufactures; it has cold-storage accommodation and does a large export trade. It was, however, the development of coaling facilities, made practicable by the nearness of the Natal coalfields, that placed Durban in 1913–4 above Cape Town as premier port of the Union. The coal bunkered at Durban, 1,196,000 tons in 1913, rose greatly during the war, but fell to 608,000 tons in 1918–9. In the same year, however, the export of coal rose to 704,000 tons compared with 261,000 in 1917–8. The rival to Durban for coal exports in South Africa is not Cape Town but Delagoa Bay, which exports the coal from the Transvaal mines. In 1918, in which year there was a great falling off in the number of ships visiting the port, the total tonnage of cargo landed, shipped and transhipped at Durban was 2,373,000—it had been 2,801,000 in 1916. In 1919 shipping increased, the total net tonnage entering the port being 2,959,000, of which 2,562,000 tons were British.

In 1910 a wireless station was opened at Durban; the first in South Africa. It has a normal range of 300 m. by day and 1,000 m. by night. In 1918—year ending July 31—the rateable valuation of Durban was £12,378,000, the revenue £1,095,000 and indebtedness £3,135,000. In that year the net profit on municipal trading was £110,000; in 1920 the municipal valuation was £13,546,000.

DUVENECK, FRANK (1848–1919), American painter (*see* 8.737), died in Cincinnati Jan. 3 1919. He was awarded a special gold medal at the San Francisco Exposition in 1915, and the same year he presented to the Cincinnati museum a large collection of his own works.

DYEING (*see* 8.744).—The changes which occurred in the practice of dyeing during the years 1909–21 were not numerous

or important, any real progress having been checked by the World War, while in the rush to make up for loss of time post-war developments have also been few and far between.

As far as cotton-dyeing is concerned the most striking feature was the continued demand for the fast colours produced by means of vat dyes (indanthrene dyes, thioindigo red, etc.) which were introduced prior to 1914. These colouring matters, of which a wide range is now available, are being extensively used, in spite of their high price, for dyeing casement cloths, warp or weft threads to form the pattern in "grey" or unbleached piece goods which are subsequently bleached in the piece, and for the production of the fastest class of work in calico printing. Effects are thus obtained, even in bright colours and tints, in a degree of fastness formerly unknown, and this circumstance should go far to strengthen public confidence in the permanence of high-class coloured cotton goods.

Of colouring matters produced on the fibre, aniline black [1] is by far the most important, and is used in increasing quantity. This black may be produced on the fibre by different methods, but the one almost universally employed to-day is a modification of Lightfoot's original process patented as long ago as 1863. Commercially known as a "copper black," it is obtained by impregnating the material with a liquor containing aniline salt, copper sulphate and chlorate of soda, and, after ageing at a moderate temperature, running the goods through a hot dilute solution of bichromate of soda. This latter treatment constitutes the improvement on Lightfoot's process.

The production of insoluble azo dyes on the fibre, which was originated by Holliday in 1880 and has since been improved upon, is largely employed especially for the brilliant para-nitraniline red, a colour which also lends itself to the production of cheap but very striking resist effects in calico printing. The substitution of the anilide of beta-oxynaphthoic acid (naphthol A.S.) for beta-naphthol in the "prepare" may be regarded as a distinct recent advance in this class of dyeing, for the resulting colours are not only fuller and more level but the new colouring matters are tinctorially about twice as strong as those obtained with beta-naphthol. A still further improvement has recently come about by which the number of operations required to produce the colour is reduced to padding and steaming. To this end the fabric is padded with a mixture of naphthol A.S. and a nitrosamine (the nitrosamine obtained from diazotized ortho nitro para-toluidine) and the colour developed by steaming in a rapid ager. It appears likely that this class of colour will have considerable application in the future.

Among the direct cotton colours a complete range is now available (of the benzo fast red and other types) which yield shades of remarkable fastness to light, a property which was rarely shown by earlier representatives of this class of dye. For goods such as casement cloths this property is naturally an advantage, for the colours are not only easier to apply than the vat colours but are considerably cheaper. It should, however, be borne in mind that although they possess fastness to light they are liable to bleed in washing as badly as their predecessors.

Other improvements in cotton-dyeing relate mainly to labour-saving devices in the dyeing of yarn. Dyeing in the cop, "cheese" or on the beam (for warps) is more largely practised than formerly and various appliances are employed for the purpose. The principle in all of these is, however, the same, *i.e.* instead of the yarn being moved about in or passed through the dye liquor, the material to be dyed is held *in situ* and the dye liquor is caused to percolate evenly by pumping or other suitable contrivance. It is easy to understand that only such colouring matters as can be obtained in perfect solution can be employed for this kind of dyeing. The process requires skilful management to get good results, but if such can be achieved with certainty it not only saves much labour but the yarn remains in a better condition. In hank dyeing and washing the turning of the hanks to ensure uniformity of treatment requires much hand labour. This is now largely dispensed with by the use of suitable machinery for the purpose.

As regards wool-dyeing no great changes have taken place in the ordinary run of bright and most fancy colours, which are mainly got with acid dyes. For blacks and browns and other sombre colours which were formerly dyed almost exclusively with mordant colours (and are still so dyed for the best class of work), two classes of azo dyes have come into prominence which are rendered faster by means of chromate or bichromate of soda.

Diamond black may be taken as a type of the first class. The wool is dyed with this colour in the ordinary way in an acid (acetic) bath, and at the end of the operation bichromate of soda is added to the bath and the boiling continued for some time, this additional treatment resulting in a considerable improvement in fastness and at the same time darkening the shade. Colouring matters of this type are known in the trade as "after-chrome" colours. The other class comprises the "meta-chrome" colours, and of these meta-chrome brown may be taken as typical. The dye-bath is made up with colouring matter, chromate of soda and ammonium sulphate. When the temperature of the bath approaches the boil ammonia is given off and the bath gradually becomes acid, causing both colouring matter and some of the chromium to be taken up by the fibre.

As in the case of cotton, machine-dyeing is now largely practised in dealing with wool in the loose state, in slubbing and in yarn. Here also a considerable saving in labour is effected and the valuable qualities of the fibre are much better preserved.

As far as silk-dyeing is concerned what changes have occurred are not of sufficient importance to merit special mention here. Artificial silk, especially that obtained from viscose which comes into the market in ever-increasing quantity, is dyed like cotton, but requires more care in manipulation since in the wet condition its tensile strength is considerably diminished.

Effects of the War.—During the years preceding 1914 Great Britain had been drawing roughly nine-tenths of its requirements in coal-tar dyestuffs (about 18,000 tons valued at £2,000,000 annually) from abroad—mainly from Germany. It was therefore clear at the outbreak of war that, unless the deficiency could be made up the British trade in coloured textiles would be severely handicapped as soon as the stocks in hand were exhausted. As early as Sept. 1914 a strong committee of British chemical manufacturers, colour manufacturers and colour users, styled "The Dyewares Supply Enquiry Committee," was inaugurated in Manchester under the auspices of the Society of Dyers and Colourists to discuss ways and means to meet the situation. This committee held numerous meetings at which various recommendations were made, some of which were ultimately taken up by the Board of Trade. The cardinal point which it was sought to elucidate from the start was the wants of the colour users, and to this end it was sought to make a classification of the imports before suggesting any definite course of action. The users were therefore appealed to, but although the majority readily responded several large users, including two of the large combines, refused to coöperate and the whole scheme fell through. The list, which would have been of great use and would not have taken long to compile, was completed and published at the instance of the Board of Trade five years later. In the meantime, stocks had long since become exhausted, and in spite of the enormously increased activity of the English colour makers and of the timely assistance of the Swiss colour works,[2] the supply was nothing like equal to the demand. The enormous profits realized by makers were largely devoted to extending and improving their works, but the prices of dyestuffs—both artificial and natural—nevertheless soared to unheard-of figures. The shortage of dyestuffs was brought home to the public by the miserable quality of the colours in wearing apparel offered for sale. Khaki for the army was dyed on wool mainly with a colouring matter of the meta-chrome series, whereas for cotton the old method (in which chromium and iron salts supply the colour without the use of any dyestuff) was available, but khaki shades were also dyed largely with sulphide colours. Indigo for navy clothing was not available in sufficient amount to go round, and its place was taken on wool by an azo dye known as coomassie blue. For indigo-blue shades on cotton sulphide blues were mainly employed.

The principal makers of coal-tar colours in England in 1914 included the following firms: Ivan Levinstein & Co., Blackley, Manchester; Read Holliday & Co., Huddersfield; Claus & Co., Droylsden; The Clayton Aniline Co., Manchester (owned by a Basle firm and mainly concerned with intermediates); The British Alizarine Co. of Silvertown; a works at Bromborough owned by a combine of three German colour works, and a works at Ellesmere Port owned by another German combine. The two latter were sequestrated by the Board of Trade and subsequently disposed of

[1] Through an oversight the copper sulphate (10 parts) was omitted in the recipe given in 8.751. The total volume of the liquor (200 parts) should also have been stated.

[2] Seeing that the Swiss colour makers were likely to help the British textile industry out of their dilemma, the German Government stopped supplies of raw materials to Switzerland, and these were sent from England on the understanding that an equivalent supply of dyestuffs should be delivered.

to British manufacturers. In 1915 a company was formed with Government assistance to take over and extend the works of Read Holliday & Co. of Huddersfield under the style of British Dyes, Ltd. The amount of capital was £3,000,000, half of which was taken up by the Government and the other half largely by dye users, and it was decided at the time that the principal new works of the company should be established at Huddersfield, where a large tract of land for the buildings and yards had been purchased. Although at the time no efforts were spared to accelerate building and equipment the demand for colours still largely exceeded supply. Encouraged by the huge profits which were being made other works soon came into existence in various parts of the country, and each of these supplied its quota for users and for export. It may be said that in 1921 the development of the industry in England had proceeded so far that makers were in a position to supply a fair proportion of the colouring matters which were formerly imported—at a price. Considering the difficulties with which the makers had to contend in the way of having first of all to put up plant for the manufacture of the necessary intermediate products and then for the colouring matters themselves, in face of all the engineering and building restrictions which were accentuated by war conditions, great credit is due to the organizers and workers alike for this great achievement. Many processes were of course known to the chemists in pre-war works, and these offered little difficulty in the larger output. The intermediate products required for the manufacture of the azo dyes alone (the largest and most important class of the coal-tar colours) had to be first worked out in the laboratory before being put into operation on the large scale, for they had previously all (with the exception of aniline and toluidine) been obtained from Germany. In 1897 a plant was working in Manchester for the manufacture of two of the most important of these intermediates—beta-naphthol and alpha-naphthylamine, and German colour makers at that time actually drew their supplies of the latter product from England. But it was not many years before they were offering their own products for sale in England at prices lower than they could be produced at, with the result that the British manufacture was given up and imports were made from abroad. What was necessary in the way of preliminary work in the case of intermediates was naturally also required for the new colouring matters introduced, and this of course also required not only time but the undivided attention of a large number of skilled chemists. Another difficulty which the British colour makers were up against was the shortage of acids, especially oil of vitriol and fuming sulphuric acid or "oleum." This meant the huge additional burden of having to erect new chambers and contact plant without which progress would have ceased.

After 1918, the British Government, recognizing the importance of dye manufacture as a "key" industry to the most important of the manufacturing industries—the textile industry, and in view of the fact that the colour industry and the manufacture of high explosives had something in common, decided to extend their support of dye-making as a national industry, and a new concern was launched under the style of "The British Dyestuffs Corporation, Ltd." The new firm included British Dyes and Levinstein, Ltd. (which had previously bought up Claus & Co.), and started off with a capital of £10,000,000. Lord Moulton, who during the whole period of the war had undertaken the arduous and difficult duty of supervising the explosives branch of the Ministry of Munitions, was elected the first chairman of the new company. He possessed an intimate knowledge of some branches of the colour industry, and had from the outset taken a keen interest in their war-time development. The vast new works which have been erected by the company at Huddersfield are well planned and substantially built. Once in proper working order they should go far towards meeting the whole of the requirements of the British textile industries.

After the signing of peace at Versailles it was not unnatural that the German colour makers should have desired to re-open their trade in coal-tar colours with England, and as the British consumers had been so long accustomed to the excellent products which they had supplied, German colours again began to be imported. The legality of this procedure was challenged by the British Government, who caused a consignment of pyrogallic acid to be impounded under a Proclamation dated June 25 1919. But in the test case against Mr. John Brown, trading as Brown & Fourth, Mr. Justice Sankey held that the Proclamation was illegal and invalid. Subsequently some thousands of tons of German-made dyestuffs were imported, and it soon became clear that the regenerated British industry would receive a severe check through foreign competition. To obviate this the Dyestuffs bill, which it had been intended to bring in immediately following the Sankey judgment, was prepared and passed somewhat hurriedly (but not without opposition) through both Houses of Parliament and came into force on Jan. 15 1921. The Act offers protection to the colour-manufacturing industry for a period of ten years, and is worked on the basis that no dyestuff may be imported which can be satisfactorily made in Great Britain. All imports in dyestuffs must pass through the hands of a licensing committee appointed by the Board of Trade. It was difficult to conjecture how this arrangement would work in the long run, but unless the prices of the British-made products were to be very materially reduced from their existing standard they were likely to constitute a drain on the textile industries which would not be justified. As long as the Act remains in force internal competition could operate as the only check. The colour users in England were quite prepared to pay a reasonable price for the possession of a colour industry of their own, and are large shareholders in the Dyestuffs Corporation. In this respect there is a precedent which, though well known in some circles, is not very common knowledge. About the year 1879 the manufacture of alizarine was almost entirely in the hands of the German works. They formed a combine and demanded an extortionate price for their products, whereupon the United Turkey-red Co. and other large British users of alizarine founded in 1882 the British Alizarine Co., which in spite of all foreign competition was a flourishing concern from its inception and has remained so ever since. Had it not been for the existence of these works (the only alizarine works in the world outside Germany) the English calico-printing trade would have almost gone out of existence during the war.

The difficulties which the British textile industry had to face owing to the shortage of dyestuffs was the lot of all other countries with a textile industry which were at war with Germany. In Belgium and France the industry was located almost entirely in the war zone. Nevertheless the French were not slow to resuscitate their old-established colour-making industry. Italy never had one and was supplied for war purposes either with dyed material or with dyestuffs largely from England. In Russia a works was started previous to the revolution under the management of Swiss technical chemists with a capital of £1,000,000. Japan appears to have had a fairly large stock of German dyes, but before these gave out colour works were started in that country which are reported to have been worked successfully. In India the position was very bad, and recourse was had largely to the indigenous natural dyestuffs, which were, after all, not very long since, the only dyes used there. The position in the United States and in Canada was very much the same as in England. The United States had, however, the advantage of having come into the war much later, although in 1917 their stocks of foreign-made dyes must have been at a very low ebb. Several American colour works of considerable capacity had existed prior to 1914 and had been protected by a 30% ad valorem import duty, plus a fixed duty of 7 cents per pound, on foreign dyestuffs. Without having to appeal to the State for further assistance, new and important works were started under the supervision of Swiss or German scientifically and technically trained chemists, private capital being abundantly supplied for the purpose.

It has been computed that, taking the world's production of artificial dyestuffs as 100, the distribution in 1913 was as follows: Germany 74·1, Switzerland 7, Great Britain 6·5, France 5·4,

United States 3·3, Austria 1·6, Russia 1·1. In view of the great changes which have taken place these figures are now of course no longer valid. What the figures were in 1921 was not even approximately known, but it is certain that the world's producing capacity, as distinct from actual production, was far in excess of any likely demand.

A good deal has been said and written about the correlation of dyestuff manufacture and the manufacture of high explosives, poison gases and other products required for chemical warfare. As far as the manufacture of high explosives is concerned, two main products, namely picric acid and trinitro toluole (T.N.T.), come into consideration. It is not very generally known that the former was made in England in large quantities as a dyestuff long before the French introduced it as an explosive. As a dyestuff it has long since been discarded, having been replaced by other coal-tar yellows of greater fastness which are not subject to any official restrictions. Both of these substances are nitro compounds of the aromatic series, and, like those manufactured as intermediates for dye-making, require, besides the coal tar common to both, large quantities of sulphuric acid, oleum and nitric acid (all products of the so-called "heavy chemical" industry) as raw materials. The nitrating operations are similar in both cases and similar plant is used, but there is always a limit to the size of the nitrating vessels which it is neither safe nor economical to exceed. Once the process is standardized on a unit of plant any increased production is obtained by increasing the number of units. Naturally any plant producing such nitro compounds in a colour works could in an emergency be turned to account to produce such a substance as T.N.T., but the amounts required for any serious military or naval operations would be vastly in excess of what could be turned out with the nitration plants of even large colour works. Nitrating is only one of a large number of important operations required in colour manufacture, and some dyestuffs are manufactured entirely without the help of this operation. The idea which seems to have become prevalent that the plant in a colour works is capable of turning out anything from a finished dyestuff to mustard gas or any new product that may come along is untenable. What is really wanted in this respect is a body of alert, scientifically and technically trained chemists. The best guarantee for the requirements of "chemical warfare" in the future is the possession of a successful colour industry, for the chemist best suited by training and habit of mind to cope with an emergency problem is the colour chemist.

United States.—The dyeing industry of the United States during 1910–21 grew commensurately with the textile industries. An important advance was made in the production of fast colours on cotton goods. This was in keeping with the rapidly extended use of cotton in high-grade wearing apparel and the increase of steam laundries, displacing household washing. Modern laundry methods of rapidly cleansing and whitening fabrics necessitated the use of strong chemicals, destructive of the colours formerly employed in dyeing cotton. The demand for laundry-fast colours was met by the introduction of the so-called "vat" dyes of which indigo was long the only representative. The extended use of the dye known as sulphur black to take the place of aniline black for cotton hosiery and piece-goods was also worthy of note. The silk industry in America also grew largely, consuming more raw silk in manufactures than any other country. This led to the great extension of silk-dyeing, chiefly in the industrial centres of South Manchester, Conn., Paterson, N.J., and Lancaster, Pa.

The World War at first threw the dyeing industry in the United States into confusion, owing to the uncertainty of trade relations with Germany, the more so when the Allied blockade put a complete embargo on Germany's exports. It was then seen how dependent America had been on Germany for dyestuffs, and it was estimated that manufacturing industries with products valued at about $4,000,000,000 might soon be thrown completely out of gear by a lack of dyestuffs. In the confusion which resulted all manner of expedients were adopted in the production of colours with a consequent reduction in the fastness and quality of dyeing. Dyestuffs became so scarce that exorbitant prices stimulated the erection of many dyestuff factories in various parts of the United States. Large amounts of capital were freely invested in the new industry, and many chemists became engaged in dyestuff research and manufacturing.

Previous to the war the United States had a small dyestuff industry distributed among about five plants. The manufacturing operations, however, were limited chiefly to the assembling of the coal-tar intermediates imported from Germany for the production of the finished dyes, so that the new industry had to be built from the ground up. To the great credit of the American chemist and chemical manufacturer it may be said that in a very short time the more important dyes were successfully made in the United States in such quantity that practically no dye-consuming industry was forced to shut down by reason of a lack of dyes. Indigo and sulphur black were soon produced on a large scale, as well as the required acid dyes for wool and silk, most of the basic dyes, and a complete line of the direct cotton dyes. In 1920 there were 213 firms manufacturing dyestuffs and related coal-tar chemicals. These employed about 2,600 chemists and nearly 20,000 workmen and the total value of the finished products amounted to over $112,000,000. There were 236 different intermediates manufactured, and 360 different dyes. The total production of dyes amounted to over 88,000,000 lb. as against a pre-war importation of about 70,000,000 pounds. The total value of the finished dyes was given as $95,600,000, so that the average price per pound was about $1.07. Over 18,000,000 lb. of synthetic indigo was made, about twice the pre-war importation, indicating great extension in the use of indigo. Associated with the making of dyestuffs there also grew up the many related branches of the coal-tar chemical industry, such as colour lakes for paints, lithographic and printing inks; coal-tar pharmaceuticals; flavouring and perfume materials; photographic chemicals and synthetic tannins and resins. The great growth of the industry created a constant demand for increasing quantities of coal-tar distillates, which form the raw materials of the dyestuff industry, and this led to a rapid increase in the number of by-products coke ovens. In 1920 the production of coke in by-product ovens amounted to about 60% of the total.

The great production of dyes in the United States during the period 1017–21 led to the building up of a considerable export trade, particularly to South America and the Orient. The total dyestuffs exported from the United States in 1920 amounted in value to nearly $30,000,000, of which $22,450,000 was for coal-tar dyes. This export trade, however, showed a rapid falling off from the beginning of 1921, due both to the general business depression throughout the world and to the fact that the German dyestuff manufacturers were again active in foreign trade.

At the close of the war the American dyestuff manufacturers quickly realized that unless they had suitable Government protection they could not meet aggressive competition from European dyestuff factories. In 1916 they petitioned for, and obtained the passage of, a bill placing a tariff of 30% ad valorem and a specific duty of 5 cents per pound on most dyes. When hostilities ended certain Government regulations were also applied to the importation of dyestuffs and related products from Germany so that such importations were licensed to bona fide consumers and were limited to dyes that could not be satisfactorily obtained from the American manufacturers. In the meantime Congress was petitioned for an embargo on importation of dyes from foreign sources except under adequate licence regulations which would restrict the imports to dyes not manufactured in the United States. This was in line with similar action by Great Britain, France, Italy and Japan, all these countries deeming it highly expedient to foster and build up a self-contained dyestuff and coal-tar chemical industry as a measure of national defence.

In the matter of natural dyestuffs America has always occupied a leading position. Many of the principal natural dyes are of American origin. Logwood, fustic, cochineal and the red-woods are all American products, discovered in, and still obtained from, Mexico, Central America and South America, as well as the West Indies. During the war a product very closely resembling fustic and known as osage orange was also developed in the United States and in 1921 was being produced in considerable quantities. As the dyer usually employs the colouring matters of the dyewoods in the form of suitable extracts, there has long been developed in the United States a considerable industry in the manufacture of these extracts, generally produced in connexion with the manufacture of tannin extracts. This industry is in no way associated with the coal-tar dyestuff business. The great scarcity of dyes during the early part of the war resulted in an abnormal expansion of the dyewood extract industry, which rapidly declined as the manufacture of synthetic or coal-tar dyes increased. In former years natural indigo was extensively used in dyeing, and in early colonial days large quantities of this dye were cultivated in the south. As the growing of cotton increased, that of indigo was neglected, so that most of the indigo used in the United States was imported, chiefly from the Far East. A certain amount, however, had long been obtained from Central American provinces and the West Indies. The advent of synthetic indigo soon displaced the natural product, so that little of this vegetable dye was used in America, although the United States in 1921 manufactured all it needed of this most important dye. After the war, owing to the shifting of the centres of trade, the United States became an important market for the sale and manufacture of furs. This resulted in the building up of an extensive industry in the dyeing and finishing of furs which will without doubt become firmly established as an important adjunct to the general dyeing industry of America. (J. M. M.)

DYSENTERY (*see* 8.785*).—This term is now employed to designate a clinical syndrome characterized by the passage of blood and mucus consequent upon the pathogenic activities—primarily upon the large bowel, leading to ulceration—of certain animal or vegetable forms of life. The advances in our knowledge of dysentery made during 1910–20 were considerable, and were in great measure due to the combined interdependent efforts of protozoölogists, bacteriologists and entomologists in their unremitting investigations and laboratory researches, to their fruitful collaboration with the physician, also to the extensive experience gleaned through the World War. Dysentery as a disease is widespread throughout the world and workers in all continents and many countries have shared in the progress of knowledge of it. This was, moreover, essential, as certain causal organisms amongst the helminths can only complete their life-cycle in the particular regions where their primary host, a lower animal, exists in nature.

Again, climatic factors play a rôle in the incidence of certain types of dysentery; and the organisms, their rôle and specific lines of treatment and prevention, can be best studied where the disease prevails. Thus American workers in Manila firmly established by experiments on condemned prisoners that there is but one, *Entamoeba histolytica*, of the five amoebae found in man which is pathogenic to him, and finally cleared up the confusion by determining its life-cycle and differentiating it from the *E. coli*, an amoeba living also in the large bowel of man.

From Hong-Kong we learned the specific action of emetine, an alkaloid extracted from ipecacuanha, on amoebae; and its application with such beneficial results to man was first made in India. Though amoebic dysentery was until recently considered a disease of the tropics, and rare in temperate countries, relative researches on inhabitants of several temperate countries show a small percentage to harbour the *E. histolytica*, some without complaint of dysenteric symptoms. The conditions of climate, sanitation, food and living may favourize individual resistance as well as susceptibility to acute symptoms. Recently a few workers in England have concluded that there are two or more strains of the *E. histolytica*, distinguishable by the size of the cyst each forms. French physicians in Indo-China have observed that in one region the *E. histolytica* gives rise to more severe dysentery and is less amenable to treatment than in another, thus raising the question of a difference in virulence amongst strains.

In Rumania in 1916 a new and distinct species of *Bacillus dysenteriae—Bacillus dys. Schmitz*—was first found.

In England and France the presence of bacteriophage has been determined. If a few drops of the filtrate from a culture of the dysentery bacillus Shiga be placed in a new growth of this bacillus, the micro-organisms are dissolved. The action is considered due to the development of an ultra-microscopic micro-organism which destroys the bacillus and appears to be specific.

As dysentery may be due to diverse organisms, the causal one or its family or generic name is employed to specify the origin, thus—*amoebic, bacillary, spirochaetic, ciliar* and *helminthic* dysentery. When there are evacuations of blood and mucus associated with inflammation and ulceration, not due to an organism which acts primarily and specifically on the lower bowel, but which may primarily attack another part of the body (*e.g.* tubercle, syphilis), or to carcinoma, or due to an impacted foreign body or mechanical irritation, the condition is termed, to distinguish it, pseudo-dysentery. When an ulcer is low down it can be seen and its character determined by the sigmoidoscope.

It is important to determine the causal organism in a sporadic dysentery case or in an epidemic, not only because of the specific treatment necessary but to assure adequate prevention of its extension; and laboratory collaboration for this is essential.

It has been amply exemplified that dysentery cannot be diagnosed on the presence of blood and mucus in the stools with accompanying abdominal pain and tenesmus. One or more of these symptoms may be absent, for they depend on the extent or site of the ulceration. In the contact or healthy carrier of the *E. histolytica* there may be no signs past or present, the *E. histolytica* to all appearances living as a harmless commensural within its human host, and the first sign of the presence of the disease may be a liver abscess, a very rare condition outside tropical regions. It is only by investigating these contact carriers in the laboratory that the disease can be detected from cysts in the faeces.

Dysentery has always been the most dire disease accompanying war. During the World War, despite our greater knowledge of its causes and of prophylactic measures to counteract it, its invaliding rôle was considerable in all armies, especially those fighting in tropical countries where the conditions favour it, and in parts of eastern Europe where sanitary control was not scrupulously exercised. The number of admissions to military hospitals which follow testify to its ravages amongst British troops, and many others there were who did not seek hospital treatment. The comparatively small death-roll was no doubt due to the application of the advances in our knowledge that dysentery may be due to diverse organisms, each having a specific line of treatment to be directed against it. Most deaths were due to *Bacillus dys. Shiga*.

In France there were 11 cases in 1914; 1915, 26 cases; 1916, 5,754; 1917, 6,031; 1918, 12,211 cases—figures which are relatively small considering the number of troops there. In East Africa 1917, 9,369 cases, 317 deaths; 1918, 1,646 with 38 deaths. In Mesopotamia 1916 (6 months), 1,939 cases with 126 deaths; 1917, 4,860 with 151 deaths; 1918, 5,455 with 109 deaths. In Egypt 1916, 5,577 cases with 81 deaths. In Italy 1918, Forward Area, 897 cases with 17 deaths; Lines of Communication (Toranto), 146 cases. In Salonika 1916, 5,987 cases with 132 deaths; 1917, 5,842 with 124 deaths; 1918, 9,318 with 158 deaths. On the Gallipoli Peninsula figures were not obtainable, but it is estimated that nearly every soldier who landed on the peninsula suffered from dysentery or diarrhoea and few escaped the former disease. Severe climate, difficulties of obtaining adequate food and sterilized water, fly pests, fatigue, hastily improvised resting places and sanitary arrangements, prolonged periods in trenches—all were important factors conducive to susceptibility in man and to the spread of infection.

Bacillary and amoebic dysenteries greatly predominated. There were exceptional and sporadic cases of spirochaetic and, amongst coloured troops especially, of ciliar and helminthic dysentery. In all countries bacillary greatly predominated. In France other than bacillary infections were rare and the amoebic type was found more frequently amongst those associated with troops from tropical countries or who took over camps or trenches used by them. In tropical and sub-tropical regions the percentage of amoebic to

* *These figures indicate the volume and page number of the previous article.*

other dysentery cases was approximately 12. More particularly in Gallipoli combined infections were not uncommon and there were cases suffering from dysentery and enterica at the same time.

During 1920, of 6,193 returned troops claiming State aid for disability from war dysenteries, 446 were still harbouring the *E. histolytica* and over 80% of these were intermittently or constantly passing blood or mucus; two acquired a liver abscess when in England as a complication; eight were still infected with the *B. dys. Shiga* and four with *B. dys. Flexner-Hiss;* one case had mixed amoebic and bacillary (Shiga) infection, and three mixed amoebic and spirochaetic, and six spirochaetic dysentery.

By reason of the variety of the causal organisms, the clinical symptoms and pathological characters to which each gives rise and the specific treatment directed against it, each type of dysentery had best be considered separately, and the commoner types, amoebic and bacillary, discussed in greater detail.

Amoebic Dysentery (also called Amoebiasis, Loeschiasis or Tropical Dysentery, the latter because of its early endemicity and greater incidence there).—The causal organism, *E. histolytica* (Loesch 1871), a species of the genus *Entamoeba*, affects man alone in nature, though the dog and cat and recently the guinea-pig have been infected experimentally. The *E. histolytica* in its life-cycle in man passes through three stages—a large *vegetative* stage when living within the tissues, giving rise to ulceration and passage of blood and mucus; a *pre-cystic* or *minuta* stage found in convalescents and in carriers when the amoebae are much smaller, live on the mucous membrane within the bowel, but which may pass through the membrane and assume the larger vegetative form, with ulceration and its symptoms following; and a *cystic* stage. The amoebae increase in numbers by division of the parent into two, but it is only the pre-cystic or minuta stage in which many of the amoebae contract into a smaller rounded or ovoid form, develop a firm outer wall and are transformed into cysts with the characteristic one to four nuclei and containing chromatoid rods which possibly act as food stores. Since it is only by swallowing these cysts that man is infected, the continuance of the entamoeba in nature is thus provided for. These cysts do not resist drying, but retain their vitality for two weeks if kept moist in the faeces or in water. They can therefore be transmitted by direct contamination with faeces through handling soiled linen, by flies carrying them on to food, by soil or by drinking contaminated water; and prophylaxis must be directed accordingly.

Clinically the disease is characterized, as are all protozoal infections, by its chronicity with tendency to recrudescence of symptoms. The onset is insidious, the sufferer first noticing a feeling of debility and lassitude with an increase of stools, soft in character, for several days. These may clear up and be the only signs noticed or may light up again and assume true dysenteric characters months later. Most often the initial stage is followed on by an acute exacerbation of symptoms, dependent in their degree upon the extent of the ulceration in the large bowel, the most markedly affected sites being the caecum and flexures. Stools become still more frequent, up to 40 or 50 in 24 hours, and the ulceration gives rise to abdominal pain and, if at the rectum, to severe tenesmus. The patient takes to his bed exhausted. In uncomplicated cases there is but slight rise of temperature or other symptoms of toxaemia as the entamoeba produces no toxin. The entamoeba gains entrance to the body by the swallowing of its cysts, which pass through the stomach unchanged. In the small intestines they germinate and young amoebulae are set free in the lumen of the intestine. They increase in size, multiply by a process of division, and by means of their lytic or dissolving power penetrate through the mucous membrane lining the large bowel, rarely the appendix save at its base, into the submucous layer, where they continue to proliferate, destroy the tissue, including the blood-vessels, thus leading to the haemorrhage that accompanies the mucus produced by the irritation of the membrane, and impede the circulation of blood and lymph at the site. A typical flask-shaped ulcer is formed, with roughened undermined edges at the orifice. When ulcers are situated approximately they are frequently joined by submucous tunnels, and, the ulcers being mechanically produced, there is little accompanying inflammatory reaction. Occasionally super-added infection with other bowel organisms supervenes and gangrene may follow, or the amoebae may penetrate through the outer muscular walls of the large bowel, giving rise to perforation and accompanying peritonitis, or, by penetrating a blood-vessel, they may be carried off in the blood stream and give rise to an abscess in the liver, to which the blood first takes them, or, as most exceptionally happens, an abscess in the brain or elsewhere. Healing is brought about by the development of fibrous tissue at the sites of the ulcers, and this contracts and leads to a thickening of the walls and constriction of the lumen which, if extensive, produces subsequent chronic constipation; or, what is rare, to stenosis and blockage. Diagnosis is quickly made by examination of the stools. In the acute condition they may consist entirely of blood and mucus or contain also a little faecal matter. The mucus is stained a brownish colour by degenerated blood cells and the blood is usually in the form of clots, not evenly mixed through it. Microscopically the *E. histolytica* is readily found and is distinguished by its rapid movement, ill-defined nucleus and greenish-tinted ectoplasm and ingested red cells. White blood cells apart from a relative increase of eosinophils are not seen in great numbers. Charcot-leyden crystals, as yet only seen in dysentery of the amoebic type, may be found.

The acute symptoms readily subside under appropriate treatment. The patient should be put to bed. The specific treatment is ipecacuanha or an alkaloid extracted from it, emetine. Combined hypodermic injections of emetine hydrochloride with oral administration of ipecacuanha (Brazilian), to attack the amoebae from within and without, have given striking results in allaying symptoms. More recently emetine alone or in combination as bismuth-emetine-iodine in a salol capsuled pill has been widely employed and good results are claimed, especially in the treatment of chronic cases. The toxic action of emetine on the heart must be watched. Added to the specific treatment in acute cases there is the general and symptomatic, which should include a free flushing of the bowel by a dose of castor oil with tinct. opii. added; later followed by magnesium (or sodium) sulphate in hourly or two-hourly half or drachm doses for 12 or 24 hours. Morphia may be necessary to relieve the abdominal pain and straining. The diet must be light and easily assimilated. Milk and raw foods should be withheld.

The symptoms subside in one to three weeks and no further trouble may supervene. However, the patient not infrequently is left with symptoms, generally slight, from cicatrization of the bowel; or, from persistence of the entamoeba, becomes a *convalescent* carrier as distinguished from a *contact* carrier, one who has never developed acute symptoms. The treatment of these carriers is one of considerable importance not only for the individual, who may re-develop acute symptoms or a liver abscess, but for the community, since these carriers pass in their stools the cysts of the entamoeba which can infect others. Treatment apart from symptomatic is directed to eliminate the amoeba in chronic cases and consists in giving orally ipecacuanha or emetine alone or combined with other drugs as a pill, capsule or paste in courses over a number of days. Emetine hydrochloride subcutaneously, or neosalvarsan intravenously, have been employed to supplement oral treatment. At the same time the large bowel is washed out by enemata per rectum, the use of appendicostomy wounds not having given sufficiently encouraging results, with solutions of quinine, tannin or, as recommended by the French, of neosalvarsan. Indiscretions in diet should at all times be avoided and it appears advisable for the carrier to reside in a temperate region. Amoebic hepatitis and a small abscess of the liver are cured by injections of emetine hydrochloride or neosalvarsan, but a large abscess needs surgical intervention.

Bacillary Dysentery.—While sharing with the amoebic the clinical dysenteric syndrome above described, it differs therefrom in the shortness of the inoculation period, generally 24 to 72 hours, by its sudden acute onset with elevation of temperature, which may persist several days or more, and other symptoms of toxaemia; extreme contagiousness; seasonal incidence (midsummer and autumn); epidemic character and predilection for temperate regions; higher death-rate and in the complications that may follow infection with *Bacillus dys. Shiga*, namely:—arthritis, conjunctivitis, muscular paralysis and myocarditis. Clinically it may assume forms varying in symptomology from mild to severe, and occasionally be hypertoxic, typhoidal or ulcero-gangrenous in character. Outbreaks of dysentery in asylums, prisons, concentration camps and ships are generally bacillary in type. In tropical regions the amoebic type also occurs, but in temperate regions this latter form is practically limited to sporadic cases.

The bacillary dysentery group comprises species of bacilli genetically related: 1. The *B. dys. Shiga* (Chantmesse and Widal 1888, Shiga 1898, Kruse 1900), a well-defined homogeneous species, known as the true dysentery bacillus since it alone contains endotoxins which are pathogenic to man and experimental animals. 2. *B. dys. Schmitz* (Schmitz 1916, Andrewes 1918, Broughton-Alcock 1918), another homologous species and one which contains endotoxins acting severely on rabbits but less pathogenic to man. 3. *B. dys. Flexner-Hiss*, a very mildly toxic group of bacilli characterized by their power to ferment mannite, produce indol from peptone and containing many species as recently distinguished by the agglutination and absorption reactions. 4. A further group which embraces bacilli characterized by specific agglutination and absorption properties and power to ferment certain sugars, *e.g. Bacillus of Strong, Castellani, Gay, d'Herelle* and others, each capable of producing a mild clinically dysenteric syndrome in man.

Clinical symptoms vary, as does the degree of the intestinal lesions and the toxicity of the causal bacillus. Infections with *B. dys. Shiga* are characteristically the most severe. The ulcerative lesions are not confined to the large bowel but extend one to two feet into the small intestine. Recent researches have proved that the bacilli pass through the stomach, multiply in the small intestine and produce at least two toxins which are absorbed into the blood, one acting on the nervous system and the other excreted into the large bowel, causing inflammation with coagulation of lymph, thrombosis of vessels and necrosis of the submucous layer and superimposed mucous membrane. An exudative fibrinous diphtheritic-like membrane forms on the bowel wall and separates off, leaving superficial ulcers with raised red oedematous edges. These may

deepen by continued microbic action and even penetrate through into the peritoneum, leading to peritonitis, or gangrene may set in in the damaged necrosed tissue, and in either case death follows unless surgical intervention is early. Repair proceeds along the same lines as in amoebic cases, but, the ulcers being generally more superficial, the permanent damage is not so great.

The stools have a characteristic microscopic appearance, as numerous pus epithelial cells and large macrophage cells are present in the mucus. Macroscopically the stool most often consists of mucus, like cloudy-grey jelly streaked or stained by bright red blood, or the mucus may be bile-stained in a diarrhoea-like stool or, in very severe cases, there are shreds of necrosed mucosa.

The causal bacillus is readily isolated by culture within the first days, but afterwards it becomes difficult as the microbic life in the necrotic tissue becomes a flora of proliferating organisms. The bacillus of Shiga, which has been the only species isolated from the blood stream, has been found therein in only four or five cases. The bacilli dysenteriae, as judged by post-mortem findings, pass to the mesenteric glands along the lymphatics, but are arrested there. After the cessation of the symptoms the percentage of cases retaining the causal organism in the bowel is very small, as testified in the figures given above. If the patient becomes a carrier of *B. dys. Shiga* the stools will continue to be in part muco-purulent, even up to three or more years. The property of agglutinating the causal organism and other strains of the same race is present in the blood after the first week and may last for only eight or ten days in mild cases, but when the infection is prolonged this property of agglutination persists for a longer period. *B. dys. Shiga* infected cases generally agglutinate also the *B. dys. Flexner-Hiss* in a lesser degree, but the converse does not hold. *B. dys. Flexner-Hiss* cases agglutinate several species of the group, rarely only the strain isolated from them. *B. dys. Schmitz* cases do not appear to develop agglutinins even for their own organism.

The general and symptomatic treatment given above for amoebic dysentery is similar, but the specific treatment widely variant, and this is directed towards neutralizing the toxins which further the clinical symptoms. It is the anti-Shiga serum, prepared by inoculating the bacilli with their contained endotoxins into the horse, which is the most efficacious; and as it is the infection with *B. dys. Shiga* which is most severe, its utility is considerable. It has been employed also in cases due to *B. dys. Flexner-Hiss* with apparently satisfactory results. A polyvalent horse anti-serum made by inoculating strains of both these groups has also been extensively given in cases of either infection and, with this, amelioration of symptoms has followed. The injection of anti-serum should be as early in the illness as possible and in large doses dependent upon the severity of the cases, *e.g.* 60 c.c., 40 c.c., 20 c.c., on successive days in a severe case; and with this treatment free saline purgation is combined until the stools become faecal. Thereby rapid amelioration follows, complications are rare, and the bacillus quickly eliminated from the body. In the early complications of bacillary dysentery anti-serum therapy again gives good results.

The general prophylactic measures to be taken are comparable to those against infections with *E. histolytica*, but it should be remembered that bacilli are lower vegetable organisms and can proliferate in suitable environment outside the body. Dependent on several factors, bacillary is more contagious than amoebic dysentery. Encouraged by successful results following inoculations of typhoid and paratyphoid vaccines, some series of inoculations with a vaccine of *B. dys. Shiga* were made in epidemic areas during the war, as this was the bacillary organism so prevalent and so toxic in epidemics during war conditions. Its contained toxins give rise to acute local reactions unless modified prior to inoculation by special methods, as by laying the heat-killed bacilli with normal serum (serum-treated) or with specific horse anti-serum (sensitized), or by inoculating both specific anti-serum and bacillary emulsions on approximating days, or by giving an absorbed specific anti-serum and bacillary emulsion simultaneously, or by emulsifying the bacilli in oil. The series of inoculations made by various workers gave encouraging results. Vaccine-therapy employed to rid the convalescent carrier of *B. dys. Shiga* has not been successful. In striking contrast with *B. dys. Shiga* the killed and untreated emulsions of the *B. dys. Flexner-Hiss* group give rise to no reaction, even in high doses.

Spirochaetic Dysentery, due to *Spirochaeta eurygyrata* (Le Dantec 1900, Werner 1910, Fantham 1916).—Investigation of this type of dysentery is in continued progress, and evidence is increasing that this spirochaeta is capable of living upon the mucous membrane of the large bowel and maintaining a chronic form of dysentery. It is seen in considerable numbers in the mucus and occasionally also within the lining cells of the glands. Occasionally there is also blood present with the mucus which is being continually passed with faeces. An acute condition with passage of blood and mucus only has been observed. This spirochaeta is resistant to intravenous injections of neosalvarsan or tartar emetic alone; and treatment by an arsenic-containing compound at the same time as a local washing of the bowel with irrigations containing eucalyptus has given the most encouraging results.

Helminthic Dysentery.—The chief helminths which give rise to dysentery are the bilharzia worms, *Schistosoma mansoni*, in Africa, South America, West Indies, and *Schistosoma japonicum* in the Far East. Bilharzia dysentery is characterized by the passage of mucus and clots of blood due to the presence of the ova which the adult female worm lays in the capillaries of the wall of the rectum. This form of dysentery is extremely common in Egypt. The discovery of the intermediate snail host and the specific action of sodium or potassium tartrate in killing these worms in man is an advance of considerable value.

Other trematodes which *may* cause dysenteric symptoms are *Fasciolopsis buski*, *Heterophyes heterophyes* and *Paragonimus westermanni*. Normally the last is a lung fluke, but it occasionally occurs in cysts of the intestinal wall, when it gives rise to the passage of blood and mucus in the stools.

In heavy infections with hook-worm (*Ancylostoma duodenale*, present in England in the mines of Cornwall, and *Necator americanus*) blood and mucus are sometimes passed in large quantities, and these cases may be mistaken for true dysentery. Thymol given orally rapidly kills off these worms.

Ciliar Dysentery, due to *Balantidium coli* and known to occur in Japan and the Philippine Is., is rare elsewhere and needs but mention. A specific remedy has not yet been found. (W. B. A.)

EAKINS, THOMAS (1844–1916), American painter (*see* 8.791), died at Philadelphia June 25 1916.

EAST, SIR ALFRED (1849–1913), English painter (*see* 8.827), was knighted in 1910, and died in London Sept. 28 1913.

EAST AFRICA: MILITARY OPERATIONS, 1914–8.—The outbreak of war found all the combatants in East Africa unprepared for offensive operations. But the advantage inclined to the Germans, for they had forces on the spot sufficient for defence, which was not the case in respect to the British protectorates bordering German East Africa. The Belgian Congo was also without adequate means of defence.

Hostilities were entirely unexpected. So little was the Government of British East Africa anticipating war with its German neighbours that the bulk of the Protectorate Force, a battalion and a-half of the King's African Rifles—negro troops officered by Europeans, together with the Uganda battalion of the same force, was, in Aug. 1914, engaged against recalcitrant tribesmen in Jubaland, on the borders of Italian Somaliland, 500 m. away. In short, all the British protectorate lay open to invasion. But Lt.-Col. von Lettow-Vorbeck, commander of the forces in German East Africa—the one German soldier who earned a high reputation in the colonial campaign—knew that his opponents would be reinforced from oversea, and contemplated nothing more than an offensive-defensive. His total force, when the war began, was just under 5,000, including 260 Europeans.

The British had the advantage of the command of the sea, and the ports of German East Africa lay open to attack. So keenly did the governor of the protectorate, Dr. Heinrich Schnee, realize their helplessness that one of his first orders was to forbid any action to be taken which would lay the ports open to bombardment. As in the case of the governors of British Dominions and Colonies the governor of German East Africa was also commander-in-chief of the forces, and Dr. Schnee asserted his authority in that respect despite the protests by von Lettow. Indeed, Dr. Schnee and many of the Government officials at Dar-es-Salaam, the capital and chief port, had "little stomach for a fight," and when on Aug. 8 two old British cruisers, the "Astraea" and "Pegasus," steamed across from Zanzibar to Dar-es-Salaam, by the governor's orders and without the knowledge of von Lettow, negotiations for surrender of the port took place. The ships had no force to garrison the town, but the Germans signed an agreement "which forbade us to undertake any hostile act in Dar-es-Salaam, while the enemy was not so bound" (von Lettow). The same day Dr. Schnee left Dar-es-Salaam for Morogoro, a pleasant hill station with European amenities, 140 m. inland by train. The high-power wireless station at Dar-es-Salaam which communicated with Berlin was destroyed.

Despite the attitude of the governor, von Lettow determined to carry on the fight to the utmost possible limit. He had taken up his command in East Africa in Jan. 1914 convinced that "the universal war," as he calls it, might be imminent, and that if it broke out it was his duty to combat as many of the enemy as he could and for as long as he could.

The country was highly favourable to protracted defence by a resolute and ruthless commander, such as von Lettow proved.

Character of the Country. A very large proportion of the country is covered by "bush," that is an undergrowth sometimes more or less open, but usually dense, from which rise trees to a height of some 30 feet. This bush covers hills and valleys and even dry desert, and in the coast region develops into luxuriant jungle. Much of it is infested by the tsetse fly. Some areas are covered with dense forests, others with elephant grass growing 6 to 10 or more feet high. The valleys of almost all the rivers are swampy and fever stricken; during the rains vast areas become inundated; in the dry season, away from the rivers, water is often lacking; wild animals constitute a real danger, especially to the wounded. The climate is tropical and very unhealthy save on a few high plateaus, and in certain hill districts malaria is endemic. These conditions existed throughout German East Africa, a country nearly double the size of Germany. The "bush" was the greatest asset of the defence. As Gen. Smuts wrote (in 1918), "in the African bush, with its limited visibility, it is practically impossible to enclose an enemy determined to escape." The method is simple—when a force is so hard pushed that destruction is inevitable if resistance continues the order is given to "line for bush," whereupon the force splits up into parties of threes and fours and vanishes into the bush. Pursuit is hopeless, and the scattered enemy, if well trained, reassembles at an appointed rendezvous. Moreover, so dense is the bush over many thousands of square miles that considerable forces may be on the march within a mile of one another, without being aware of each other's existence. These factors explain why, given sufficient armament and food, von Lettow was still in the field when the Armistice was signed in Europe, in spite of his isolation and the superior forces that after 1916 were brought against him.

Von Lettow had drawn up his plan of campaign before hostilities began, and as the best means of defence had determined to take the offensive against the enemy's most sensitive spot.[1] This he rightly conceived to be the line of the Uganda railway (which runs from Mombasa to Victoria Nyanza). The line is parallel to and about 50 m. distant from the (then) Anglo-German frontier. It passes through the Highlands, where the British European population is concentrated with Nairobi as chief town. On the "German" side of the frontier are the Usambara hills and the Pare mountains, presenting a wall-like face to British East Africa, with few passes. But between the northern end of the Pare mountains and the towering slopes by Kilimanjaro, which rise farther north, was a distinct "gap" forming the usual passage-way between the German and British protectorates. A railway from Tanga, the port of Usambara, ran to Moshi, on the slopes of Kilimanjaro, and at the western end of the "gap." At its eastern end, in British East Africa, is Taveta. This place was seized by the Germans on Aug. 15 and was used by them as a jumping-off ground for raids on the Uganda railway, raids which included the design of occupying Nairobi.

At the outset, or shortly afterwards, a design was also entertained by the Germans of capturing Mombasa and holding it long enough to wreck the harbours and destroy the great railway bridge from the island to the mainland. This was rendered possible by the return to Dar-es-Salaam in Sept. of the cruiser "Königsberg" (it had sailed from that port shortly before the declaration of war). It was then arranged that a force should march along the coast from Tanga on Mombasa, while the "Königsberg" attacked it from the sea. On Sept. 20 the "Königsberg" appeared off Zanzibar and destroyed the "Pegasus," which was in the roadstead undergoing repairs. Mombasa, was to be attacked on Sept. 29. But the "Königsberg" did not keep its engagement, ships of the Cape Squadron under Vice-Adml. King Hall intervening. Harried by the British, but not overtaken, the commander of the "Königsberg," Capt. Looff, in Oct. ran his ship aground in the shallow waters of the Rufiji river, south of Dar-es-Salaam. The land force which was to coöperate with the "Königsberg" was already at Vanga, just within the British border, and it began its march of 50 m. along the coast on Sept. 20. It attacked Gazi, 25 m. from Mombasa, on Sept. 23, was repulsed and forced to retire to the frontier on Oct. 8.

Apart from raids along the coast and on the Uganda railway the Germans made a series of incursions into the frontier districts of Uganda, the Belgian Congo, Rhodesia and Nyasaland. For

[1] Von Lettow records that at first many officers were loth to obey his orders, because, apart from the governor's attitude, they believed that "under the Congo Act" they were obliged to be neutral. In fact the German Government made neutrality proposals on Aug. 23 1914. These were rejected by the Allies (*see* AFRICA: § *History*).

these minor operations the Germans had the advantage of a central position, interior lines and better means of communication. The railway from Dar-es-Salaam to Kigoma on Lake Tanganyika had been completed about six months before the war began, and during Aug. the small steamer "Hedwig von Wissmann," manned and armed by German sailors from Dar-es-Salaam, sank the only hostile boat on the lake, a small Belgian vessel. Thus the Germans had command of the 400 m. of waterway on Tanganyika. On the two other lakes, Nyasa and Victoria, the British, however, early obtained command.

The operations in all theatres other than on the British East Africa frontier were regarded by both sides as subsidiary. At first the British had to consider purely defensive measures. At the outset the East Africa Protectorate Force was under the command of Lt.-Col. L. E. S. Ward. Volunteers were called for, and two regiments, one mounted, were at once formed by the white settlers in British East Africa. The King's African Rifles were recalled from Jubaland and were in action by September. An Arab detachment was raised on the coast by Lt. (subsequently Maj.) A. J. B. Wavell (an adventurous soldier who had made the pilgrimage to Mecca), and it rendered good service until its gallant commander was killed in action Jan. 6 1916. But outside help was needed, and the Government of India consented to send a force, officially known as "Indian Expeditionary Force B." The first regiment, the 29th Punjabis, arrived at Mombasa at the end of Aug., and with them Brig.-Gen. J. M. Stewart, who took over the command.

The Tanga Episode.

Plans for an offensive were now formed. It was decided that the bulk of the force from India should land at Tanga and occupy the Usambara Highlands, the most healthy and most developed region of German East Africa, and in which lived the majority of the German settlers. The landing finished, it was intended to advance along the railway from Tanga to Moshi. At the time Tanga was attacked Gen. Stewart was to demonstrate against Taveta, and to sweep round by Longido (N. of Kilimanjaro) to Moshi. Brig.-Gen. A. E. Aitken was selected to command the Tanga expedition. India was then being heavily drained of troops for service in France, and for East Africa troops that were not all of first-class quality had to be employed. The strength of the force was about 7,000, including one British unit, the 2nd Batt. Loyal North Lancashire Regiment. The force sailed from Bombay towards the end of Oct. and the transports arrived off Tanga harbour early on Nov. 2. The attack had been expected, news of the expedition having reached the Germans through captured Indian mails, and at the end of Oct. von Lettow had arranged with the district commissioner, Auracher, that Tanga should be defended, whatever were the instructions of Dr. Schnee. On receiving a summons from the commander of H.M.S. "Fox" for unconditional surrender Herr Auracher went on board, stated that Tanga was an open and undefended place and said that he must obtain special instructions. The British, therefore, refrained from bombarding the town, and meanwhile von Lettow was hurrying down reënforcements by rail. On the evening of Nov. 2 Gen. Aitken landed one and a-half battalions at Ras Kasone, two m. east of the port. It advanced through dense jungle to the outskirts of the town, became heavily engaged and had to fall back. The British were reënforced and the fight was renewed on Nov. 3. It was indecisive, but in the evening the officer in command, Capt. Baumstark, believing that Tanga could not be held against another attack, had collected his force four m. W. of Tanga, leaving patrols only in the town. That evening von Lettow arrived, passed through deserted Tanga, and reconnoitred the British camp at Ras Kasone. Von Lettow's plans for the morrow were, while defending Tanga itself, which he reoccupied with two companies of Europeans, to place most of his troops in the bush along the Ras Kasone-Tanga road and attack the enemy in flank. The fight was renewed on the fourth. The British and Indian troops advanced through coconut and rubber plantations and entered Tanga town. By this time fighting was severe and general, and soon after 3 P.M. von Lettow delivered his counter-attack on the British left, which, he states, he was able to outflank by means of his two reserve companies. Supported by machine-gun fire, this outflanking force was able to push its attack home, and soon the British were in full retreat to Ras Kasone. The fight continued in the dense bush till after nightfall, the Indian and British troops eventually getting back to their camp. The next day, Nov. 5, they were reëmbarked, and taken to Mombasa. The attack on Tanga had been a complete failure. The casualties in Aitken's force were, according to an India Office statement, 795, including 141 British officers and men. Sixteen machine-guns were lost. Von Lettow gives the German force engaged as "little more than 1,000." Fifteen Germans and 54 askaris were killed. The number of wounded was not stated. After this action Aitken was removed from his command, but in Dec. 1920, after a fresh investigation by the War Office, he was declared "not guilty of culpable negligence . . . and should not be held responsible for the failure."

The simultaneous attack on Longido, N. of Kilimanjaro, also failed. The Germans—about 800 strong—were strongly posted, and covered the only permanent water supply available. Stewart's attacking force numbered about 1,500. After a night march of 15 m. across a waterless region, the action began on the morning of Nov. 4 and continued till 7:30 P.M. The whole movement—typical of many operations in this theatre of war—was tersely summed up by an officer who wrote, "We marched all night, attacked at dawn, fought all day, and then having failed to turn the Germans out, came back here as we had no water."

Period of Preparation.

Following the failure at Tanga no new general offensive was undertaken by the British until the early months of 1916. The intervening period was one of preparation on both sides, with, on the part of the Germans, frequent and sometimes successful attempts to raid the Uganda railway, and on that of the British, defensive and retaliating raids of the same kind. Of the engagements of this period that at Jassin was the most notable. Following the failure of the German march on Mombasa, the British force on the coast advanced S., crossed the German frontier and occupied (Jan. 2 1915) the buildings of Jassin plantation, which was garrisoned by some 300 Indian troops. Von Lettow thinking that a land attack on Tanga was intended got together a force of 1,500–1,600 men, and attacked Jassin on Jan. 17. After 48 hours' fighting, the Indian troops, having expended all their ammunition and being without water, surrendered. Attempts by the King's African Rifles (in camp 10 m. distant) to relieve them failed. But the German losses, especially in European officers, were serious, and the expenditure of ammunition made a heavy inroad on von Lettow's small stock.

The period of preparation was spent on the British side largely in raising new troops and in the organization of transport. In April 1915 Col. M. I. Tighe, Indian army, with the local rank of Major-General, was appointed to command the troops in East Africa and to prepare for the new offensive. His force was increased by two newly raised white regiments, the 2nd Rhodesian and "Driscoll's Scouts" (25th Batt. R. Fusiliers). While parrying the raids on the Uganda railway—which were numerous and daring, but taken as a whole, ineffective—Gen. Tighe organized occasional offensives, such as the successful attack (June 1915) on Bukoba, the German base on Victoria Nyanza for operations against western Uganda. This raid was made by Gen. J. M. Stewart, and it affords an illustration of the great distances to be covered in the East African operations. Nairobi, headquarters, was 327 m. by rail from Mombasa, the base, and 237 m. from Kisumu, railhead on Victoria Nyanza. Thence Stewart's force had to go by steamer 240 m. before reaching Bukoba. To aid his operations Gen. Tighe began the building of a railway and pipe line across the 70 m. of desert between Voi, on the Uganda railway, and his advanced posts near Taveta.

The other theatres of operation in East Africa were much worse off for means of communication. To reach the German frontier bordering Nyasaland, Rhodesia and the Belgian Congo was a journey of from 2,000 to 3,000 m., including hundreds of miles to be covered on foot or by animal and mechanical transport. This involved the employment of vast numbers of carriers

in regions where local supplies of food were often non-existent. Thus in northern Rhodesia a road 400 m. long had to be cut through trackless bush, in which the areas of cultivation were infinitesimal. The Germans were better off in that, besides their two railways,[1] they had constructed several main roads before the war, and during the war other roads and some light railways were laid down. And the German troops had not such long distances as had their opponents to cover on foot. Nor were they troubled by lack of food (at least not before 1917). The natives had been compelled to establish large food dépôts at all military stations, while Usambara, in or near which the bulk of von Lettow's force was quartered for 22 months, was a land of plenty. But the necessity that they were under of guarding the coast and to a lesser extent the N.W. and S.W. frontiers, while keeping their main forces in the principal theatre about Moshi, imposed upon them a great deal of movement in a more or less N. and S. direction for which—apart from the command of Lake Tanganyika—few facilities existed. For instance, movement of supplies or stores by carrier from the Central railway to the Usambara railway took 12 days, and from the Central railway to Lindi in the S. not less than three weeks.

The German Forces.

Throughout 1915 von Lettow's chief concern was the increase and training of his forces. At the outbreak of war he had, as has been stated, just under 5,000 men (a figure which included the police as well as the troops proper). This number had been increased by Feb. 1916, when the German force was at its maximum strength, probably over 20,000. Exact figures cannot be given as the number of carriers and batmen who acted as combatants is unknown, but the rule was to arm 15% of them. Von Lettow himself says that the total numbers enrolled during the war were "about" 3,000 Europeans and 11,000 askaris (natives); the figures of casualties and captives show that the number of whites on the German side was nearer 4,000, and an official German return gave 2,217 Europeans as under arms in Aug. 1915.[2] The Europeans included most of the German settlers in Usambara and other districts, almost all of whom were ex-soldiers and many ex-officers; a few Boer settlers; German residents at Zanzibar who had been allowed by the British to cross to the mainland; some 500 sailors from ships in harbour, including over 400 men of the Imperial navy, and a few visitors to Dar-es-Salaam. These last had come to attend fêtes to mark the formal opening of the Dar-es-Salaam-Tanganyika railway, and among them was a retired Prussian officer, Maj.-Gen. Wahle, who rendered von Lettow good service. The German forces were organized in companies normally consisting of 200 askaris and 16 Europeans; a few of the companies were composed almost entirely of whites, two companies were mounted. The askaris were drawn from the most warlike tribes of the country, and were very well treated. Von Lettow himself was ever careful of their needs and shared their hardships on campaign. He won and retained throughout their respect and devotion. Besides his regular force von Lettow had in the earlier stages the help of various levies; and the anti-Moslem policy of Dr. Schnee having been reversed he also obtained the support of a number of Arabs (support which proved of little value). His movements were not, for a considerable time, hampered by disaffection among the natives; some tribes near the border of British East Africa were deported because of doubt as to their sympathies, and the converts of the British missionary societies were in general regarded as enemies and were very badly treated, many being executed. Fear of a native rising was felt among the Germans when the war broke out, but the fear proved groundless. "It was not" (writes von Lettow) "till the enemy had penetrated the country that the natives became a real danger to us; and then it was indeed very great. The native has a fine sense of the transfer of real power from one hand to the other." Even then, with the natives hostile, the askaris (who had with them their women and children and carriers) were faithful to their leader, and more resolute than many of the Germans.

That they obviously had the advantage inspired the German native troops with confidence, and the hard training they had between Nov. 1914 and March 1916 made them, as the event proved, very formidable opponents in their own country of white and Indian troops. And months before the onslaught of Gen. Smuts they had also been rearmed with modern weapons.

Blockade Runners.

On Feb. 28 1915 a blockade of the whole coast of German East Africa was proclaimed, and the British Government stated that "ample steps had been taken to make the blockade thoroughly effective." The task of the reïnforced Cape squadron under Vice-Adml. King Hall in watching 600 m. of coast line provided with many excellent natural harbours was difficult, and in fact several vessels got through. In Dec. 1914, before the blockade was proclaimed, Dar-es-Salaam was visited and the German ships which had taken refuge there sunk. In April 1915, when the Germans were in greatest need of more ammunition, the blockade was broken in a remarkable manner. The "Rubens," an English ship of 3,000 tons seized at Hamburg, had been loaded with arms and ammunition, had eluded the blockade of the North Sea, and on April 4 (its arrival was expected) was sighted by H.M.S. "Hyacinth" four m. off Mansa Bay, N. of Tanga. The "Rubens" got into the bay, severely damaged and on fire. The crew fled ashore; the ship was boarded by bluejackets, who found her timbered up and battened down; the party was recalled and more rounds having been fired into the vessel "the admiral . . . steamed away under the impression that she would burn herself out" (Brig.-Gen. J. H. V. Crowe). Subsequently the Germans salved at leisure nearly the whole of her cargo, though a great part of the cartridges had been damaged by sea water. But there were enough Mauser '98 rifles to rearm the force, which previously, for the most part, used the M 71 rifle. (A year later, at another critical period of the war, the Germans were again rearmed, by another blockade runner.)

The operations against the "Königsberg" also resulted in a valuable addition to von Lettow's armament. The cruiser had remained shut up in the shallow waters of the Rufiji, but in July 1915 the light-draught monitors "Severn" and "Mersey," sent specially from England, succeeded in setting it on fire. The cruiser was then blown up by Capt. Looff, who with his officers and crew joined von Lettow. The "Königsberg's" armament, which included 10 4·1-in. guns, was all salved, and these 4·1-in. guns formed von Lettow's heaviest ordnance.[3] The Germans also recaptured with its guns the 300-ton steamer "Adjutant" (originally taken by the British at Dar-es-Salaam), which had run aground off the Rufiji in Feb. 1915. The "Adjutant" was transferred by rail to Lake Tanganyika.

Plans for British and Belgian Offensive.

Plans for the conquest of German East Africa took shape in the summer of 1915, but their execution had to be delayed until Britain could put a sufficient force in the field. This force was not forthcoming until the close of 1915, when Gen. Botha, Prime Minister of South Africa, having conquered German South-West Africa, agreed to provide a force for service in East Africa. At the time Gen. Tighe had under him 10 regular infantry regiments supplied by India, including the 40th Pathans and the 129th Baluchis brought from France, a squadron of the 17th Lancers (Indians), Imperial Service troops, the 27th and 28th (Indian) Mountain Batteries, and the Calcutta Volunteer battery. Of white troops there were, besides the two regiments

[1] The Usambara line (Tanga-Moshi) and the Central railway (Dar-es-Salaam-Tabora-Tanganyika).

[2] Dr. Ludwig Deppe, a surgeon with von Lettow's force, who appears to have kept careful records, states that there were 3,629 casualties among the whites up to the end of Nov. 1917. He puts the highest total of the German force in the field at any one time at 3,300 whites and 15,000 askaris. These included the non-combatant services.

[3] In like manner the 4-in. guns of the disabled "Pegasus" were removed and added to Gen. Tighe's artillery. It is noteworthy that the captain of the "Königsberg" had the breech-blocks of his guns thrown overboard, but they were salved by the officer commanding the land detachment at the Rufiji delta.

raised by the settlers in East Africa, the 2nd Rhodesian Regiment, the 25th Batt. Royal Fusiliers and the 2nd North Lancashires (the only regular British infantry unit in East Africa). There were also the battalions of the King's African Rifles, but at that time the value of negro troops was not sufficiently appreciated. Though they were best adapted for warfare in equatorial Africa—and ultimately bore the brunt of the fighting—and though von Lettow had shown the way, the raising of new native regiments was neglected at first by the British.

The plan adopted by the British in conjunction with the Belgians was for a concerted attack on three sides. The object was not only to defeat the enemy, but effectively to occupy the country, so as to render impossible the splitting up of the German forces "into guerrilla bands doubling back in all directions" (Gen. Smuts). This aim was achieved with one remarkable exception, the Wintgens-Naumann raid (*see* p.883, note). But when von Lettow was driven eventually into Portuguese territory the whole remaining German force became a guerrilla band, with an unlimited field for doubling and redoubling. The scheme evolved in 1915 was to strike the main blow with the force in British East Africa, whilst the Belgians were to operate in the north-west and a second British force in the south-west of the German protectorate. This second force was gathered on the Nyasa-Rhodesia borders, and Brig.-Gen. Edward Northey assumed command of it in Jan. 1916. When, in March 1916, the Portuguese entered the war, they undertook to guard the southern frontier of German East Africa. Thus the Germans had enemies on every side, and had no opportunity (which the Germans in Cameroon took) of escaping capture by retirement into neutral territory.

When Gen. Botha's Government undertook to send forces to East Africa it had to rely upon volunteers to redeem its promise.

South African Reinforcements.

But a force already organized and originally destined for service in Europe—the 2nd South African Infantry Brigade (under Brig.-Gen. P. S. Beves) was diverted to East Africa. A mounted brigade under Brig.-Gen. J. L. Van Deventer, and a brigade consisting of five batteries of S.A. Field Artillery, with all necessary administrative and other units, were also formed so that the South African contingent was complete and self contained. Later this contingent was increased by another infantry brigade, a second mounted brigade and the Cape Boys Battalion[1] (under Col. Morris). All these troops except the 2nd mounted brigade had reached East Africa by Feb. 1916, before the offensive began.

When South Africa furnished this contingent—the largest body of white troops which had taken the field in tropical Africa—the Home Government offered the command to a South African, Gen. Smuts. Smuts was Minister of Defence in the Union Cabinet; the political situation in South Africa was uncertain and he declined the offer. Gen. Sir Horace Smith-Dorrien was then selected for the post, but while at the Cape on his way out, in consequence of ill health, he resigned his appointment. Again appealed to, Gen. Smuts accepted the command and reached Mombasa on Feb. 19. He adopted, with some modifications, the plan of campaign which Gen. Tighe had originated.

Gen. Tighe had had a very difficult task, and the *moral* of his force, predominantly Indian, had suffered through being so long on the defensive. It altered completely with the opening of the offensive. Before the arrival of Gen. Smuts the railway across the waterless waste between Voi and Taveta had been taken to Serengati, within five m. of the German post on El Oldorobo (otherwise Salaita hill), which blocked the main approach to the Taveta gap. Skirmishing had been going on around Salaita since March 1915. The hill was without water, which was taken to the garrison from Taveta in donkey carts. "Strangely enough," wrote von Lettow, "it did not occur to the enemy to interfere with it [the transport] and thus render the mountain untenable." The first action in which the South Africans took part was an attack on Feb. 12 1916, on Salaita. Brig.-Gen. Malleson with the 1st East African and 2nd South African Infantry Brigades, supported by artillery, assaulted the strongly entrenched German positions, approached through thorn bush. Little progress was made and the Germans, reinforced from Taveta, counter-attacked and compelled Gen. Malleson to retreat. The British casualties were 172, of which number 139 were among the South Africans. They suffered through ignorance of the new conditions. "The South African Infantry," wrote Gen. Smuts, "had learned some invaluable lessons in bush warfare, and also had opportunity to estimate the fighting quality of the enemy."

Gen. Tighe intended to force the enemy from the Taveta gap by a double movement. One force, under Gen. J. M. Stewart, was to sweep round Kilimanjaro from the north; another, under Gen. Malleson was to attack Taveta. The forces were to join hands at Kahe, a place on the Tanga railway S. of Moshi. Gen. Stewart, who had the 1st East African Division (infantry) and Van Deventer's mounted brigade, was at Longido, some 50 m. from Kaijado, the terminus of the Magadi branch of the Uganda railway and Stewart's base for supplies. The chief alteration in Gen. Tighe's plans made by Gen. Smuts was to bring back Van Deventer's mounted brigade to the Taveta side and to use it for a turning movement which would render a frontal attack on Salaita hill unnecessary. The infantry which were to follow up Van Deventer's movement consisted of the 2nd East African Division, of which Gen. Tighe was placed in command.

Four days after reaching Mombasa Gen. Smuts telegraphed to Lord Kitchener that he was prepared to carry out the occupation of the Kilimanjaro area at once; two days later

Kilimanjaro Operations.

(Feb. 25) Kitchener's sanction for the operation was received. There was good reason for haste as the rainy season was approaching, and during the rains operations might be (and in fact proved to be) impossible. Von Lettow was well aware of the enemy's movements, and as early as Aug. 1915 had made preparations in view of having to abandon the Kilimanjaro and Usambara regions. These preparations included the removal of all military stores. For this purpose a light railway was built south from Mombo station on the Tanga railway to Handeni (40 m.), whence a wagon road went to Kimamba on the Central (or Tanganyika) railway. Up to nearly the end of 1915 von Lettow had thought that the new British offensive might be a landing at Dar-es-Salaam or Bagamoyo; afterwards there was no doubt that it would be in the Kilimanjaro region. To meet the attack he had, he states, a force of "about 4,000 rifles" under Maj. Kraut (the British estimated that Kraut had 6,000 rifles, 16 naval and field guns and 37 machine-guns). About 1,000 rifles were concentrated to dispute any advance from Longido.

The Germans were apparently unprepared for the turning movement executed by Van Deventer's mounted men, who got behind Taveta, and forced the enemy to evacuate Salaita hill, though on this point von Lettow asserts "our want of artillery obliged us to look on quietly while the enemy executed unskilful movements at no great distance from our front."[2] Van Deventer's movement began on March 8, and on the next day his men were astride the Moshi road behind Taveta. Salaita hill was evacuated by the Germans on that day and new positions were taken up by them covering the gap between the North Pare mountains and Kilimanjaro. Von Lettow himself, with the bulk of his force, was at Himo, five m. from his front, and he was aware that behind him Gen. Stewart's column was advancing. That column, in Gen. Smuts's plan, was to cut off von Lettow's retreat, and in view of the greater distance it had to cover had started from Longido on March 5. Stewart's column met with many difficulties, and though it had no serious encounter with the Germans its progress was much slower than had been anticipated. Meanwhile the attack on the position west of Taveta was delivered on March 11. The road to Himo and Kahe passed between two hills, Reata and Latema. Maj. Kraut held both

[1] The "Cape Boys" are coloured men, all with a strain of white blood, from the Cape Province.

[2] It is to be observed that von Lettow's record of the campaign appears not to have been written till after the close of the war, and there are indications that knowledge subsequently gained colours his record of events.

hills and the pass or nek between them; no turning movement was possible and the order was given to Gen. Malleson, commanding the 1st Brigade of the 2nd East African Division, "to clear up the position and, if possible, make good the nek." The whole region was densely bushed. The advance began at 11:45, and the 130th Baluchis and the 3rd King's African Rifles were sent forward to seize a spur of Latema. The defence was very strong and by 4 P.M. little progress had been made. At this hour, writes Gen. Smuts, "Gen. Malleson, who was seriously indisposed, asked to be relieved of his command." Gen. Tighe then assumed personal direction of the operations. The 2nd Rhodesians, the 3rd King's African Rifles, and the 130th Baluchis now attempted to gain the Latema ridge. The enemy, well hidden in the bush, and supported by accurate machine-gun fire, kept, however, possession of the ridge. Finally, the 5th and 7th South African Infantry Battalions, brought up as reinforcements and led by Lt.-Col. Byron, were sent in to make a night charge with the bayonet. Here and there small parties, which became isolated, gained the crest. Col. Byron got within 30 yds. of the main enemy position, but with 20 men only, and was forced to retire. Tighe thereupon dug in astride the road to await daylight. At 4:30 A.M. March 12 Smuts ordered Tighe to draw back his force. This operation was in progress when news came that the enemy was in full retreat. Von Lettow states that about 11 P.M. on the 11th a telephonic message from the Raeta position informed him that the enemy had penetrated into the position in great force and that to avoid the risk of having his communications cut he ordered the troops with him, forming his left wing, to fall back towards Kahe. When he discovered the mistake made it was too late to alter his dispositions. Maj. Kraut then evacuated the Latema-Raeta position, and the whole force retired to the Kahe position, abandoning Moshi and Kilimanjaro. Gen. Stewart's division had not played the part expected; it was not until March 13 that it reached Bomba Jangombe, 25 m. N.W. of Kahe. Here Gen. Stewart was informed by telegram that the enemy had already avoided encirclement, and his force was brought into New Moshi on the 14th. On the 19th Gen. Stewart left for India. Later experience showed that the difficulties of encirclement were greater than then supposed.

Von Lettow's new position—known as the Kahe-Ruwa—stretched, S. of the Moshi-Taveta road, from Kahe railway station, near which the Ruwa (Pangani) crossed the railway, eastward along the northern end of the Pare mountains, through a region of forest, bush, swamps and rivers. On March 18 he was attacked from the Latema Nek direction by a force under Brig.-Gen. S. H. Sheppard (who had commanded the 2nd East African Brigade under Gen. Stewart) and on March 20 Gen. Van Deventer was sent westward from Moshi to turn the enemy's rear at Kahe. He reached and—after some sharp fighting—seized Kahe station on the 21st, but owing to the difficulty in getting his force across the Pangani could not cut off the enemy. On the same day Sheppard fought a very determined and apparently indecisive action on the northern front—a South African Brigade which was to have aided him "was so impeded in the dense bush that it was unable to exercise any influence on the fight" (Gen. Smuts). But under cover of night the German force was withdrawn to Lembeni station, 20 m. S. of Kahe. Von Lettow retired in perfect order with practically all his stores and guns, except one of the "Königsberg's" 4·1-in. guns, which was blown up.

The fight of March 21 marked the conclusion of the Kilimanjaro operations. They had opened the door into German East Africa and had greatly inspirited the British. They had done more, for though von Lettow's force was intact and its *moral* still high, its supply of ammunition had been greatly depleted. But at this critical moment another ship ran the blockade and brought the Germans most welcome supplies, including four 4·1-in. field howitzers, ammunition for the "Königsberg's" big guns, 5,000,000 rounds of '98 small-arms ammunition, 12 machine-guns, medical stores, provisions and clothing (for women as well as men). The ship, the "Maria," which had come *via* South America, the East Indies and Madagascar, entered Sudi Bay, near Lindi, in the far south of German East Africa, in the middle of March unobserved by the British patrolling vessels. She was discovered early in April, fired into and damaged. But she completed the discharge of her cargo, and got clear away. The value of this reënforcement to von Lettow is difficult to over-estimate.[1]

The military problem as it presented itself to Gen. Smuts and to Col. von Lettow respectively was very different. Smuts knew that the Belgians were ready to strike from the N.W. and the Nyasa-Rhodesia force from the S.W. and von Lettow was also aware of the fact. But in so large a country as German East Africa those operations were not likely for some time to affect the main forces. Von Lettow's position was comparatively simple; he could not prevent the enemy from developing his offensive in the manner he chose, but with his superior mobility he could adapt his movements to meet his foe's tactics.

Alternative Plans of Campaign: Smuts's Choice.

Gen. Smuts had four possible alternatives: (1) to advance from Victoria Nyanza on Tabora, the chief town in the interior (this was ruled out as it was thought, and proved to be the case, that the Belgians could deal with Tabora); (2) follow the enemy down the Tanga railway through Pare and Usambara (this was rejected as it was the enemy's chosen ground, and where he was strongest); (3) advance direct inland from Kilimanjaro; (4) land a force at Dar-es-Salaam and advance along the Central railway. Gen. Smuts chose the third alternative; whether it was better than the fourth is questionable. An advance along the line of the Central railway had obvious advantages. The railway traversed the protectorate in an east-west direction from end to end; its occupation would have cut the German forces in two and materially helped the operations of the Belgians and Gen. Northey. Dar-es-Salaam, the ocean terminus of the railway, lay at the mercy of the British navy; it was the capital of the protectorate; its occupation would have much political as well as military importance, and would have given the British a sea base 200 m. nearer South Africa than Mombasa and reduced land communications to a much greater extent. And the shortening of the lines of communication was a vital matter. Smuts, however, decided against Dar-es-Salaam "partly because the prevalence of the S.E. monsoon at that period (April) made a landing of a large force on that coast an operation of great difficulty, and even danger, partly because a prolonged campaign on the coast immediately after the rainy season would mean the disappearance of a very large percentage of my army from malaria and other tropical ailments."

Moreover, von Lettow by retiring along the Tanga railway had left the road into the interior "wide open and unguarded." At that time, April 1916, it was not realized that the climate of the interior was little less deadly than that of the coast, and that whatever course was adopted a large proportion of the army—especially among the white troops—would be affected by malaria and other tropical ailments. Also Gen. Smuts was misinformed as to the extent and severity of the forthcoming rainy season. Of the difficulties of communication he was well aware, and slightly to lessen them the railway from Voi to Taveta was carried through the Latema gap and joined to the Tanga railway at Kahe. This railway was completed on April 25 1916. It was cut through swamps and virgin forest and thousands of men had to be employed to keep the rails from sinking in the mud. Kahe, by rail, was 210 m. from Mombasa; from Kahe the advance into the interior had to be made by other means of transport. Smuts made large use of motor lorries.

Smuts's plan for his new campaign was, briefly, as follows: A mounted force under Van Deventer was to make a rapid advance

[1] A remarkable attempt to carry medical and other comforts to von Lettow in 1917 by air failed. Zeppelin L59 (known as "The Balkan Terror") under von Butlar, carrying supplies, left Yambol, Bulgaria, on Nov. 21 1917, crossed the Mediterranean, and keeping along the edge of the Libyan Desert, reached the latitude of Khartum on Nov. 23. Then von Butlar received a wireless message "Return, East Africa occupied." He got back to Yambol on Nov. 25, after a non-stop flight of 4,500 m. By the Egyptian authorities it was thought that the L59, which was observed passing over the oases in the Libyan Desert, intended to bomb the Assuan Dam.

S. from Arusha (a place 40 m. W. by S. of Moshi) to Kondoa Iringa—the chief strategic point in the interior of the northern part of the country—thence advance to the Tanganyika railway and turn E. along that line to Morogoro. Smuts himself, with the rest of his force, after clearing as much of the Parc and Usambara regions as was necessary for his purpose, was to turn S., parallel to the coast and E. of Van Deventer's line of advance, also converging on Morogoro. It was hoped thus to corral von Lettow and bring him to a decisive engagement. Smuts had reorganized his forces since the March operations, and no longer had the aid of Gen. Tighe, who was given a command elsewhere and created a K.C.M.G. Smuts formed his army into three divisions, the first under Maj.-Gen. A. R. Hoskins (Inspector-General King's African Rifles), the second under Van Deventer, the third under Maj.-Gen. Coen Brits. The first division was made up of the two East African Brigades; the two other divisions were composed of South African troops, supplemented by batteries of Indian and other artillery. On April 3 Van Deventer took the road across the Masai Steppe to Kondoa, which place he occupied after a smart engagement on April 19. *En route* the garrison of Lol Kissale, 17 Germans and 404 askaris with two machine-guns, had been surrounded and forced to surrender. It had been a brilliant march of some 200 m., but Van Deventer had lost hundreds of animals through horse-sickness, and though only some 80 m. from the Central railway he could advance no further. Then the rainy season set in and cut off Van Deventer for several weeks. Meanwhile von Lettow made rapid preparations to meet Van Deventer's thrust. Three companies were brought from near Lake Kivu in the N.W. and by steamer on Lake Tanganyika to Kigoma, whence they took train to Saranda (the nearest point on the railway to Kondoa), while von Lettow himself with 15 field and two mounted companies marched from Korogwe on the Tanga railway to Kimamba on the Central railway—a distance of 125 miles. Maj. Kraut remained in charge of the force left in Usambara. The rains began while the troops were on the march, but by the beginning of May von Lettow and his force had occupied a strong position a little S. of Kondoa. A good deal of minor fighting followed but neither side made a general attack. (In May, owing chiefly to the privations caused by the rains, Van Deventer could barely muster 3,000 rifles—a number inferior to that of von Lettow.) And in June, during the period of waiting, the Belgian advance towards Tabora began to have effect on von Lettow's own position. Gen. Smuts was also moving. His advance could not begin until May 18, the rains having turned much of the country into a lake. It took an armoured-car detachment under Lt.-Comm. Whittall, R.N., sent to reinforce Van Deventer, 35 days to cover 75 m. (in the dry season the journey took three days).

Van Deventer's March to Kondoa.

When Smuts advanced Maj. Kraut retired, skilfully, by the railway to Handeni. Equally skilful was Smuts's advance. The main column under Gens. Sheppard and Beves marched, through the densest bush, down the left bank of the Pangani, W. of the Tanga railway; a smaller force under Gen. Hannyngton followed the railway; a third column under Lt.-Col. T. O. Fitzgerald entered the Parc mountains through a gap (the Ngulu' gap) on the east. Outflanked, Kraut had no option but to retire; he had strongly fortified the railway line, but had, apparently, not believed that an advance along the fever-haunted valley of the Pangani was possible. By June 15 the conquest of Usambara was completed by the occupation of Korogwe, whence the Tanga railway descends to the coast plain. Smuts put off the occupation of the coast region, and had already with his main force turned S., and on June 19 Handeni was occupied. On June 24 a determined effort was made to round up Kraut's force, the Germans being attacked simultaneously on three sides. In this action the Kashmiris and the 25th Fusiliers (familiarly known as "the Old and Bold") earned special distinction. The Germans fought with great determination, and when the day was lost scattered in the bush and thus escaped. They reformed in strong positions in the Nguru hills.

Gen. Smuts's Main Operations.

After this fight Gen. Smuts was compelled to halt, forming a large standing camp on the Msiha river. The force had covered about 250 m. since May 22; water was short and the transport had reached the limit of its capacity. Malaria had greatly reduced the force—several units had no more than 30% of their original effectives—and the troops were on half rations. The interval of enforced idleness at Msiha camp was utilized in clearing Smuts's left flank; that is, the northern coast region. This was done by Indian and African troops under Brig.-Gen. W. F. S. Edwards (Inspector-General of Communications), with the help of the Cape squadron, now under Rear-Adml. E. F. Charlton. At this time Gen. Smuts had already reached the conclusion that white troops were not best suited for campaigning in tropical Africa (nor were the Indian troops particularly suited for the work), and that a much larger negro element was needed. By his direction the raising of new battalions of the King's African Rifles was undertaken, but the need was urgent for immediate reinforcements by trained black soldiers. These were found in West Africa. The Gold Coast Regiment had volunteered for service soon after its return from the Cameroon campaign; its offer was accepted and it sailed in June for East Africa and was in action in July. At the end of Aug. volunteers were called for a Nigerian overseas contingent and there was a ready response, but the Nigerian Brigade could not reach East Africa till Dec.–Jan. 1916–7. Meantime a battalion of the West India Regiment and the Gambia Company had joined Smuts. The coast operations, in which the navy played a great part, were successful; Tanga was occupied on July 7, Pangani on July 23, Sadani on Aug. 1 and Bagamoyo—the terminus of the old slave road from the great lakes—on Aug. 15. The British base was removed to Tanga, a saving of 75 m. sea voyage and over 200 m. rail transport. Dar-es-Salaam was occupied on Sept. 4, but it took three months before the port could be used as the new base.

While Smuts was still at the Msiha river von Lettow had brought most of his force from Kondoa to the Nguru hills. An attempt to surprise the British camp was unsuccessful owing to "the remarkably dense bush." When on June 24 Van Deventer, reinforced, resumed his offensive the German detachments left on his front gave way, nor was their retreat marked by the skill usually displayed by the Germans in their retirements. Van Deventer was delayed by the difficulties of transport, but by the end of July he was in possession of some 100 m. of the Central railway—from Kilimantinde to Kikombo,—and on Aug. 9 had concentrated his division for an advance E. on Morogoro. Farther W. the Belgians were beginning to close in on Tabora. Von Lettow was obliged to leave his forces in that region to their fate, but (at the end of June) he had sent reinforcements to the detachments opposing Gen. Northey's advance from the south. His own position now appeared critical. He withdrew Maj. Kraut and most of his force S. to Kilosa, on the railway, W. of Morogoro, leaving Capt. Schulz, with a few companies, to oppose Gen. Smuts, who resumed his advance on Aug. 5. Von Lettow's plan was to get away with as much of his stores as he could. Kraut's force did not remain at Kilosa, but crossing the railway struck S. in the direction of Mahenge, a military station in the middle of a healthy plateau, to which plateau the detachments which were opposing Northey were falling back.

Gen. Smuts's effort, to use his own words, "to bottle the enemy up in Morogoro" failed. Schulz, after fighting an action at Dakawa on the Wami river on Aug. 16, retired on Morogoro, leaving a broken bridge across the Wami. Smuts sent forces to outflank von Lettow, but in vain. When on Aug. 26 the British occupied Morogoro it was to find it abandoned, and partly destroyed, by the enemy. Von Lettow had gone with his force into the Uluguru mountains, which lie immediately S. of Morogoro, by a track the existence of which was unknown to the British. With von Lettow was Dr. Schnee, the governor.

Von Lettow Avoids Encirclement.

Gen. Smuts had taken measures intended to prevent von Lettow getting away from Morogoro by roads leading E. and W. of the Uluguru hills; he had not anticipated a retreat into the hills themselves. Brig.-Gen. Enslin was sent with the 2nd Mounted

Brigade to guard the western exit from the hills. This movement von Lettow had foreseen and had posted troops to meet an advance in this direction. Meanwhile the rest of his men, with as much of the stores as could be collected, were being moved through the mountains to Kissaki. To prevent von Lettow's escape E. of Morogoro Smuts's main force had crossed a waterless desert 25 m. long, a move which the enemy had not expected, and it was this march which caused the hurried evacuation of Morogoro. Exhausted as were his men Smuts determined to make another effort to corner von Lettow. For some three weeks very bitter fighting continued in the Uluguru hills, in which the Germans gained several successes, but on Sept. 15 Kissaki, with considerable stores, was captured by the British. Von Lettow could neither remain in the fertile and healthy hill region nor escape W., but he was able to retreat S.E. towards the Rufiji, where he formed an extensive camp on the further side of the Megeta river, which he continued to occupy for months. In short, the limit of endurance had been reached by Gen. Smuts's troops, further pursuit was impossible and the second rainy season was approaching. "Gen. Smuts," writes von Lettow, "realized that his blow had failed. He sent me a letter calling upon me to surrender, by which he showed that as far as force was concerned he had reached the end of his resources."

Von Lettow is entitled to his deduction, but by his energy and driving force Gen. Smuts had surmounted obstacles which appeared insuperable, and in conjunction with the Belgians and Northey had conquered fully two-thirds of the German protectorate, including the chief areas of European colonization and both the railway lines. This had been done in a period of seven months, and was a very considerable achievement. Civil administrations were set up in the conquered regions.

The operations of the Belgians had been carefully planned and were thoroughly successful. While such troops as were available were engaged in defending, as best they could, the Congo frontiers, a special force of a little over 10,000 men—all natives of the Congo—was raised and officered by Europeans. All supplies for this force, except food, had to be imported, a long and tedious process. A railway completed in Sept. 1915 from the upper Congo to Lake Tanganyika gave some help as, for example, when two small, fast and comparatively heavily armed British motor boats were taken from Cape Town to Tanganyika in sections. These boats took nearly six months to complete the journey of some 3,000 m. from the Cape to Tanganyika. Launched on the lake in Dec. 1915[1] they soon obtained mastery of its waters, by capturing, sinking or bottling up the enemy steamers. This achievement was of much assistance to the Belgian operations.

The Belgian Advance to Tabora.

The organization of the new Belgian force was confided to M. Tombeur, acting Vice-Governor-General of Katanga, and an ex-officer, who in Feb. 1915 was made commander-in-chief of the Belgian Congo troops with the rank of Colonel (subsequently Major-General). All the fighting men were infantry and gunners—there were, all told, 60 machine-guns and 12 field pieces. The force was divided into a Southern Brigade (under Lt.-Col. Olsen) and a Northern Brigade (under Col. Molitor). Olsen's brigade was stationed along the Rusizi river, between lakes Kivu and Tanganyika; Molitor's N. of Kivu along the Congo-Uganda border. Tombeur's headquarters were established at Kibate, just N. of Lake Kivu. Molitor's brigade was partly stationed in British (Uganda) territory. It had the help of the Congo Carrier Corps, consisting of natives of Buganda (of whom 8,429 served in the corps), while Gen. Smuts made himself responsible for supply arrangements to Molitor's headquarters, which were at Lutobo, 150 m. W. of Victoria Nyanza. This was a great advantage as from Mombasa to Lutobo is barely 1,000 miles.

The defence of the region had been entrusted to Maj.-Gen. Wahle, whose "western command" extended from Lake Nyasa to the Uganda frontier. Von Lettow had withdrawn part of the troops to strengthen his main force. Wahle, whose headquarters were at Tabora, was instructed not to risk a decisive action, but, when compelled, to fall back on Mahenge. From about mid-July to the end of Oct. Wahle was cut off from his chief.

[1] The Belgians also launched a small vessel on Tanganyika.

The terrain for the first part of the Belgian operations was extraordinary. North of Kivu rise the Mfumbiro mountains, a range of lofty, active volcanoes; farther N.E. extends a tangled mass of hills, for the most part heavily wooded, and numerous small lakes and rivers. On the German side was the mountainous, fertile, and thickly populated region of Ruanda—but newly conquered and still preserving its native government. A narrow passage between Lake Kivu and the Mfumbiro mountains afforded the only practicable route for the invasion of Ruanda from the N. side of the lake; from the S. side there was an easier approach. Col. Molitor's plan was to attack from both sides of Kivu and to make a third advance from Lutobo. The campaign began on April 4 with holding attacks by Maj. Rouling at the N. end of Kivu, where the Germans, under Capt. Wintgens, held very strong positions at Kissenji along the little river Sebea. Then the two other columns were set in motion, and to avoid being trapped Wintgens had to evacuate the Sebea lines. By the middle of May the Belgians by their converging movements had "nipped off" Ruanda. They next repeated the manœuvre on a larger scale. Olsen crossed the Rusizi at the N. end of Tanganyika and pressed E.; Molitor sent columns S.W. to join up with him and at the same time sent other columns S.E. to Victoria Nyanza, which was reached on June 27. Capt. Godovius, the German commander in Karagwe, who for nearly two years had conducted guerrilla warfare with the British Lake Detachment near the western Uganda frontier, falling back, tried to pierce the Belgian lines. His detachment sustained very heavy losses, and Godovius, severely wounded, was taken prisoner. The detachments under Wintgens, though badly mauled, escaped the Belgian cordon. By the middle of July the Belgian columns had secured the Tanganyika-Victoria Nyanza line and were ready for a further advance. Olsen's brigade marched S. parallel to Lake Tanganyika on Kigoma—the lake terminus of the railway from Dar-es-Salaam and the port of Ujiji.

In its harbour was the "Graf von Götzen"—launched in 1915 and the biggest boat ever seen on Tanganyika, the "Adjutant" (the vessel brought in sections from Dar-es-Salaam), and the tug "Wami." From June onwards they had been bombed by British seaplanes manned by Belgians. Olsen's brigade occupied Kigoma on July 28 and Ujiji on Aug. 2, the German garrison retiring by the railway to Tabora, 200 m. east. Other Belgian detachments now crossed Tanganyika S. of Ujiji, and these and Olsen's brigade advanced on Tabora.

Molitor's brigade, whose objective was also Tabora, had the coöperation of a British column under Brig.-Gen. Sir Charles Crewe, a South African soldier, who was on Gen. Smuts's staff. With a force of about 1,800 men Crewe captured Mwanza, the German port on the southern shores of Victoria Nyanza, on July 14. Thereafter the Molitor brigade marched W. and Crewe's column E. of the road leading from Mwanza to Tabora. Both forces suffered from transport difficulties, excessive heat and lack of water, and both had to fight several stiff actions. Tabora[2] was the most important and the largest place in the interior of German East Africa. The Arabs had a large colony; there were Greek, Genoese and Indian traders and representatives of many African tribes. To lose the place would be a severe blow to the

[2] The Germans had sent the enemy civilians they interned and also many of their soldier captives to Tabora. The British Europeans interned numbered over 200, a large proportion being missionaries, women as well as men. All the Europeans—there were Belgians, Italians, French and Russians as well as British—were harshly treated, but the British were subjected to calculated indignities, with the object of lowering British prestige in the eyes of the natives. The Indian and African prisoners of war were treated with open brutality. One Brandt, commandant of Tabora, was directly responsible, but his action appears to have been approved by Dr. Schnee, and it was not till the Belgians were approaching Tabora that Schnee ordered better treatment of the prisoners. Von Lettow seems to have had no responsibility for the ill-usage of the prisoners. There was, howeve-, first-hand evidence that at the prisoners' camp at Chiwata he took no steps to put an end to the inhumanity with which the Indian prisoners were treated.

Germans in Arab and African eyes, but though they fought strong delaying actions with Olsen's brigade W. and Molitor's brigade N. of Tabora they had no intention of holding out to the last, and in preparation for departure Gen. Wahle employed British, Indian and African prisoners in building a road towards Mahenge and established food dépôts along it. On Sept. 18 Wahle evacuated Tabora, leaving behind about 150 white (German) soldiers, some sick, some simply war-weary, a number of civilians (among them Frau Schnee), many prisoners of war and considerable military stores. The Belgians occupied the town the next day. Sir Charles Crewe's column, which, it was hoped, would have reached the railway line E. of Tabora before the Germans had time to get away, only struck the line a week later. Shortly afterwards the column was broken up and Sir Charles Crewe returned to South Africa. He had, said Gen. Smuts, "rendered very useful service." The Wintgens column in its retreat was engaged by a Belgian detachment at Sikonge, 40 m. S. of Tabora. Though Wintgens suffered serious loss he made good his escape. With this action the Belgian campaign of 1916 ended, just at the close of the dry season and at the same time that Smuts suspended his operations against von Lettow. Gen. Tombeur's organization had been thorough and methodical, and Cols. Olsen and Molitor had proved capable commanders. The Congo Carrier Corps was disbanded and returned to Uganda.

Northey's Campaign.

When the Germans evacuated Tabora the operations conducted by Gen. Northey from the Nyasaland-Rhodesian border had so far developed that some of Northey's columns were interposed between Tabora and Mahenge. Northey had taken the offensive on May 25 (1916). His fighting force was about 5,000 strong; it was made up of King's African Rifles (1st battalion), South African troops (infantry), Nyasa and Rhodesian volunteers, the Northern Rhodesian Police (natives under European officers), the British South African Police (Europeans), and, later, a battalion raised from the natives of northern Rhodesia. For the supplies of this small fighting force the administrations of northern Rhodesia and Nyasaland were responsible. Some idea of the effort required is seen from the fact that up to July 1917, out of a total native population of scarcely 2,000,000 in the two districts named, 395,000 were employed as carriers. Much of the supplies had to be carried, in canoe or on foot, fully 600 miles.

Northey's forces were in two main columns: a Nyasaland column under Maj. (temporary Lt.-Col.) G. M. P. Hawthorn, and a Rhodesian column under Lt.-Col. R. E. Murray. A third column under Lt.-Col. T. A. Rodgers coöperated with Col. Murray. The advance was along the 200 m. front between lakes Nyasa and Tanganyika; there was a great deal of detached fighting, some German commanders, in von Lettow's opinion, too easily surrendering. Bismarckburg, the German port at the S. end of Tanganyika, was occupied by Col. Murray on June 8. Northey's main thrust was along the highroad which led from the Nyasa frontier by Neu Langenburg and Iringa to Kilosa on the Central (Tanganyika) railway—the road crossing the Tabora-Mahenge route. In an action on July 24 at Malangali Northey defeated the German force which sought to bar his progress, and on Aug. 19 the British seized Lupembe, a place 100 m. W.S.W. of Mahenge. On Aug. 29 Iringa was occupied. Exactly a week earlier Van Deventer had taken Kilosa, 120 m. N.E. of Iringa. Northey could have reached Iringa much earlier, but on Gen. Smuts's advice he "slowed down."

When von Lettow had been forced to take to the lower Rufiji district, it was decided that a joint effort should be made by Van Deventer and Northey to deal with the enemy in the Mahenge district. But before that operation could be undertaken—Van Deventer's men were nearly spent after over six months' fighting, marching, privations and illness—Northey had to meet the troops of Gen. Wahle coming from Tabora. The Germans were in three columns, an eastern under Maj. von Langenn, a centre column under Wintgens, and a western under Lt. Huebener. Wahle was with the centre column. The western column lost touch with the others, which acted in close coöperation. Northey's columns near Iringa were much outnumbered. Although Col. Rodgers with a small body of South Africans made an effort to hold up the enemy on the night of Oct. 21 1916 the larger portion of Gen. Wahle's troops broke through the British lines. An attack made by Maj. Kraut the same day on Mkapira, in the Lupembe region, was regarded by the British as evidence of his knowledge of Wahle's movements; von Lettow states that this was not the case. The attack on Mkapira ended in a severe reverse to the Germans, but sharp fighting with Wintgens' column continued in the Lupembe area till the middle of Nov., by which time the Germans had occupied a chain of posts covering Mahenge, extending over 200 m., and facing Van Deventer's and Northey's troops. Huebener's column was still W. of Northey's lines, in the neighbourhood of Lake Rukwa. This was a region where there were neither British nor Belgian troops, and for weeks the British had been doubtful even of the existence of this column. It was eventually tracked down at Ilembule by Col. Hawthorn and bluffed into surrendering. It numbered 54 Europeans and 249 askaris, and the booty included a 4·1-in. howitzer (one of the guns from the "Maria").

The combined attack by Van Deventer and Northey against the Mahenge force was at length begun, on Dec. 24. The operation failed, though one of Northey's columns compelled the surrender of Maj. von Grawert and his detachment of 289 fighting men, including 39 Europeans. The main engagement was fought by Van Deventer's force—South African infantry and mounted men. The fight was at Muhanga, 70 m. N.W. of Mahenge. It began on Christmas Day and continued till Dec. 28. The Germans were attacked front and rear, but, as Gen. Smuts wrote, "eventually escaped through the dense bush and forest under cover of darkness and eluded pursuit." The rains had begun and early in Jan. (1917) the operations had to be abandoned. Gen. Wahle had now under him in the Mahenge area 6,000 or more soldiers, of whom at least 1,000 were Europeans, with a large following of carriers, and he found some difficulty in feeding them all. To relieve the pressure he directed Kraut and Wintgens to take detachments S. towards the Portuguese frontier, and Kraut, crossing Northey's lines, reached the Rovuma, where supplies were found. Wintgens had separated from him and turned N.W. (*see* below). All this time communications between Wahle and von Lettow were slow and irregular.

British Forces re-organized: Changes in the Command.

Since the abandonment of the pursuit of von Lettow at the end of Sept. (1916) Gen. Smuts had been engaged in reorganizing his army and in shortening lines of communication by making Dar-es-Salaam his base. He evacuated 12,000 to 15,000 white troops (South Africans), their place being taken by the Nigerian Brigade (under Maj.-Gen. F. H. Cunliffe) and new battalions of the King's African Rifles. The German ports S. of Dar-es-Salaam had been occupied by the navy in preparation for a new offensive. Of these ports the chief were Kilwa and Lindi, Kilwa being the nearest to Dar-es-Salaam. A considerable force had been concentrated at Kilwa by mid-Nov., when Gen. Hoskins took over command in that area. On Jan. 1 1917, in conjunction with Van Deventer's and Northey's operations in the Mahenge region, Gen. Smuts opened a new offensive against von Lettow, Hoskins coöperating from Kilwa in the rear of the Germans. Smuts tried an enveloping movement on the Mgeta river, but again, after very stout fighting, the enemy got away; they were followed up towards the Rufiji and engaged on Jan. 4 at Beho-Beho, in which fight F. C. Selous was killed at the head of his company of 25th Fusiliers. Though severely handled the Germans "again slipped past" and crossed the Rufiji at Kibambwe. The operations continued and were proceeding favourably to the British until the rains turned much of the valley of the Rufiji into a vast lake; and in that region, uncomfortably enough, von Lettow was able to maintain himself.

In the middle of these Jan. operations Gen. Smuts gave up the command. At the request of Gen. Botha he went to England to become a member of the Imperial War Cabinet. Having handed over the command in East Africa to Gen. Hoskins Smuts sailed from Dar-es-Salaam on Jan. 20 for London. Gen. Van Deventer left East Africa at the same time, returning to South Africa.

Brigade to guard the western exit from the hills. This movement von Lettow had foreseen and had posted troops to meet an advance in this direction. Meanwhile the rest of his men, with as much of the stores as could be collected, were being moved through the mountains to Kissaki. To prevent von Lettow's escape E. of Morogoro Smuts's main force had crossed a waterless desert 25 m. long, a move which the enemy had not expected, and it was this march which caused the hurried evacuation of Morogoro. Exhausted as were his men Smuts determined to make another effort to corner von Lettow. For some three weeks very bitter fighting continued in the Uluguru hills, in which the Germans gained several successes, but on Sept. 15 Kissaki, with considerable stores, was captured by the British. Von Lettow could neither remain in the fertile and healthy hill region nor escape W., but he was able to retreat S.E. towards the Rufiji, where he formed an extensive camp on the further side of the Megeta river, which he continued to occupy for months. In short, the limit of endurance had been reached by Gen. Smuts's troops, further pursuit was impossible and the second rainy season was approaching. "Gen. Smuts," writes von Lettow, "realized that his blow had failed. He sent me a letter calling upon me to surrender, by which he showed that as far as force was concerned he had reached the end of his resources."

Von Lettow is entitled to his deduction, but by his energy and driving force Gen. Smuts had surmounted obstacles which appeared insuperable, and in conjunction with the Belgians and Northey had conquered fully two-thirds of the German protectorate, including the chief areas of European colonization and both the railway lines. This had been done in a period of seven months, and was a very considerable achievement. Civil administrations were set up in the conquered regions.

The Belgian Advance to Tabora.

The operations of the Belgians had been carefully planned and were thoroughly successful. While such troops as were available were engaged in defending, as best they could, the Congo frontiers, a special force of a little over 10,000 men—all natives of the Congo—was raised and officered by Europeans. All supplies for this force, except food, had to be imported, a long and tedious process. A railway completed in Sept. 1915 from the upper Congo to Lake Tanganyika gave some help as, for example, when two small, fast and comparatively heavily armed British motor boats were taken from Cape Town to Tanganyika in sections. These boats took nearly six months to complete the journey of some 3,000 m. from the Cape to Tanganyika. Launched on the lake in Dec. 1915[1] they soon obtained mastery of its waters, by capturing, sinking or bottling up the enemy steamers. This achievement was of much assistance to the Belgian operations.

The organization of the new Belgian force was confided to M. Tombeur, acting Vice-Governor-General of Katanga, and an ex-officer, who in Feb. 1915 was made commander-in-chief of the Belgian Congo troops with the rank of Colonel (subsequently Major-General). All the fighting men were infantry and gunners—there were, all told, 60 machine-guns and 12 field pieces. The force was divided into a Southern Brigade (under Lt.-Col. Olsen) and a Northern Brigade (under Col. Molitor). Olsen's brigade was stationed along the Rusizi river, between lakes Kivu and Tanganyika; Molitor's N. of Kivu along the Congo-Uganda border. Tombeur's headquarters were established at Kibate, just N. of Lake Kivu. Molitor's brigade was partly stationed in British (Uganda) territory. It had the help of the Congo Carrier Corps, consisting of natives of Buganda (of whom 8,429 served in the corps), while Gen. Smuts made himself responsible for supply arrangements to Molitor's headquarters, which were at Lutobo, 150 m. W. of Victoria Nyanza. This was a great advantage as from Mombasa to Lutobo is barely 1,000 miles.

The defence of the region had been entrusted to Maj.-Gen. Wahle, whose "western command" extended from Lake Nyasa to the Uganda frontier. Von Lettow had withdrawn part of the troops to strengthen his main force. Wahle, whose headquarters were at Tabora, was instructed not to risk a decisive action, but, when compelled, to fall back on Mahenge. From about mid-July to the end of Oct. Wahle was cut off from his chief.

[1] The Belgians also launched a small vessel on Tanganyika.

The terrain for the first part of the Belgian operations was extraordinary. North of Kivu rise the Mfumbiro mountains, a range of lofty, active volcanoes; farther N.E. extends a tangled mass of hills, for the most part heavily wooded, and numerous small lakes and rivers. On the German side was the mountainous, fertile, and thickly populated region of Ruanda—but newly conquered and still preserving its native government. A narrow passage between Lake Kivu and the Mfumbiro mountains afforded the only practicable route for the invasion of Ruanda from the N. side of the lake; from the S. side there was an easier approach. Col. Molitor's plan was to attack from both sides of Kivu and to make a third advance from Lutobo. The campaign began on April 4 with holding attacks by Maj. Then the two other columns were set in motion, and to avoid being trapped Wintgens had to evacuate the Sebea lines. By the middle of May the Belgians by their converging movements had "nipped off" Ruanda. They next repeated the manœuvre on a larger scale. Olsen crossed the Rusizi at the N. end of Tanganyika and pressed E.; Molitor sent columns S.W. to join up with him and at the same time sent other columns S.E. to Victoria Nyanza, which was reached on June 27. Capt. Godovius, the German commander in Karagwe, who for nearly two years had conducted guerrilla warfare with the British Lake Detachment near the western Uganda frontier, falling back, tried to pierce the Belgian lines. His detachment sustained very heavy losses, and Godovius, severely wounded, was taken prisoner. The detachments under Wintgens, though badly mauled, escaped the Belgian cordon. By the middle of July the Belgian columns had secured the Tanganyika-Victoria Nyanza line and were ready for a further advance. Olsen's brigade marched S. parallel to Lake Tanganyika on Kigoma—the lake terminus of the railway from Dar-es-Salaam and the port of Ujiji.

In its harbour was the "Graf von Götzen"—launched in 1915 and the biggest boat ever seen on Tanganyika, the "Adjutant" (the vessel brought in sections from Dar-es-Salaam), and the tug "Wami." From June onwards they had been bombed by British seaplanes manned by Belgians. Olsen's brigade occupied Kigoma on July 28 and Ujiji on Aug. 2, the German garrison retiring by the railway to Tabora, 200 m. east. Other Belgian detachments now crossed Tanganyika S. of Ujiji, and these and Olsen's brigade advanced on Tabora.

Molitor's brigade, whose objective was also Tabora, had the coöperation of a British column under Brig.-Gen. Sir Charles Crewe, a South African soldier, who was on Gen. Smuts's staff. With a force of about 1,800 men Crewe captured Mwanza, the German port on the southern shores of Victoria Nyanza, on July 14. Thereafter the Molitor brigade marched W. and Crewe's column E. of the road leading from Mwanza to Tabora. Both forces suffered from transport difficulties, excessive heat and lack of water, and both had to fight several stiff actions. Tabora[2] was the most important and the largest place in the interior of German East Africa. The Arabs had a large colony; there were Greek, Genoese and Indian traders and representatives of many African tribes. To lose the place would be a severe blow to the

[2] The Germans had sent the enemy civilians they interned and also many of their soldier captives to Tabora. The British Europeans interned numbered over 200, a large proportion being missionaries, women as well as men. All the Europeans—there were Belgians, Italians, French and Russians as well as British—were harshly treated, but the British were subjected to calculated indignities, with the object of lowering British prestige in the eyes of the natives. The Indian and African prisoners of war were treated with open brutality. One Brandt, commandant of Tabora, was directly responsible, but his action appears to have been approved by Dr. Schnee, and it was not till the Belgians were approaching Tabora that Schnee ordered better treatment of the prisoners. Von Lettow seems to have had no responsibility for the ill-usage of the prisoners. There was, howeve-, first-hand evidence that at the prisoners' camp at Chiwata he took no steps to put an end to the inhumanity with which the Indian prisoners were treated.

Nov., witnessed the hardest fighting of the whole campaign in East Africa. Relentlessly pursued by Hannyngton's columns von Lettow was compelled to fall back to the Lukuledi valley, the chief line of retreat being towards Nyango, a place 40 m. S.W. of Lindi, towards which Beves was pressing back Wahle's detachments. Early in Oct. Hannyngton detached the Nigerian Brigade (with which was the Gambia Company) to march to Nyango and join the Lindi force. Meanwhile other columns of the Kilwa force, including cavalry, were marching S., but further W., towards the mission stations of Lukuledi and Massasi. At those places, and at Chitwa, S. of the Lukuledi river, were most of the German supplies.

The Fight at Mahiwa.

The Nigerian Brigade, after a fine march of 80 m., reached its destination on Oct. 15. On that day two columns of Beves's force under Gen. O'Grady and Col. Tytler respectively had driven back Wahle's main body to Nyango and Mahiwa (the latter about two m. from Nyango). The Nigerians were to coöperate in cutting off Wahle's retreat (preparatory to the pursuit of von Lettow), and were in action early on the 15th. This was the beginning of a four days' battle, the most stubborn and most costly of the whole campaign. Von Lettow with four companies had gone to the help of Wahle, and attacks were met by counter-attacks; the Nigerians at Mahiwa being driven back and very hard pressed. Nyango the Germans abandoned on the 16th, only to take up stronger positions on a ridge two m. S. on the farther side of a river bed. These positions the British in vain assailed; they were in turn counter-attacked on the 17th and again on the 18th and compelled to fall back to the river bed, the enemy pressure continuing until after dark. Gen. Beves gave orders that the attack was to be resumed on the 19th. This order was cancelled by Gen. Van Deventer, and on the same day the command of the Lindi force was transferred to Gen. Cunliffe. On that day the Germans retired to the positions they had taken up on the 16th. The battle was over. Out of a total strength of 4,900 infantry engaged the British had 2,700 casualties, of which 528 were in the Nigerian Brigade. The 25th Fusiliers, reduced to a remnant in previous fighting, had 70 casualties out of 120 men who went into action. Von Lettow says that the German force was "some 1,500 men" and their casualties 519. This did not include all Wahle's casualties in the retreat to Mahiwa, for on Oct. 15–8 the British captured in all 241 Europeans and 677 askaris. The total German force engaged was not fewer than 2,800. Von Lettow describes this fight as, next to Tanga, the most serious defeat suffered by the British, and says he adapted his tactics to those of Gen. Beves, who "threw his men into action regardless of loss of life and did not hesitate to try for a success . . . by repeated frontal attacks." He (von Lettow) abandoned the idea of "an annihilating pursuit" as he learned that the enemy columns in his rear were threatening the Lukuledi mission station. He hastened to its relief and began the process of concentrating his forces to the Chiwata region. The Mahiwa-Nyango battle gave him this advantage—it was 10 days before Gen. Cunliffe was able to resume the offensive. On Oct. 24 von Lettow had a conference with Dr. Schnee, who appears to have urged that the end had come, but, writes von Lettow, "I firmly stated my opinion that . . . the war could and must be carried on."

Mahenge cleared of the Germans.

Meanwhile Tafel's force had been driven from the Mahenge plateau with the help of troops furnished by the Belgians, whose coöperation had been sought. While columns of Northey's force, under Cols. Hawthorn and Fair, pressed the enemy hard from the S. and S.W., the Belgians struck at Mahenge from the north. The main Belgian column, under Maj. Batille, left the Central railway on Aug. 15, and made good progress through very difficult country. The Germans put up the usual strong rear-guard delaying actions, but when the Belgians attacked (Oct. 8) the last defence of Mahenge, Tafel ordered a general retreat. His losses had been heavy and many of his askaris deserted. Both Hawthorn and Fair were drawing near, but Tafel succeeded in outdistancing his pursuers, whose long lines of transport had reached breaking point. Tafel chose the only route open to him—that leading S.E. in the direction of von Lettow. On Nov. 16 he broke through two weak detachments of Northey's force which gallantly endeavoured to bar his progress. A Belgian column, which had been sent round *via* Kilwa to Liwale, arrived only in time to engage Tafel's rear-guard. This was the end of the Belgian effort, and their troops shortly afterwards returned to the Congo. The pursuit of Tafel was taken over by the Kilwa force and his attempt to join von Lettow was frustrated.

Von Lettow escapes to Portuguese Territory.

At this time, mid-Nov., von Lettow's position was critical. The Lindi force had resumed its offensive on Nov. 6 and had joined hands with the Kilwa force on Nov. 12. Von Lettow had concentrated all his men near Chiwata, but to remain there meant certain disaster. So leaving only a small body at Chiwata to put up a delaying action—the place was taken by Gen. O'Grady on Nov. 14—he retreated eastward, *i.e.* towards the coast, along the broken edge of the Mkondi Plateau. He was pursued without pause and constantly engaged, suffering losses every day, was in a foodless region and had lost nearly all his stores. On Nov. 17 von Lettow took what he calls a fateful decision. It was to abandon all idea of fixed bases; reduce his force—half-starved and very short of ammunition, break off fighting and get away to some district where food was to be found. At a place called Nambindinga he left some hundreds of Europeans (many of whom, he states, were not unwilling to lay down their arms) and 600 askaris, and with the rest again eluded his pursuers by turning S.E. "by an unsuspected path." While the British columns were re-forming to pick up his trail he marched rapidly S.W., having determined to cross the Rovuma near its confluence with the Lujenda, where was the Portuguese fort of Ngomano. At Nwali he shed more of his troops, and his force was now reduced to approximately 300 Europeans, 1,800 askaris and 3,000 bearers and other natives, including women and children. He marched along the Rovuma to the selected crossing place, and on the night of Nov. 25–6 he crossed the river into Portuguese territory. Gen. Wahle, Maj. Kraut and other tried leaders were with him and also Dr. Schnee. Two attempts to overtake him "failed by a few hours at both places, in spite of hard marching." So wrote Col. G. M. Orr, commander of one of the pursuing columns.

Tafel's Surrender.

For a day or two Tafel and von Lettow had been near one another; Tafel had reached the Rovuma but not finding von Lettow turned back. Running into an Indian patrol Tafel again tried to turn south. But his force was foodless and hopeless. On Nov. 27 a party of 37 Germans, 178 askaris and 1,100 followers gave themselves up to the British, and the next day, Nov. 28 1917, Tafel himself surrendered unconditionally with 19 officers, 92 other Europeans, over 1,200 askaris and some 2,200 other natives.[1]

Not a single German combatant was left in German East Africa, and the conquest of the Protectorate was complete. At the time of his flight into Portuguese territory von Lettow states that he received a second summons to surrender. But he was no more ready to surrender to Van Deventer than he had been to Smuts; moreover, he considered his position satisfactory inasmuch as he could still contain a large enemy force.

Campaign in Portuguese East Africa.

The failure of the Portuguese to prevent von Lettow from crossing the Rovuma, or in accounting for him when he had crossed that river, was not due to lack of effort on the part of the Lisbon Government. During 1914–5 they had sent over 2,000 white troops to Mozambique, and between May and July 1916 another force 4,600 strong was sent from Lisbon. Part of this force had occupied Nwali (Oct. 1916), but had been forced to evacuate it a month later.[2] In 1917 Portugal sent 8,776 more men from Lisbon, and had strengthened the posts along the Rovuma, including that at Ngomano. But the Portuguese white troops

[1] A party of six Europeans and 20 askaris under Capt. Otto broke away from Tafel the night before his surrender and eventually joined von Lettow.

[2] Urgent instructions were sent by the Lisbon Cabinet to the Portuguese commander, Gen. Gil, to coöperate with Gen. Smuts. The original idea was that Gen. Gil should march on Lindi.

lacked experience; there were not sufficient trained native soldiers and the military posts were widely scattered. Nor was any one post equal to a successful defence against the 2,000 and more veterans von Lettow had with him. Ngomano was attacked, and it surrendered after a gallant resistance in which some 200 casualties were suffered, including the commanding officer, Maj. Pinto. Its loot gave the Germans just what they lacked—food, ammunition, rifles, machine-guns and clothing. The Nigerians and the 25th Cavalry being in pursuit von Lettow then marched up the Lujenda valley. He had no difficulty in keeping ahead of the enemy, and the rainy season having set in the Nigerians and 25th Cavalry were recalled in the third week in Jan. (1918) and the Germans had a short breathing space.

Gen. Van Deventer now sent home all his white and Indian troops, and the Nigerian Brigade also. Except for the Gold Coast Regiment (which was not sent back till Aug.) the 1918 operations were carried out almost entirely by natives—the King's African Rifles. There were, however, a considerable number of Europeans among the Portuguese forces, which were put under the supreme command of Van Deventer.

Given the character and extent of the country into which the Germans had entered, the known determination of von Lettow to continue the struggle and the proven difficulty of bringing him to a decisive action, "the 1918 campaign," said Van Deventer, "had perforce to be one of virtual extermination." Wide converging movements were undertaken. Gen. Northey sent columns from the E. and S. shores of Lake Nyasa, while the Gold Coast Regiment advanced W. from Port Amelia (a harbour midway between the Rovuma and Mozambique). This Port Amelia column was later strengthened and came under command of Brig.-Gen. Edwards. Between Feb. and the middle of May the Germans were engaged at several points from both sides, mainly in the central region between the Lujenda and Msalu rivers. Von Lettow then marched S. to the Lurio river, 200 m. from the point where he had left German territory, with no enemy in front of him except isolated Portuguese posts, from which he obtained more valuable supplies. He was pursued from the N., and an Anglo-Portuguese column started N.W. from Mozambique (to which port Gen. Edwards removed his base) to overtake him. But von Lettow, marching very quickly S., captured Ilie, and in June reached the coastal region near Quilimane (Kilimane), where he ravaged many rich *prazas*. In this month Gen. Northey left, having been appointed governor of British East Africa and Col. (Brig.-Gen.) Hawthorn took his place. On July 1 von Lettow attacked a mixed Portuguese and British force at Nhamacurra, 25 m. from Quilimane, and after three days' fighting captured the place and inflicted very severe loss on the defenders. The approach of strong British columns then compelled von Lettow to retire. He marched parallel to the coast, in the Mozambique direction. He established himself at a place called Chalaua, but when in mid-Aug. British columns closed in upon it, it was to find the camp evacuated. Von Lettow had turned N.W. again, one of his ideas at this time being to raid the Blantyre district of Nyasaland. On Aug. 30 and 31 he was engaged by part of Hawthorn's force at Lioma, E. of Lake Shirwa, and suffered severely. "It was hoped that the enemy might have been captured, but the rugged country and the thick bush made operations very difficult, and he finally broke away to the northward."

Save that he could not replace his casualties (except to some extent by turning bearers into askaris) von Lettow held the advantage in this campaign in northern Portuguese East Africa. It was nearly as large as France, most of it was fertile, and the natives, richly rewarded with booty from captured posts, were friendly and useful. If hustled from one area there were others to which he could move. He was tied to no base and was an ideal guerilla leader. He had now, end of Aug., to decide his future course; he came to the conclusion that an attempt to invade British Nyasaland was too risky, as there the British communications were good. It was easier to go north. To reënter German East Africa would be a complete surprise to the enemy, who would imagine he was making for the Tabora region (where most of his askaris came from) and take precautions accordingly. This would give him an opportunity of turning in another direction, and keep his force in being. His casualties at Lioma had numbered 95, and he had lost stores, baggage and ammunition. By Sept. 1 his total strength had been reduced to 176 Europeans and 1,487 askaris. He suffered further loss in another encounter on Sept. 6, after which date he got clear of his pursuers. Gen. Hawthorn had sent troops by steamer up Lake Nyasa, which should have reached the N. end of the lake before von Lettow could get there; the steamers broke down, and when on Sept. 28 the Germans again reached the Rovuma they were able to overcome the weak posts stationed there. Avoiding places held in strength by the British, and keeping ahead of the columns now in hot pursuit, von Lettow passed round the N. corner of Lake Nyasa, losing many carriers by desertion but recruiting a few askaris. He stayed at Ubena some days and then (Oct. 17) set out for Rhodesia.

Von Lettow's Surrender.

(At Ubena Gen. Wahle and two other Europeans, sick or wounded, were left behind.) On Nov. 1 von Lettow attacked Fife, just within the Northern Rhodesian border, hoping to capture its stores, but it was too strongly held, so the Germans turned S.W., making for Kasama, von Lettow now having some idea of penetrating into Belgian Congo. Kasama was taken on Nov. 9, but British columns were in its immediate neighbourhood and there were several patrol encounters. Necessity urged von Lettow onward. On Nov. 13 he was reconnoitring a crossing of the Chambezi (the eastern head stream of the Congo) when an English motor-cyclist arrived with a message from Gen. Van Deventer announcing the conclusion of the Armistice. Von Lettow notified his acceptance of the Armistice on Nov. 14; the formal surrender was made to Gen. Edwards at Abercorn on Nov. 23. The force which surrendered numbered 30 officers and 125 other Europeans, 1,165 askaris, and 2,891 other natives, among them 819 women, with one small field gun, 24 machine-guns and 14 Lewis guns. Those who surrendered included Dr. Schnee and Maj. Kraut.

The troops employed by the Allies in East Africa included 52,339 sent from India (among them 5,403 British) and 43,477 South African whites. Other white troops employed (East African and Nyasaland settlers, Rhodesian volunteers and the 25th Fusiliers) numbered about 3,000, the African troops (King's African Rifles, Nigerians, Gold Coast Regiment, Gambia Company,

Troops Employed by the Allies.

Cape Corps—1,600 strong—and West Indians) about 15,000; an approximate total of 114,000, not reckoning Belgian native troops—about 12,000 in all—the Portuguese and the naval force engaged. The greatest number in the field at any one time, May to Sept. 1916, was about 55,000; the lowest number, in 1918, was some 10,000, all African, save the administrative services. The total British and Indian casualties was officially returned at 17,823; of these 2,762 were among the South African Forces. These figures are exclusive of casualties among carriers and of deaths and invaliding through sickness, which among the South Africans alone exceeded 12,000.

The cost of the campaign to Great Britain, inclusive of Indian and South African expenditure and that of the local protectorates to March 1919, was officially estimated at £72,000,000.

AUTHORITIES.—*British.*—The despatches of Generals Smuts, Hoskins, Van Deventer, Northey, of the High Commissioner for South Africa (Lord Buxton), the Governor of Nyasaland (Sir George Smith) and of Adml. Charlton, published in the *London Gazette*, cover the operations, except the period up to March 1916, on the British East Africa frontier and the early naval operations, concerning which no despatches were issued. "*The Times*" *History of the War*, chaps. 155, 183, 206 and 276, covers the whole campaign. Brig.-Gen. J. H. V. Crowe, *Gen. Smuts' Campaign in East Africa* (1918), has an introduction by Gen. Smuts and an account of the blockade runners. For the German treatment of prisoners, etc., see the White Paper, Cd. 8689 (1917); E. F. Spanton, *In German Gaols* (1917), and J. H. Briggs, *In the East Africa War Zone* (1918). For particular units see A. Buchanan, *Three Years of War in East Africa* (1919), chiefly about the 25th Fusiliers; Sir Hugh Clifford, *The Gold Coast Regt. in the East African Campaign* (1920); W. D. Downes, *With the Nigerians in East Africa* (1919); G. M Orr, "The Indian Army in East Africa," *Jnl. U.S. Inst. India* (1919).

EASTERN EUROPEAN FRONT CAMPAIGNS.—Under this heading comes the general story of the campaigns of the World War which were fought between 1914 and 1917 on the front between the Baltic and the Black Sea. Till the summer of 1916, Rumania was neutral, and the theatre of war was limited on the S. by the northern extremity of that country. Thereafter, till the conclusion of the peace of Brest, the Russian and Rumanian fronts became one.

The story falls into three main parts, of which the first is considerably the most important. These are:—the open-warfare, free-manœuvre campaigns from the outbreak of war till the establishment of a continuous trench line and the setting-in of trench-warfare conditions, along the whole front in Oct. 1915; the trench-warfare operations on the Russian front from that date to the peace of Brest; and the Rumanian campaigns of 1916 and 1917. The events of 1918 belong rather to the story of the Russian civil wars than to that of the World War, and may be summarized for the present purpose in two clauses—the occupation of the Ukraine, for its economic exploitation, by German and Austrian forces, and the maintenance of a cordon, requiring large numbers of troops, along the frontier of Bolshevik Russia to provide against the contingency of a new eastern front being built up by the Entente and the Soviet Government, or by either singly. As an active element in the operations of the World War, the eastern front closes its history with the battle of Riga in the autumn of 1917, and this event, therefore, is taken as the limit of the present article.

I. The Theatre of War

The operative contrast between the eastern and the western theatres of war lies less in the greater distances and areas of the former than in the fact that there Nature's handiwork has not been greatly modified by man's, whereas in France and Belgium there is an intense network of main roads and railways, and in many parts a great industrial development that has covered the country with factories, mines, tramways and workmen's suburbs. Hence arises a peculiar distinction. Strategically, the western theatre is penetrable everywhere; tactically, it is in many parts so tangled that coherent operations are nearly impossible. In the east, on the contrary, it is strategy that is difficult and tactics that are simple.

The importance of area and distance must not of course be ignored. Without counting Rumanian territory the theatre measures 650 m. x 320 m.—a six weeks' march under peace conditions from flank to flank, and a three weeks' march from front to rear. This and the unfamiliar sound of the place and river names to western ears have tended to make the operations of the eastern front seem more difficult to understand than they really are. In fact, the course of operations was largely dictated by geography, and the map, rightly read, shows the lines of geography to be drawn in bold, strong strokes. And even in point of distance, the E.-W. depth of the theatre is not more than 1½ times the distance covered by the Germans in their 1914 sweep through Belgium and France, and only half that covered by the *Grande Armée* in its march from the Rhine to Austerlitz in 1805. The picture of the operations of 1914–17, therefore, is not too large for comprehension, and the meanings of its parts are usually clear.

The broadest characteristic of the eastern theatre is its division into four well-defined regions. (*a*) The great central salient of Poland on and W. of the middle Vistula. (*b*) The Pripyat or Rokitno marshes, an area of 240 x 160 m. which, though largely reclaimed in modern times and therefore penetrable to a certain extent for tactical purposes, constitutes an almost insurmountable barrier to strategic movements on a large scale. Lying behind the Polish salient, these marshes, as it were, hollow out its base, leaving on either hand two avenues or corridors:—(*c*) the northern, connecting Petrograd and Moscow with northwestern Poland, and (*d*) the southern, connecting Kiev and S. Russia with Galicia and S.W. Poland. To the right and left rear of the salient (*a*) the two corridors (*c*) and (*d*) lie exposed on their outer flanks to hostile attack from E. Prussia and Galicia respectively, except in the portions nearer to their eastern entrances where the hostile frontiers curve away to the sea and to Bessarabia. Across the base of both corridors and in rear of the central marshes runs a water barrier consisting of the western Dvina and the Dnieper lines, unbroken save for the narrow gap at the watershed traversed by Napoleon in 1812. This waterline marks the eastern limit of the theatre. Its western limits, which espouse the shape of the salient, lie inside the frontiers of Germany and Austria-Hungary and may be taken as the lake region of W. Prussia, the Oder and the Silesian and Carpathian mountains. This limiting line, in contrast to the eastern, has several gaps, of which the most important is that lying between the Silesian and the Carpathian mountains—which is the gate to Vienna, and, owing to the higher cultural development of Germany and Austria, is strategically more penetrable even where geographical obstacles exist.

Across the whole width of the theatre, cutting off the salient from the corridors and the marshes, runs an almost straight barrier of water, constituted by the Vistula and its tributary the San, from the Baltic to beyond Yaroslav, and by the Dniester from the lakes S.W. of Lemberg to the Black Sea. The only gap is between Yaroslav and the lakes of Grodek.

All railways connecting the salient with the interior of Russia, whether they approach by the northern corridor, the marsh or the southern corridor, converge on the Warsaw–Ivangorod portion of this waterline and thence make south-westward for Upper Silesia. Practically all railways from S. Russia to Austria-Hungary, on the contrary, traverse the gap of Grodek–Yaroslav. The only line from Russia to the German Baltic lands enters E. Prussia at Wirballen at the broad entrance of the northern corridor; and similarly, at the other end of the theatre, a line from Bessarabia comes into the Bukovina system at Czernowitz. Apart from these two, the whole length of the northern corridor is traversed by three lines from Dvinsk, Polotsk and Orsha respectively ending at Warsaw and Ivangorod; the central marshes by one from Gomel which at Brest-Litovsk merges with the third of the northern lines; and the southern corridor by two from Kiev and Berdichev respectively which at Kovel become one, ending at Ivangorod. The significance of the various lateral lines connecting these approach lines is best judged by studying the map, and here it is enough to draw attention to (1) the line along the eastern base itself; (2) the line Baltic–Shavli–Vilna–Minsk with its accessory Vilna–Baranovichi–Rovno; (3) the line Kovel–Brest-Litovsk–Osowiec–Lyck–Memel (4) the line Ivangorod–Warsaw–Mlava–Danzig; (5) the line Skierniwice–Lowic–Wloclawek–Danzig. It should also be noted that, in the salient, no lines exist W. of Lodz and N. of Czenstochowa, and that in the northern corridor about Grodno and Augustowo the Prussian and Russian railways carefully avoid contact. Of the road system, it may be said, broadly, that first-class roads are not numerous, and that they group themselves, in the main, on the same axes as the railways. In the area N.W. of Lodz–Czenstochowa, however, roads to some extent mitigate the absence of railways, and about Augustowo the connexion with E. Prussia, which the railways avoid, is, as regards roads, intimate.

Within each of these broad divisions—the salient and the two corridors—other natural features exercised a considerable influence. The chief characteristic of the northern corridor is the practically continuous waterline which defends its flank from attack from E. Prussia. Leaving the Vistula at Novogeorgievsk below Warsaw, this line is formed by the lower Bug, the lower Narew, the Bobr, the lakes of Augustowo and Suwalki, the middle Niemen to Sredniki, the Dubissa, the Vindavski canal which crosses the low Shavli watershed, and the Venta prolonged by the Vindava to the Baltic. From the Niemen section to Novogeorgievsk almost every important crossing—there are

not many—is protected by permanent fortification of some sort. Its most vulnerable section is that at which the E. Prussian frontier makes contact with Augustowo–Suwalki–Kovno–Grodno. South of this region, on the stretch Rozan–Lomsha, owing to the absence of railways and first-class roads, military operations were never principal, but always dependent upon either those of Suwalki and Augustowo or those astride the Warsaw–Mlava–Danzig line. North of Kovno, at the broad entrance to the corridor, it was safe against all but secondary attacks, so long as Kovno held out and kept the attack toward Shavli.

Frontally, of course, the corridor was protected by the Vistula and its fortresses Ivangorod, Warsaw and Modlin or Novogeorgievsk (this last at the origin of the flank barrier just described), and behind this frontal defence were other successive lines—the middle Bug, the middle and upper Narew, the upper Niemen and its feeders, the Vilia system—not to mention partial barriers such as the Wieprz. But most of these rear barriers, in particular the Bug, tend in their upper course to turn *southward*, thus opening to an invader who stands N. of the San a series of successive gates along the inner edge of the corridor, by which penetration is possible to Bialystok or even to Baranovichi. Hence the special importance attaching, in the operations of 1914–5, to the lower San sector and the fortress of Brest-Litovsk.

The southern corridor, unlike the northern, lies partly on one side of the political frontier and partly on the other. No important natural barrier prevents either an Austrian irruption from the S. as far (roughly) as the line Lublin-Kovel-Sarni, or a Russian irruption through and past Lemberg (Lvov) to the Dniester. As has just been mentioned, the left wing of such an Austrian irruption has the opportunity of seizing the gates of the northern corridor; no reciprocal advantage offers itself to the Russians since the Dniester line is doubled by that of the Carpathians. But, in particular, the fact that the whole Lemberg region is within the Austrian frontier narrowed the corridor normally open to the Russians to a mere strip of country. To protect this from being cut off from behind, the Russians had constructed a triangle of fortresses Rovno–Dubno–Lutsk. At its front end, where it joins the northern corridor and the salient, Ivangorod, Brest-Litovsk, and minor river courses and marshes were relied upon to seal the region of Chelm and Vladimir Volynsk; in effect, a drive by the Austrians into that region if pressed too deep laid open its flanks to counter-attack both from Ivangorod and from Lutsk (Luck).

The geography of the interior of the marsh area needs little description. As above mentioned, much of it is tactically penetrable, but owing to the extreme paucity of communications, as well as to its physical difficulties, it is on the strategic plane essentially an obstacle and not a field of manœuvre. Its outstanding geographical feature is its river system; the Pripyat itself runs W.–E., but it has numerous N.–S. tributaries notably on the S. side, and these tributaries sometimes form, with tributaries of the Dniester (flowing in the opposite direction), N.–S. waterlines of defence only broken at the watershed (Brody, for example) along which run the communications between Rovno and Lemberg.

In the forepart of the central salient, too, it is the waterlines that are the most important features. The course of the upper Warta; that of the Pilitca; the position of Lodz (or rather Lenczyska) at the divide of the Warta and Bzura systems; the course of the Nida meeting at its mouth the mouth of the Dunajec, one of the several Galician rivers which double the San obstacle; lastly, the upper Vistula itself which forms the southern boundary of the salient—all these were important.

Practically the whole of this region belongs to the W. Russian plain, and has marshy valleys, feeble undulations, and great forests, some of these last still existing in primeval density, others already broken up by man's clearings and settlements. The only hilly mass is the Lysa Goza in the Kielce region of the salient. On the contrary, the Lemberg–Brody–Buczacz portion of the southern corridor, and all country between the San or Dniester and the Carpathians, is almost wholly a country of deep-cut valleys and high plateaux.

The German reëntrant opposed to the Polish salient is geographically similar to, but in point of human development very different from, that region. In Silesia, owing to its industrial character, the network of roads and railways is as dense as in western Europe. Without going west of Posen, no less than three complete lateral or circumferential railways join Upper Silesia to the trans-Vistula railways of E. Prussia. As, in face of these, no Russian lateral exists W. of Lodz it is easy to see how this region, in spite of its want of natural defences, was able to act as a curtain between the two bastions of E. Prussia and Galicia, facilitating quick transfers of the centre of gravity from flank to flank and itself (save at one critical moment) immune from attack because of the difficulty of approach.

Of these two " bastions," E. Prussia was the more important as menacing the whole length of the northern corridor, from front to rear. Whereas the Lemberg region only projects from the San–Dniester barrier, E. Prussia has its whole length at right angles to the Vistula. It is served by so many railways that either end of this length is utilizable for the offensive.

The principal directions which this offensive may take are—from the eastern end of the province towards Shavli, from the same towards Kovno and Grodno, and from Mlava towards the Narew and, if and when that obstacle is overcome, on Siedlce or Bialystok. We have seen that the first of these is inevitably a secondary or dependent operation. Between the other two the choice was always, for the German Command, difficult. Presuming the Narew forced, or Kovno taken, as the preliminary in either case, the one offensive leads close into the rear of the Warsaw–Ivangorod stronghold, while in the other the corridor is seized far back near its entrance; the choice therefore depended on how deeply the enemy was advanced in the Polish salient or how long the passive front of the " curtain " could be held, or what chance there was of coöperation from the lower San through the Bug " gate," and on other factors which had to be reckoned together on every occasion that an offensive was planned. But these two avenues (Kielce or Warsaw-Mlava, and Vilna-Kovno [or Grodno]-Insterburg) equally serve for Russian offensives, and the defensive characteristics of E. Prussia were nearly if not quite as important as its qualities as an offensive base.

The main feature of military geography in E. Prussia is the chain of the Masurian lakes which, in a sickle from N. to S. and then westward, protects the interior against attack from the E. or the S.E. The tongues of land which separate the lakes represent only a narrow frontage which has actually to be defended, and have the effect also of gathering communications, plentiful in the interior, at a few points of exit. To the S. of the lakes a number of tributaries of the Bobr–Narew system continue the water barrier, as against eastern attack, to the Narew; to the N. of them the river Angerapp presents a similar barrier as far as the Pregel, beyond which river smaller streams continue the line of defence with some gaps to the Niemen. Behind the lakes, the next important N.–S. barrier is the line of the Alle which, rising in the central Masurian lakes, runs to the Pregel at Wehlau, whence from Tapiau to the Kurische Haff runs the Deime. Other partial barriers to an invader's westward progress exist but are of less importance. Finally there is the German section of the lower Vistula which, intricate at Danzig and fortified at Thorn and Graudenz, still bars access to Germany proper when E. Prussia has been conquered or evacuated.

Thus on the E. this province is singularly well protected. But it is to be noted (1) that the frontier, especially in the northern part, lies well in advance of the barrier, and that a policy of passive defence on the lake line forfeits a not inconsiderable region at the outset; and (2) that both the Insterburg–Johannisburg line and the Alle are turned by attack from the S., by Mlava and Soldau, where the westernmost part of the lake system dies away. At the centre of the "sickle," on the other hand, the density of the lakes is highest and they not only afford local protection to this part of the region, but also enable the defending army to shift its weight from E. to S.W. and vice

versa without much fear of flank attack in doing so; while, on the Russian side, the paucity of communications in the foreground of these central lakes seriously impedes liaison between the northern or Gumbinnen and the south-western or Soldau groups of the invaders. Such shifts of the centre of gravity are, moreover, facilitated by the dense railway system lying behind the lakes. The frontier railway, which runs from Thorn, by Soldau, Johannisburg and Lyck (junction of the Russian Bialystok–Brest-Litovsk transversal), to Tilsit and Memel, lies outside all defensive barriers. But inside the barriers are some three other transversals, one being the Thorn–Insterburg–Wirballen section of the Berlin–Petrograd main line, and the others parts of a well-developed provincial system.

The military-geographical characteristics of the Lemberg region, the other potentially offensive base lying outside the Vistula–San–Dniester barrier, are less sharply marked and their influence is not so definite. Offensive possibilities lie in the direction of (*a*) Bessarabia, (*b*) Kiev, (*c*) Kovel, (*d*) the inner edge of the northern corridor, towards Brest-Litovsk. Of these, as in the case of E. Prussia, (*a*) is eccentric, except as a secondary element of (*b*); and (*c*) centres on a region which is ill-developed in communications, and therefore operations there are subsidiary to those on either flank. The important alternatives are therefore, speaking broadly, (*b*) and (*d*). In (*b*) Dubno and Rovno play the same rôle as Kovno in the N., and the results to be expected from a successful operation of this character are similar to, but smaller in scale than, the corresponding enterprise on the Niemen. (*d*) The operation, twice carried out and several times contemplated, offered many results and many risks, and its usefulness varied according to a number of factors like that of the corresponding operation from the N., with which, in fact, it was logically combined.

Defensively, the conditions of the Lemberg region were similar in some respects to those of E. Prussia. Waterlines opposed invasion from the E., while from the N. Lemberg was open. But the real obstacle value of the E. Galician watercourses,—Gnila Lipa, Zlota Lipa, Strypa, etc.,—whose names were to become historic, is small, and, though N. of the Styr system and the uppermost streams of the Bug (Styr) have wide marshy valleys and are serious barriers, the watershed itself (Dubno–Brody–Lemberg) is an open gate both for road and rail approach to the Galician capital.

The railway system of the Galicia theatre, though far inferior to that of Silesia and Prussia, included two complete laterals N. of the Carpathians, and at least one S. of them. From the interior of Hungary and Moravia, over the Carpathians, to the San–Dniester barrier there were eight approach railways between Teschen in the W. and Czernovitz in the E., and four of these pass the barrier at or near the Grodek gap, converging on Lemberg and Rava Ruska. In the latter region itself the railways lie chiefly radially from Lemberg. It is to be noted that on the whole front N. of Lemberg the Russian frontier region is destitute of approach railways.

Finally, the Carpathians (of which Galicia to the San, to Lemberg and to the Dniester, is simply a glacis) are not as the sea is to E. Prussia, a definitive barrier, but rather a wall with many gates for the passage of an invader into Hungary and Austria. The mountains themselves are rather Vosgian than Alpine, and their main passes are low enough to be practicable for railways. At the W. and E. ends, the mountains broaden out into the Tatra and massifs, but in the centre the mountain zone is at its narrowest, and it is exactly in front of this that the Grodek gap breaks the forward barrier and allows these railway approach lines to make for the Hungarian plain. West of the Tatra massif, the Troppau gap opens Moravia to an invader who has mastered Upper Silesia. (C. F. A.)

II. The Campaigns of 1914

The Russian Plan of Campaign.—Two characteristics of the Russian Army were admitted on both sides as axiomatic, the relative slowness with which its total forces could be brought to bear and the numerically overpowering superiority of those forces when assembled and ready. Both these were summed up in the popular phrase of 1914, which likened the Russian Army to a steam roller. The axioms were not, however, independent. Only by waiting could the overpowering strength be realized, and by temporarily forgoing this numerical advantage, it was possible for the Russians to act with partial forces and provisional objectives, almost if not quite as promptly as the armies of the Central Powers. Instead, therefore, of the usual stages of couverture and full-power action there would be, or might be, three —couverture, rapid partial action, and delayed full-power action—and the application of the geographical factors to strategy varied accordingly.

In all alternatives, the inclusion of the central salient, either in the couverture system or in the deployment for the main action, was impossible. In other words, it was militarily evacuated from the outset. In the alternative of delayed full-power action, the couverture would guard the outer flanks of the two corridors and the Warsaw–Ivangorod–Lutsk front, while the main masses assembled further back. Flank-guard groups would prolong the defence of the corridors respectively in the Shavli region and to the S.E. of Dubno and Rovno. The line of detrainment for the main bodies would be, substantially, Kovno–Grodno–Bialystok–Brest, and (for the Southern armies) points behind Rovno. But the abandonment of so large a portion of Poland would only be necessary in the case of Germany's employing the major portion of her forces in the east. In that case, especially if it arose in winter, it was calculated that the Russian forces on the couverture line would have to retire fighting, giving up Warsaw and possibly Ivangorod, but holding firmly at all costs on the middle Niemen front and at Brest. If that case did not arise, then the couverture was strong enough to enable the main masses using the northern corridor to detrain further forward. In proportion as the arrangements for mobilization and concentration were improved in the years 1910–4, and in proportion also as it became more probable that Germany would elect to employ the bulk of her forces on her French front, not only this forward concentration but also preparatory offensives delivered from the couverture line came to be considered.

In all cases the main object which was to be sought when the forces were fully assembled was practically the same. It was the destruction of the Austrian armies in Galicia, the occupation of the Carpathian line, and eventually an advance into Moravia and Silesia by Troppau and the Oder head, turning Breslau. The exact form in which this ultimate offensive would be realized could not be foreseen until the Germans and Austrians had shown their hand; meantime, the problem before the Russian general staff was so to plan their couverture arrangements, their detrainments, and their now feasible preparatory offensives as to subserve this purpose.

Generally speaking, the couverture on the Narew-Bobr, that on the middle Niemen, and that in the Shavli region were disposed and directed to checking as long as possible any German attack on the flank of the northern corridor. It would be reënforced *in situ* to the strength of two armies and an independent group. If powerful German attacks developed it would offer an elastic defence, on one line after another, to protect at all costs the region of Bialystok–Grodno–Vilna during the troop movements in that area. If not, it was to take the offensive and, by conquering E. Prussia to the Vistula, definitely to secure the right rear of the future main effort. This conquest was to be carried out from the S. by Mlava, turning the lake barrier, by one army while the other pressed up against the front of the lakes and the Angorapp, so as to occupy the Germans and at any rate to prevent a rush upon Kovno and Grodno. The independent group about Shavli was to deal with minor enterprises of the enemy in its own area, and especially with landing threats on the Baltic coast as far as Riga. From that point inclusive, coast defence was entrusted to another army, with headquarters at Petrograd.

In the centre two armies, coming from the interior by the central and eastern railways of the corridor, were, if possible, to

concentrate about Lublin and Chelm respectively; otherwise they were to divide, one going to the right of the defensive wing about Shavli, the other continuing S. to Brest and Kobryn. Supposing that this proved unnecessary, the two armies, from Lublin and Chelm respectively, were to take the offensive against the left of the Austrian armies in Galicia. The right of these meantime would be attacked by two other armies, advancing from Dubno and from Proskurov. These armies were given special precedence in their equipment, so as to be ready to act early. At Odessa, a minor army of reserve divisions was to be assembled to watch Rumania.

Defensive or offensive as the case might be, these preparatory engagements were all assumed to be in progress before the full concentration had been effected. Including the Petrograd army, only 28 out of a total of 37 active corps were comprised in the dispositions, and the reserve divisions formed on mobilization were not counted upon for immediate service. The remainder, in so far as no new complications occurred to tie them to their peace regions (*e.g.* Caucasus), would become successively available and constitute a mass of manœuvre or a pool of reënforcements, according to the course of events.

On mobilization, accordingly, the allocation of troops was as follows:—

I. Army (*Rennenkampf*). Niemen, including Shavli. II., III., IV., XX. Gd., I. Corps. (As soon as relieved by reserve divisions [XXVI. Corps] at Shavli, XX. Gd. was to proceed to IV. Army.)

First task: protection in front of Niemen line, on that line, or if necessary further back towards Vilna. Second task: advance to bind the German forces on the lakes and Angerapp.

II. Army (*Samsonov*). Narew. VI., XV., XXIII., XIII. Corps. First task: protection of Bobr–Narew–Bug line and reconnaissance into Mlava–Neidenburg region. In case of heavy German offensive, the region of Bialystok to be protected at all costs. Second task: invasion and conquest of E. Prussia via Mlava, turning the lakes. (These two armies had each several reserve divisions allotted.)

IV. Army (*Evert*). Concentration area Lublin. Grenadier, XIV., XVI., XVIII. Corps.

V. Army (*Plehve*). Concentration area Chelm. V., XVII., XIX., and XXV. Corps.

Both for attack of N. front of Austrian armies in Galicia.

III. Army (*Ruzsky*). Concentration Rovno–Dubno. IX., X., XI., XXI. Corps.

VIII. Army (*Brussilov*). Concentration S. and W. of Proskurov. VII., VIII., XII., XXIV., III. Caucasian Corps.

Both for attack of N.E. and E. front of Austrians in Galicia.

The I. and II. Armies formed the north-western front under Gen. Zhilinsky (succeeded after the first operations by Ruzsky), the IV., V., III., VIII. the south-western front under Gen. Ivanov, whose Chief of Staff was Alexeyev.

The VI. Army (*Grand Duke Nicholas*) was the title of the Petrograd force, the VII. (Nikitin) that of the Odessa troops.

(In the event of German offensives developing on a large scale, requiring the adoption of the rear line of rail-heads, the IV. Army was to be switched *en route* to the right of the I., and to it instead of to the VIII., the XXIV. Corps was to go. It would also become part of the north-western front.)

The peace-time scheme, as thus outlined, was at once modified in the early days of mobilization, not so much in intentions as in allocations of force. No commander-in-chief of the whole was appointed before the war, as the Tsar was undecided as to whether to take command himself. At the outbreak of war the Grand Duke Nicholas, Commander of the VI. Army, was appointed. He had taken no part in drawing up the scheme, and his own ideas differed somewhat from it. He therefore formed a new scheme, or rather a modification of the basic scheme, whereby the Guard and I. Corps were dispatched to Warsaw (instead of to the I. Army) to form the nucleus of a IX. Army, and the VI. or Petrograd Army was reduced first to one corps, and then to reserve divisions only. The first corps to leave was the XVIII., originally intended for the IV. Army but now assigned to the IX. (replaced in the IV. by the III. Caucasian Corps taken from the VIII. Army). The XXII. followed towards the end of August, joining the I. Army in lieu of the Guard and I. Corps. Further, a number of the reserve divisions accumulating behind the I. and II. Armies were constituted a little later as a X. Army with the mission of connecting the I. and II. Armies—but too late to avoid the catastrophe of Tannenberg.

Mobilization and concentration proceeded rapidly. The cavalry divisions allotted to the Prussian front were detrained complete by the 7th day of mobilization, the infantry corps by the 13th day. On Aug. 14 the Grand Duke informed the French ambassador that the I. and II. Armies would open their offensive on the morrow, considerably sooner than was expected by the French, who only began their advance on that day.

The "preventive" offensive that was to lead to Tannenberg was thus launched on Aug. 14. Its objects were, partly, the accelerated fulfilment of the original plan of campaign (at the lowest, the active flank defence of the northern corridor, now being traversed by a IX. Army as well as the IV.); and partly, the desire to aid France by startling the German command into making detachments to the E.

Plans of Campaign—Central Powers.—The problem of war on two fronts had for many years been anxiously studied in Germany and it had been generally accepted in principle that a simultaneous offensive E. and W. was impossible. In the time of the elder Moltke, the difficulty of defending the long open eastern frontier, as compared with the relative ease with which the short, strong line Thionville–Strassburg could be held, had decided the great general staff in favour of choosing the east as the offensive theatre; and this plan held the field, with few modifications, until Schlieffen came into office as Chief of the General Staff and reconsidered the military position. He decided that the first offensive must be directed against France, but in such a way as to insure the quick and complete destruction of the French army, *i.e.* by using Belgian avenues for the envelopment of its left. His solution of the two-front war problem, therefore, was to prevent its happening: neither he nor his successor, the younger Moltke, seems to have dealt exhaustively with the case that actually arose, *i.e.* that of a prolonged contest in which the centre of gravity constantly required to be shifted from E. to W. and vice versa. An important factor, perhaps the ruling factor, in the decision was the assumption that it would be impossible to bring the Russian army to decisive battle; owing to its slow assembly, the distances to be traversed in order to reach it required a time allowance which the western defensive, at grips with the highly trained and efficient French army, could not insure for it. Moreover, with unlimited space behind them the Russians were regarded as having every chance of avoiding a decision for as long as they wished to do so, and the re-distribution of the Russian peace garrisons after 1910 (which pointed to the choice of the rear line Kovno–Bialystok–Brest as the probable line of entrainment) confirmed the conclusion. Two possible offensive directions were considered, that from the Mlava region against the Narew line, and that from the lake front by Wirballen and by Augustowo and Suwalki against Kovno and Vilna. These alternatives and their meaning have been alluded to already. The choice was a difficult one, hardly to be settled except *ad hoc;* it was to be the chief bone of contention between Falkenhayn and Hindenburg in the 1915 campaign. But even the second, and more promising, line of operations would not lead to the enemy's rear if he abandoned all Poland at the outset, and concentrated between Kovno and Brest.

In fact such a course of action was provided for in the Russian concentration scheme. But the alternative preferred by the Russians was an offensive, or two offensives, carried out by the readiest portion of their forces, and their alternative naturally engaged the attention of the Central Powers in the years after 1910, when the war-readiness of the Russian army was evidently being improved with menacing rapidity. The defence against such an attack could not readily be combined by the two Central Powers because of the salient W. of the Vistula; on the defensive, therefore, Germany and Austria-Hungary formed two theatres, either or both of which might be the target of enemy offensives of uncertain power. Further, the entire peace forces of the Central Powers, taken together, were not equal numerically to the peace forces of Russia, and the adhesion of Turkey, and still more that of Rumania, to their side was problematical. If the bulk of the Russian forces concentrated on the forward line, then there were only two practical alternatives for the Central

Powers: either (*a*) to concentrate as much as possible of the German army in the E. (relying upon the short and well-fortified defensive line of Lorraine and Alsace, doubled by the Saar and the Rhine, to hold up the French), and to take the offensive with 90 or 95 divisions, German and Austro-Hungarian, as soon as possible so as to catch the enemy in the act of detrainment; or else (*b*) to stand on the defensive, each in his own theatre of war, resigned to give up territory in order to gain time for the annihilation of the French.

But that annihilation effort would require at least four-fifths of the German mobilizable forces, if it were to be carried out in the short time that the conditions of the E. allowed, and in the case of Germany the territory that would have to be resigned was E. Prussia, bound indissolubly to the Hohenzollerns and to the Prussian army by ties of sentiment and tradition. Its abandonment was "unthinkable." Yet the force that could be spared to defend it was small indeed. The Reichstag had declined to sanction the creation of the three new army corps which would have eased the problem; and, in the event, one to two corps allotted in principle to the E. were taken at the last moment for the W. In short, the German army allotted to the E. was a minimum force. But it was not on that account authorized to give up any German ground.

The case of Austria-Hungary was more favourable to this extent, that nearly the whole force of the Dual Monarchy could be employed in the defence of Galicia, unless (as actually happened) offensive action was simultaneously undertaken in the Serbian theatre. On the other hand, Galicia would clearly be the enemy's principal target, and were he to leave mere flank guards against E. Prussia, there was little doubt that even in an accelerated offensive he could employ superior forces. Many Austrian authorities therefore favoured a withdrawal of the line of defence to the Carpathians, and probably the majority considered that nothing could be held in advance of the San–Dniester barrier. The problem then was difficult and obscure, and differences of opinion both within each country and between the two countries themselves were certain. Austria's strategy even in respect of her local problems depended largely upon Germany's, and no definite, binding convention appears to have been negotiated, either for the case of the offensive or for that of the defence. More, the interchange of views which did take place led to completely disjointed action. When the inner wing of the Austro-Hungarians was driving forward the offensive on Lublin and Chelm, the Germans in E. Prussia were under orders to retreat to the Vistula.

Conrad von Hötzendorff, the head of the Austrian general staff, was essentially active in temperament, and the wave of sentiment in favour of the undiluted offensive which swept through all European armies about 1912 strongly influenced him and his entourage. A scheme was prepared under which the left portion of the Austro-Hungarian army was to take the offensive from the lower San, northward on Lublin and Chelm, flank-guarded by an échelon directed on Vladimir Volynsk; while the right portion defended Lemberg against attack from the E. In coöperation with this left wing, a German army was to advance by Mlava on the Narew line, force this, and effect a junction with the Austrian advance about Siedlce. By this scheme it was hoped either to cut off a part of the Russian army and beat other parts in detail as they detrained—if the Russians were attempting to forward concentration—or to make good military occupation of almost the whole of Poland in the shortest time—if they were concentrating on the rear line Kovno–Brest. At the lowest, Conrad held, the protection of Galicia and of E. Prussia would be best assured by the offensive.

In how far Moltke agreed to this plan is doubtful. He had definitely committed himself to the Schlieffen scheme of putting France out of action before an eastern front came into existence, and though he had considerably altered its details, he had provided even less force for E. Prussia than Schlieffen had proposed. Such evidence as is available tends to show that Moltke agreed with the scheme as the operative idea of the eastern offensive that was to follow the decisive defeat of France (expected to have been sufficiently achieved by about the 30th day of mobilization), but not as a preventive offensive to be launched while the issue in France was still undecided. Conrad, on the other hand, was determined to carry it out the moment he was ready, hoping, as he said, that Moltke would not "leave him sitting in the ink too long." The scale of the operation for him was only that of a preventive offensive, carried out substantially by about 27 Austro-Hungarian and 10 German divisions from the San and from the Mlava region respectively. This force, if it caught the Russians in the act of concentration, would create "favourable conditions for later operations" on a large scale.

Moltke, on the contrary, gave the E. Prussian Army (VIII., Gen.-Oberst von Prittwitz und Gaffron) nine active and reserve divisions (I., XVII., XX. Active Corps, I. Res. Corps, 3rd Res. Div.), for both the lake and the Mlava fronts. Apart from a number of Ersatz and Landwehr formations, most of which were intended for the defence of Thorn, Graudenz and Königsberg, this was all. In Posen province and in Silesia, there were only frontier guards of Landsturm, and the Landwehr and Ersatz garrisons of Breslau and Posen; as the salient facing these provinces was practically evacuated, no more was necessary, and indeed eight Landwehr regiments were grouped in Upper Silesia as a field force (the "Landwehr Corps," von Woyrsch) to accompany and guard the left of the Austrian offensive.

Thus, the first campaigns in the E. were distinct and without connexion of idea or of date. The battles of both being described elsewhere, it is sufficient here to outline the campaigns of Lemberg and Tannenberg in succession.

The Campaign in East Prussia; August–Sept. 1914.—The first requirement of the Russian scheme of operations being free use of the northern corridor for the assembly of forces against the Austrian left, the troops disposed on the dangerous flank of the corridor were ready for action about ten days before the date set for the completion of the Lublin–Chelm concentration. In the original scheme, their mission was primarily defensive and in the second place offensive, but as early as Aug. 9 the Grand Duke determined to push forward both the I. and II. Armies on their offensive missions, in the hope of at once compelling the Germans to hold back forces destined for the W. On the 14th, their concentration completed, these armies moved out of the detrainment areas, the I. (II., III., IV. and XX. Corps) under Rennenkampf on the axes Kovno–Gumbinnen and Suwalki–Marggrabova, the II. (VI., XV., XXIII., XIII. and later I. Corps) under Samsonov on the axis Przusznysz–Soldau. Seven to eight cavalry divisions accompanied and preceded them. At many points on the frontier from Memel to Bialla and round to Mlava there had already been local engagements, especially on the axis Kovno–Gumbinnen, where Rennenkampf on the one side and von François (commander of the German I. Corps) on the other had both strong motives for activity, the Russians to thrust back the enemy's forces as far from the "corridor" as possible, the Germans to preserve the region between the frontier and the lakes as long as possible from occupation or pillaging. On the Mlava axis these episodes were fewer, for the Russian main bodies were more distant. The Germans were unable to prevent the enemy's mounted troops from ranging up to Soldau, but their Zeppelins reconnoitred the line of advance of Samsonov's main bodies.

Gen. von Prittwitz, in spite of his small forces, was confident. He placed the I. Corps (François) facing E. on and in front of the Angerapp, the XX. Corps facing S. between Allenstein and Soldau, the XVII. and I. Res. Corps and the 3rd Res. Div. in the interior, waiting on events. To the left rear of the I. Corps, the Königsberg main reserve—an Ersatz and Landwehr force numerically, but only numerically, equivalent to a corps—moved out N. of the Pregel to Insterburg. To the right of the XX. Corps was a frontier guard, also composed of Ersatz and Landwehr belonging to the fortresses of Thorn and Graudenz. On Aug. 14 v. Prittwitz, satisfied that no important threat was impending on his S. front, turned over the defence of that front to the Landwehr and Ersatz formations of Gen. von Unger, drew the XX. Corps to Ortelsburg, in readiness for an offensive to-

wards Johannisburg, and brought the remainder of his forces to the E. front behind and on the flanks of the I. Corps, the 3rd Res. Div. (reënforced by one brigade and a screen of Landsturm posts) holding the lake barrier.

On the 17th took place the first serious encounter of large forces. Von François still maintained a forward position on the Kovno railway at Stallupönen, barely five miles inside the frontier; he was determined to defend offensively, and he inflicted a sharp blow on the central columns of the enemy before the others became effective. But his left was driven in, and Prittwitz, whose intention was by no means to fight so far forward, ordered the combat to be broken off and the troops to retire to the Gumbinnen position. There, on the 19th and 20th, the battle of Gumbinnen was fought. Claimed by both sides as a victory but in fact indecisive, since parts of each line gained successes or suffered failure, it ended in Prittwitz's ordering the battle to be broken off. To the astonishment of his corps commanders, he announced that he proposed to retreat over the Vistula. A grave crisis had arisen. The Russian II. Army, seemingly quiescent on the Narew, had in fact been cautiously advancing on the Mlava axis, which was now defended only by second-line troops and, partially, by the XX. Corps—everything else, even mobile Landwehr brigades, having been brought over to the E. front by the order of the 14th. Such was the situation of the defences when, some time after noon on the 20th, reports reached Prittwitz to the effect that four or more Russian corps were approaching Mlava and Ortelsburg. He had three alternatives—to disregard the threat, win an effective victory at Gumbinnen, and pursue the enemy in such a way as to impose caution on all Russian forces in advance of the sensitive point of the "corridor"; to leave a containing force about Gumbinnen, trust to the lake barrier, and bring back the bulk of the forces so as to strike the flank of the oncoming II. Army; or to fall back beyond the sweep of that army's manœuvre. The first alternative was eagerly advocated by von François, but the other corps had met with little success in the battle. It is probable that no reasonable hope remained of winning a thorough victory on the 21st, and nothing less would serve. The second alternative was not, at that moment, considered and the third was adopted in its most extreme form, retreat beyond the Vistula. The I. Corps was to move by train to Bischofswerder and Gosslershausen, in order to bar the road to the Vistula, the XX. to fight for time, and the remainder to withdraw south-westward under cover of these corps. A factor in the decision was the activity of Russian cavalry which, in large and small bodies, was appearing in the interior of the province.

In the *Kriegsspiel* exercises of peace-time, this problem had often been fought out, and the idea of sacrificing E. Prussia—on paper—was familiar. But, as the elder Moltke observed in 1866, "in practice one does not abandon provinces." On the 20th, apparently on the initiative of Lieut.-Col. Hoffmann of the staff of the VIII. Army, who sent a protest direct to supreme headquarters at Coblenz, Moltke communicated with Prittwitz by telephone, and urged him to try the alternative of a manœuvre on interior lines. The army commander replied that this was impossible and that he might need reënforcements even to secure an escape to the Vistula. Thereupon Moltke relieved him of his command, opened direct telephone communication with von François and von Scholtz (XX. Corps), telegraphed to General-Oberst von Hindenburg, in retirement, to offer him the command, and summoned Ludendorff (deputy chief of staff II. Army) to act as chief of staff.

This situation, in fact, was less alarming than it had been on the 21st. Neither Rennenkampf nor Samsonov displayed any important activity; and Prittwitz recovered confidence, decided to hold the line of the Passarge against Rennenkampf, and began to work out a scheme of attack against the Russian II. Army. But the order of dismissal reached him that evening.

On the 23rd Hindenburg and Ludendorff arrived at Marienburg (H.Q. VIII. Army). Already, after a conversation with Moltke, Ludendorff had (apparently on a suggestion from François) fixed Deutsch-Eylau and eastward, instead of Gosslershausen, as the rendezvous of the I. Corps and ordered all available Ersatz and Landwehr units from Thorn and Graudenz to strengthen von Unger, thus beginning to prepare a group of two active corps and other troops to check Samsonov. The other forces lately engaged at Gumbinnen were to remain, temporarily, opposing Rennenkampf—all measures designed, evidently, to arrest the sense of retreat and panic. Not until the staff of the VIII. Army had reported the situation in detail was a clear idea of possibilities formed by the new leaders. In principle the plan was adopted of holding up Rennenkampf, maintaining the lake region against any break-in from Lomzha, and concentrating offensive effort against Samsonov. Both the newcomers and the staff already on the spot were in agreement as to this. But it remained to be seen whether, and even how, it was to be accomplished. On the evening of arrival, Hindenburg reported to Coblenz "assembly of army at XX. Corps and enveloping attack planned for Aug. 26," but next evening, developing the idea in some details, he added: "morally determined but not impossible things turn out badly."

The intention was to disengage some, or even all, of the troops opposing Rennenkampf, and with them by a flank march close behind the lakes, to envelop Samsonov's right; to bring in the I. Corps and the nearest portions of von Unger's force against his left, and to hold him frontally with the XX. Corps. It was on this last that everything hinged. Short of a simultaneous effort by both Rennenkampf and Samsonov—the case feared by the Germans—pressure by the II. Army alone was of greater significance than that of the I. Army alone would be. Rennenkampf, however active, could only drive the I. Res. and XVII. Corps south-westward towards the Passarge (and the Königsberg troops into their fortress) and work a passage down the rear side of the lakes to join hands with Samsonov, whose VI. Corps was made to diverge towards Ortelsburg for that purpose. Samsonov, on the contrary, could by an energetic advance bring three corps (XIII., XV., XXIII.) against Scholtz, and in case of success break into the midst of the new dispositions of his opponent. On the 23rd-24th this seemed probable, for on those days he attacked the XX. Corps and forced it to swing back from the line Gilgenburg-Orlau to the line Gilgenburg-Hohenstein. At that moment the 3rd Res. Div. at Hohenstein and even the first arrivals of the I. Corps at D. Eylau were being drawn into the fight to assist von Scholtz. The arrival of the rest of the I. Corps, destined for the flank attack on the W., was delayed by misadventures; and this western attack (I. and Unger) was itself becoming imperilled by the advance of yet another Russian Corps, the I., from the IX. Army forming at Warsaw. Of the other German corps not one was disengaged for its southward march before the 24th.

On the 24th, however, the withdrawal from Rennenkampf's front began. It was carried out in the midst of an emigration *en masse*, main roads being so crowded with refugees that troops were marched in some cases entirely by tracks and by-roads. Russian cavalry parties were by now riding about the country as far as the Passarge.

The Angerapp line having been given up on the 22nd, the front of contact opposite the Russian I. Army now (24th) ran along the Deime and the lower Alle, astride the Pregel, to Allenburg, thence by Gerdauen to Angerburg at the N. end of the lakes. North of the Pregel, the Königsberg force was slowly retiring on its fortress and had left Wehlau. South of it there were withdrawn, each in succession and covered by the rest, the XVII. Corps, which was directed on Bischofsburg-Ortelsburg; the I. Res. Corps, directed upon Seeburg; and finally the 6th Landwehr brigade from Lötzen, the key of the lakes, to the same region. Only the Königsberg force, one cavalry brigade and some Landsturm, remained in front of the Russian I. Army.

Meantime, Samsonov continued his methodical advance, but very slowly—the VI. Corps on Bischofsburg via Ortelsburg; the XIII. on Allenstein; while the other two, followed in échelon to the left rear by the I. Corps, were sent against Scholtz (20th and 3rd Res. Div.), whose left was driven from Hohenstein. But already the two wings of the envelopment were being pre-

pared and directed according to the indications of Russian wireless messages sent in clear. On the W., the German I. Corps, with additional troops under Mülmann coming up on its right, attacked towards Usdau on the 26th. On the same day the Russian VI. Corps was met and defeated at Gross-Bössau by the oncoming eastern enveloping wing. Von der Goltz's Landwehr division, arriving opportunely from Schleswig-Holstein, was added to Scholtz's threatened flank. From the 26th the battle was general. Strategy had done its part. By the 31st the destruction of Samsonov's army by double envelopment was complete, only the attached I. Corps écheloned back on the left being outside the ring and able to escape as a formed body. Samsonov himself fell, and 92,000 prisoners and 300 guns remained in the hands of the victors.

Meantime the German supreme command at Coblenz had taken a step which is generally regarded as having been fatal to Germany's success in the war. Moltke had recognized from the first that the strength of the VIII. Army was little above, if not below, the safety limit, and in the background there was Conrad's repeated demand for effective coöperation in the Siedlce scheme. Only after much hesitation was the IX. Res. Corps in Schleswig-Holstein taken to reënforce the W. on the strength of Prittwitz's optimistic reports on the eve of the battle of Gumbinnen. Two days later came the crisis which led to Hindenburg's appointment, but at that moment the battle of the Frontiers was developing all along the line in the W. and Moltke did not suggest (nor did Ludendorff ask for) a reënforcement of the E. On Aug. 25, however, caught apparently in a wave of optimism which pervaded the armies of the W. after five simultaneous victories, Moltke decided to send no less than six army corps to the VIII. Army, not so much in order to re-establish a compromised situation there as to deal the offensive blow in the E. that was only waiting upon a decision in France. Two corps were to go from each portion of the western front, and the Guard Reserve and XI. Corps, being reported by their army commanders, after the fall of Namur, as free, were sent first, along with the 8th Cav. Div. In the event, the other four were never sent, as the results of Tannenberg altered the balance of forces in the E. at the same time as a new crisis was arising in the French theatre.

These reënforcements arrived too late for the battle of Tannenberg, but began to be available in the first week of September. Meantime the VIII. Army Command had to decide whether to pursue immediately to the southward, forcing the Narew line and making rendezvous with Conrad about Siedlce, or to deal with Rennenkampf's army which still stood, inactive but threatening, on the Deime–Wehlau–Allenburg–Angerburg–Bialla line. The latter course was preferred, as was practically inevitable. The progress of the Austrian I. Army and Woyrsch (see below) in the Lublin region was evidently being neutralized by the advance of Ruzsky and Brussilov in E. Galicia, and Rennenkampf's inactivity could hardly continue. Moreover, he occupied a great part of E. Prussia and the call of the civil population for rescue from the Cossacks could not be ignored.

Rennenkampf's halt on the Deime–Angerburg line, when enemy forces were daily slipping away from him to take part in the destruction of Samsonov's army, was and is severely criticized, and exposed him to the reproach even of treason. Part at least of the causes of this passivity lay in the inherent slowness of Russian military practice—a slowness which equally characterized the unfortunate army of Samsonov, as we have seen. For the rest, it is to be noted that the Grand Duke was himself at Insterburg during the critical days. Such evidence as is available suggests that the intention of the Russian supreme command was not to press even Samsonov's offensive, still less the frontal advance, farther than it would go, but to give the whole campaign a wider sweep by means of the new IX. Army assembling at Warsaw and intended to move on Thorn and Posen,[1] turning the Vistula barrier from the south.

[1] The I. Corps of this army was not placed at Samsonov's disposal till Aug. 26, the Guard not at all. One cavalry division was actually taken from Samsonov.

From the German point of view, although information was no doubt lacking as to the large undisclosed reserves moving in the "corridor," it must have been clear that the defeat of Rennenkampf would effectively answer any renewed threat from the S. by endangering the Grodno–Kovno artery. In the conditions of the moment this defeat could best be ensured by attacking his left wing, and in the first days of Sept. the VIII. Army with the corps from the W. were disposed accordingly on a long line from Preussisch-Eylau to E. of Willenberg: in order from left to right Guard Res., I. Res.; XI., XX., XVII., I. Corps and 3rd Res. Div. Von der Goltz with his own division and another made up from Unger's and Mülmann's forces (called 35th Res. Div.) watched the southern front on both sides of Mlava. The Königsberg force still held the Deime line. On his side Rennenkampf had already brought up two of his reserve divisions from the Niemen for the siege of Königsberg, and he now strengthened his left from both active and reserve formations assembled about Grodno. As had been the case at Tannenberg, the forces were numerically almost even. On neither side was any important condensation of force at particular points effected, and the resultant battle, known as the battle of the Masurian lakes, or of Angerburg, was practically "linear."

The idea pursued by Hindenburg was to press the Russian right, as far S. as Angerburg, with four corps, to break out of Lötzen (the key of the lakes, which had been kept throughout) with the XVII. Corps while the I. Corps and 3rd Res. Div. advanced from their Tannenberg positions eastward along the frontier railway. These 2½ corps were intended to roll up the left of Rennenkampf and press northward, with an échelon to the right against the fresh enemy forces reported detraining about Grayevo. The battle began on Sept. 7 and on the 8th was general. But the lake barrier this time favoured the Russians. The German XVII. Corps made only slow progress in advancing from the pass of Lötzen, and most of the I. Corps was soon drawn north-eastward. The balance, however, passing S. of the lakes along the axis Johannisburg–Bialla, made marked progress, and on the night of the 9th–10th Rennenkampf decided to take down his front by successive fractions from right to left, and retire into the Mariampol region whence he had come. The battle then became one of tactical incidents, with all the local vicissitudes of a general chase. At the end, thanks to the traditional rearguard aptitudes of the Russian soldier, Rennenkampf's army had flowed away to safety, leaving the bulk of the VIII. Army congested round Vladislavov and Eydtkühnen with the I. Corps E. of Vilkovishki and the 3rd Res. Div. at Suwalki. Goltz's southern cordon had meantime extended eastward as far as Marggrabowa.

The battle of the Masurian lakes freed E. Prussia, and the victors gleaned a harvest of some 30,000 prisoners in manifold combats amidst woods and lakes. But it was not a Tannenberg, and already events elsewhere were in progress which involved the VIII. Army in a general eastern front campaign.

The Galician Campaign of August–September 1914.—As has been said above, Conrad had determined to carry out the offensive in the region Lublin–Chelm, where the Russians were concentrated, though without definite assurances of coöperation from E. Prussia. In the offensive, the forces to be employed formed two armies—the IV. Army (Auffenberg), consisting initially of the II., VI., IX. and newly formed XVII. Corps, and four cavalry divisions; and (detrainment area Yaroslav–Przemysl) the I. Army (Dankl), I., V., X. Corps and two cavalry divisions (detrainment area middle and lower San).

East of Lemberg it was intended to place two armies, the II. and III. But owing to the belief that the war crisis would be limited and localized as a campaign against Serbia, the II. Army was assembled initially on the Danube, and could only be brought N. by degrees. At the outset it was represented in Galicia only by the Army-group Kövesz (XII. Corps and some extra divisions S.E. of Lemberg and on the Dniester), but the IV. and VII. Corps were being disengaged from the Serbian front and sent up gradually. The III. Army (Brudermann) E. and N.E. of Lemberg consisted of the XI., III. and XIV. Corps

and some other divisions, of which the XIV. Corps was presently taken to form the Army-group of Archduke Josef Ferdinand and placed N. of Lemberg to maintain liaison between the IV. and III. Armies, intervening as required by either.

On the left of the I. Army, along the N. side of the upper Vistula (*i.e.* in the Polish salient) an Army-group under von Kummer, formed of Landsturm troops, and to the left of Kummer, the German Landwehr Corps of Woyrsch, were to advance in the direction of Sandomir and Ivangorod respectively, driving back such Russian mounted forces as remained in this region. These formed an échelon protecting the left rear of the I. Army, but were primarily intended to form a rallying-point for an insurrection in Poland. This hope was not realized, or realized only to a small extent, and the "Polish Legion" that was formed in fact consisted largely of Galician Poles.

The Archduke Friedrich was commander-in-chief, with Conrad as chief of staff and effective director of operations. The campaign which ensued constituted in reality a chain of battles and as such is described elsewhere. Here it need only be summarized very broadly. Apart from the movement of Kummer and Woyrsch, who started early, in order to be in position at the date of the general advance, the campaign opened on Aug. 20. Prior to that date, the Austrian cavalry divisions had made many attempts to ascertain the Russian movements in the "southern corridor" and the adjacent parts of Bessarabia, but without obtaining much information. The Russian masses were in fact still in the stage of rail transport, and their mounted troops, trained to fire action and favoured by the country, easily kept the screen intact. The Austro-Hungarian offensive was therefore in its first stages carried out according to the *a priori* scheme.

The objective of the I. Army was Lublin, that of the IV. Chelm; they therefore aimed at the concentration centres of the IV. and V. Russian Armies respectively, and the conditions of this concentration led to a series of encounter battles in which the Austrian left was constantly écheloned forward, with the result on the other side that the Russian V. Army's tended to strike south-westward rather than southward, and so in turn exposed a flank to the Austro-Hungarian IV. Army. This army, again, depended for security on its right upon the Army-group (Josef Ferdinand), which was itself attracted now to the N. for intervention in Auffenberg's battle, now to the E. to protect Brudermann's exposed left. On the one side, therefore, an advance in échelon, on the other successive detrainments, produced a battle of marked day-to-day fluctuations. The I. Army in a series of combats collectively called the battle of Krasnik reached the line S. of Chodel-Borzechow-Turobin by Aug. 26, against increasing Russian resistance especially on the left nearest Lublin, where it was found necessary to bring Kummer and Woyrsch E. of the Vistula in order to strengthen the forces aiming at that place while the right advanced to Krasnostav. On Dankl's left, meanwhile, Auffenberg was advancing into the area between the Wieprz and the Huczwa, and on Aug. 26 the battle of Komarów began. In this, between Aug. 26 and Sept. 1 the Austrian IV. Army broke the Russian V. Army into two fractions, the more important of which, half-surrounded, only escaped through a maladroit withdrawal of that part of the Austrian army which had seized its line of retreat. The withdrawal of the one Russian fraction to Chelm and the other to Hrubieszow on the Bug, with heavy losses, constituted a signal victory, and would have had great results but for events in E. Galicia.

There, in accordance with the prevailing doctrines and also in order to keep Russian influences as far as possible from the Ruthenian capital, Brudermann III. Army and Böhm-Ermolli II. Army (in reality Army-group Kövesz) had been sent forward to carry out an offensive defence, although in the one army Josef Ferdinand's group was limited in its range by its liaison task,[1] and in the other the IV. and VII. Corps were still on their way to the theatre of war. This numerically weak offensive encountered the Russian III. and VIII. Armies in full force—as has been mentioned above, these armies had been given priority in equipment and otherwise—and was brought to a standstill in the battle of Zloczów (Aug. 26–27) fought on the line upper Bug-Zlota-Lipa. On Aug. 29–30 a new battle, defensive this time, was accepted and lost on the Gnila Lipa (battle of Przemyslany) and the III. Army fell back on Lemberg itself, which the supreme command thereupon decided to give up. It was evacuated on Sept. 2.

Thus Conrad was confronted with new problems. His left army (I., Kummer, Woyrsch) was already close upon Lublin, the victorious IV. Army pushing towards Chelm with its main body and Hrubieszow with its lesser half. In the region of Sokal and Rawa Ruska only cavalry activity had occurred, and Ruzsky's right wing was trending to the S., in the Lemberg direction. The beaten III. and II. Armies were assembled in good order on the strong line of the Grodek lakes (near Wereszyca), while no important attack had developed on the Dniester. There were, substantially, three courses open—to pursue the northern offensive, trusting to distance and water to make interference with the right flank impossible during the necessary time, to take down the whole northern front and come back to the Vistula-San-Dniester position; and to use the advantageous position of the IV. Army for a manœuvre on interior lines against Ruzsky's right flank. In principle, he preferred the first course, and as we have seen, he invited Hindenburg's coöperation in the still valid Siedlce scheme. But Hindenburg declined, Rennenkampf had not yet been dealt with, and opposition in front of the I. Army had visibly stiffened. The second alternative had obvious advantages and disadvantages; in the existing conditions, the disadvantages which had weighed heavily in peace-time—that E. Galicia was thereby abandoned—no longer applied since that region was now lost, and the preservation of the only available armies of the Dual Monarchy was of the highest importance. Nevertheless, Conrad chose the manœuvre on interior lines, as the VIII. German army had done. It may be that Tannenberg contributed to the decision.

The germ of this idea appeared in the orders for Sept. 2, in which the IV. Army was ordered to suspend its offensive and change its front from N. to S. in readiness for a south-westward attack towards Lemberg, or for a south-eastward retreat towards the San. At the same time the lines of communication of each army were shifted westward, so that the base of the system became the region between Cracow and the Carpathians. The effort of the I. Army to gain ground northward was not given up, so that in effect, at this date, the supreme command had not made up its mind. In the orders for Sept. 4, on the other hand, the choice was definitely made in favour of a IV. Army offensive in the Lemberg direction, though the I. Army, Kummer and Woyrsch, were still left with their mission unchanged.

On the 6th, the complicated manœuvre of the IV. Army was completed, but in its southward progress it had developed considerable opposition on the E. flank, while the W. and centre passing by Rawa Ruska and Niemirów met little or none. The result was that the army practically swung into line with the III. instead of striking from N. to S. against the assailant of that army. On the 7th, therefore, Conrad changed his plan again. The Austrian leader now proposed to take down the northern front by degrees, to use the IV. Army as a fixed pivot between Rawa Ruska and Magierów and to swing up the II. and III. Armies against Brussilov. This plan came to nothing. Russian pressure increased on the front of Woyrsch, Kummer, Dankl, and the Russian V. Army, beaten at Komarów, resumed the offensive against the group of divisions under Josef Ferdinand which had been left by the IV. Army to protect its rear. Finally, Ruzsky's right, augmented by a process of regrouping which had been going on at the same time as that of the Austro-Hungarians, emerged in great strength on and beyond Auffenberg's left, N. of Rawa Ruska. There was no surprise, as marked indications of such a move had been discovered in the southward advance of the northern army. But when the Russian V. Army, joining the general offensive, began to drive

[1] In fact, it was wholly absorbed in the battle of Komarów.

into the weakly held gap between Dankl's right (Krasnostav) and Auffenberg's left rear (group Josef Ferdinand about Lasczów), Conrad gave up the battle altogether and ordered a retreat to the line of the San and the Carpathians. The various forces along the Dniester retreated to the Carpathians, the II. Army to the region of Sambov, the III to that of Przemysl, the IV. to Yaroslav, and the I. with Kummer and Woyrsch to the lower San (Sept. 11–15).

On this line, however, no stand could be made. Already on the 14th the Russian IV. Army, strengthened from the assembling IX., had been able to force a passage of the San near its mouth. The Austrians thereupon resumed their retreat south-westward (followed up in the later stages very cautiously by the Russians) and stopped on Sept. 22 on the line of the Visloka, the Vislok and the Carpathians. Przemysl was left to be defended by its garrison. On the 26th the retreat came to an end on the line of the Dunajec–Tarnow–Gorlice–Usczie–Ruskie–Carpathians. But at that date, the German IX. Army was beginning to assemble in Upper Silesia. The eastern front had come into being.

The Vistula-San Campaign (October 1914).—In the last stages of the Marne battle Moltke had been succeeded, in effective direction of the German operations, by von Falkenhayn. Possibly because he had held, and for a time continued to hold, the office of war minister, certainly from judgment and temperament, Falkenhayn took a broad view of the eastern front problem from the first. The war, after all, had become a war on two fronts instead of two successive single-front campaigns, as had been hoped, and it would have to be conducted accordingly. This involved, first, a more intimate coöperation between the German and the Austro-Hungarian forces than had existed hitherto; secondly, the necessity of keeping the Austro-Hungarian army, in spite of its heterogeneous composition and known deficiencies, in a fighting condition similar to that of the German forces working with it; and thirdly, constant reconsideration of eastern plans, whether German or Austrian or joint, in the light of the situation on the western front; that these three were interdependent the first united operations clearly showed.

The immediate problem was to fulfil the second requirement without neglecting the third. This meant, in concrete form, the reëstablishment of the Austro-Hungarian army without bringing over forces from the west. At that moment—mid-Sept.—the battles of the Aisne were developing northward into Picardy and Artois. The "race to the sea" was in progress and the chance of decisive victory in the W. had not been lost on the Marne. On the other hand, it was clear that the Austro-Hungarian army had not only lost Galicia but had suffered very heavily in casualties and material, and was shaken by its experiences. The retreat to the Dunajec had on two occasions come near to disaster—in the early stages when the IV. Army's left flank was exposed and out of touch with the I. Army, and in the later stages when strong Russian efforts were made to drive the armies off their S.W. direction by enveloping the left flank of Woyrsch and Kummer. After reviewing various alternatives offered by geography and the railways, he came to the conclusion that to press the advance of the VIII. Army on Kovno–Grodno, *i.e.* to pursue the victory of the Masurian lakes, would not serve, and decided to form a "South Army" in Upper Silesia as a direct support to the Austrian left. At first it was intended that this should be a small army, practically no more than a reënforcement of Woyrsch, but within a few days Ludendorff's proposal to transfer the bulk of the VIII. Army to South Poland, with its implication of a serious counter-offensive campaign, was accepted. The object of Falkenhayn in agreeing to this was, by enabling the Austro-Hungarian army to reassert itself in the offensive, to gain time for achieving a decisive result in the west. The theatre in which risks were taken was, as before, E. Prussia. Hindenburg's victories had altered the situation there, and a sort of pursuit could still be maintained by a small force for some time, before the inevitable reaction set in and Rennenkampf came on again. Moreover, the barrier of the lakes and the Angerapp was now being seriously fortified, and it was to be expected that Rennenkampf could be brought to a halt on that line if not in front of it. On the Mlava side, no repetition of Samsonov's offensive seems to have been feared. But as a precaution one of the 6½ newly raised reserve corps was sent to E. Prussia, and two more cavalry divisions were extricated from the west. The forces of E. Prussia under von Schubert retained the title VIII. Army. Those in South Poland were designated the IX., under Hindenburg.

The Grand Duke Nicholas, meantime, was pursuing more and more vigorously the idea which was first evidenced in the creation of the IX. Army behind Warsaw. This army had been absorbed in the fighting against Dankl, but by now the more distant active corps as well as numerous reserve divisions were detrained and ready. Reënforcements had to be provided to enable Rennenkampf's I. and X. Armies to check and drive back the probable pursuit on the middle Niemen, and to reconstitute the shattered II. Army on the Narew. But even with these demands to be satisfied, enough remained for the constitution of an offensive group between Warsaw and Ivangorod. With this group he meant to transfer the centre of gravity to S.W. Poland, making Warsaw–Czenstochowa and Ivangorod–Beuthen the principal axes of his advance. Accordingly, in the last days of Sept. and Oct. 1, the Russian army in front of the Austrians began to be reduced.[1] And a formidable mass—the "steam-roller" for which the world waited—gathered behind the middle Vistula. Meanwhile, lighter forces, keeping level with the advance S. of the upper Vistula, had advanced beyond Kielce, Petrikov and Lodz.

The Austro-German offensive thus struck the Russians in the act of regrouping. Its plan was:—the German IX. Army and part of the Austro-Hungarian I. Army, N. of the upper Vistula, to advance, driving back all forces met with, to the line of the Vistula above and below Ivangorod, and there to form the pivot of a sweep of the Austro-Hungarian IV. (Josef Ferdinand) and III. (Borocvic) Armies which should advance to the San, relieve Przemysl, and then strike northward and north-eastward. The II. Army (Böhm Ermolli) in the Carpathians and the left of the I. Army (Dankl) on the Vistula about Zawichost were to conform to the movement as it developed. Danger of counter-attack upon the extreme left of the IX. Army from the Warsaw bridgehead was provided against partly by causing the various frontier guards of Posen, Hohensalza and Thorn to advance into Poland, partly by échceloning out a mixed force called Frommel's corps—chiefly cavalry—on the middle Pilica.

Moving out from the concentration area in Upper Silesia on Sept. 28, and joined on its right by the left of the Austrian I. Army from Sept. 30, the German IX. Army reached the line Klimontow (Austrian I. Army), Opatow (Woyrsch and XI.), Ostrowiec (Guard Res.), Szydlowice and Ilza (XVII.), W. of Opoczno and S. of Rawa (Frommel). At that date the Austro-Hungarian I., IV. and III. Armies had also begun their advance; and reached the Wisloka, while in the Carpathians the II. Army and Hoffmann's Corps to the E. of it began to dislodge the various bodies of the Russian VII. Army that had established themselves in and beyond the passes. Along the whole front only light troops of the enemy were met, and the advance continued during the following days. But, almost simultaneously, the Austrian IV. and III. Armies were brought to a standstill on the San barrier and at the gap of Chyrów which gave access to the Dniester, and both Mackensen's XVII. Corps and Frommel's mixed force advancing north-westward, came into contact with the heavy Russian forces now debouching from Warsaw.

This growing intensity of the fighting S. and S.W. of Warsaw deflected the advance of the German IX. Army northward, causing a corresponding extension of front of the Austrian I. Army, which now passed wholly to the N. of the Vistula, its left centre facing Ivangorod. On Oct. 10, the battle was gen-

[1] The III. Army (now commanded by the Bulgarian Radko Demitriev), minus several of its units, was employed in besieging Przemysl; the VII. had come up from Bessarabia and taken over the Dniester front from about Stryi eastward. Its designation was shortly afterwards altered to that of "Dniester Group," but in 1915 a new VII. Army was formed in the same region.

eral along the whole front from Blonie W. of Warsaw, by Kalvarya S. of that city, along the Vistula and the San to Przemysl (relieved on the 9th) and thence across the Chyrów gap to the Carpathians. Here and there both sides sought to force the water barrier. In most cases no foothold was obtained, but where a bridge-head could be established, or where it existed as at Warsaw and Ivangorod, effort was concentrated.

By the 14th the assembly of Russian forces about Warsaw and Ivangorod was so great that no less than three army staffs were required to direct operations—in order from right to left the I. (brought down from Kovno region), the reconstituted II. and the IV. (from the San): on the left of the IV. was the IX., on the left of this the V., while the III., VIII. and VII. (Dniester Group) held the front of the San, Chyrów and the Dniester foreground. The process continued on the following days; the V. Army, taken out of the line S. of the Vistula, was put in between the II. and IV., the IX. was brought up to Ivangorod, and more and more Russian troops passed the bridge-heads, while the thinned lines of both sides contended on the San-Chyrów-Turka front without material changes, and the opposed detachments of the Russian Dniester Group and Hoffmann and Pflanzer-Baltin fought local battles on the various routes between the mountains and the Dniester.

On Oct. 17, Ludendorff, already warned of the strength of the enemy's Warsaw armies by events and by a captured order, advised Hindenburg to retreat. The want of success on the Chyrów front indicated that the scheme for which the German IX. Army had been brought to the Vistula had failed, and the IX. Army and Dankl's I. Army were now exposed to the convergent attack, from Warsaw, from Ivangorod, and from Zawichost, of five hostile armies, while Josef Ferdinand, Boroević, Böhm Ermolli, and the forces eastward were pinned.

The retreat after a last attempt to gather a striking force on the Pilica for a blow against the Russian II. and V. Army—made at the expense of thinning the front of the Austrians before Ivangorod—set in on the 21st, and spread from left to right as far as the Vistula above Zawichost. The San-Turka line, on the other hand, continued to be held by the Austrians, fighting being concentrated principally upon the right of the II. Army, where a break-through was narrowly averted on the 27th. During the next days, the lost ground was regained; and progress was made between the Carpathians and the Dniester by the smaller forces operating there. But on Nov. 2, operations were suspended on the whole front S. of the upper Vistula.

During this period, the E. front of E. Prussia had been subjected to attack, as had been expected. Rennenkampf, advancing from Kovno and from Ossoviec as well as frontally, had pressed back the VIII. Army (von Schubert, later von François) to Kibarty and to the W. of Lyck. François, sanguine in temperament, defending his own corps district, inspired by a personal order from the Kaiser to protect E. Prussian territory, and conscious that the work in the lake defences was incomplete, was determined to hold his forward position to the last possible moment. Falkenhayn, objective in mind and uneasy in spirit, reënforced him with the new XXV. Res. Corps, which retook Lyck and Grayevo, threatening Suvalki from the south. The front then became quiet, for the Russians had no serious offensive intention. Their I. Army was already on its way to Warsaw when the German counter-advance took place, and the X. Army left to flank-guard the northern corridor was reduced in strength to 13 divisions, as compared with some 47 in Poland and 30 from Zawichost to Turka. On the Mlava front, held by von Zastrow with a Landwehr Corps called the XVII. Res., all was quiet in the period of the Vistula-San operations.

The Campaign of Lodz-Cracow-Limanova.—The retreat had been foreseen in time for the German IX. Army to make elaborate preparations for delaying the enemy's advance along the south-westerly railway lines by which, evidently, his intention was to reach Upper Silesia and the Moravian gap. In the course of the retreat the demolitions planned as well as the evacuation of stores and supplies, were carried out, if not completely, at any rate sufficiently for their purpose. But both Hindenburg's and Conrad's headquarters realized that they had now to deal with the full effort of the enemy. The "steam roller," after breakages and delays, had started. By Oct. 31 the German IX. Army had gone back to the line Syeradz-Szczerców, Novo Radomsk, Wloszczowa, Chechiny, the Austro-Hungarian I. Army to Kielce, Opatow, R. Opatowka. On Nov. 1-2 the latter was driven back from the Opatowka line, necessitating the withdrawal of the IV. and III. Armies from the San and the abandonment of the offensives in progress on the E. of the Stary Sambor region. A few days later the Russians had again invested Przemysl and were advancing to the Dunajec. The centre of gravity, however, was no longer S. of the Vistula.

The crisis brought out, in the three men who had to deal with it, Conrad, Falkenhayn and Ludendorff, the characteristic quality of each.

Conrad proposed to Falkenhayn that no less than 30 German divisions should be brought over from the W. at once, bringing Hindenburg's strength up to about 53 divisions. Forces in the Carpathians and in E. Prussia were to be economized, and the bulk of the Austro-Hungarian and German Armies were to seek decisive victory in battle in Poland. Now that the Russians had gathered, and gathered so far W., it would be possible to bring this about without fear of their retreating into the limitless interior of their own country. In short, the war could now be won in the E. It could also be lost, for unless some such decision were attempted, Conrad held that it would be necessary to retreat to the Danube. Falkenhayn, on the other hand, was becoming convinced—especially by the experience of Ypres, that the war would be a protracted trial of endurance, and must be handled on the principles adopted by Frederick the Great in the latter part of the Seven Years' War, viz. a wary, economical defensive, with offensive sorties on every favourable opportunity or necessary occasion, but no staking of all upon a throw.

If Conrad was the Lee of the Central Powers, Falkenhayn was their Johnston. Had the Southern Confederacy possessed a Grant, the parallel would be complete, for Ludendorff met the problem as Grant would have met it, by a strategy that was at once objective and grandiose. Hindenburg was now commander-in-chief of the German eastern front, and his headquarters could deal with the situation as a whole. Ludendorff's plan was to transfer the bulk of the IX. Army by the Silesian railways to W. Prussia (Thorne-Hohensalza region), whence by a sudden advance through the north-western part of Poland, he could strike upon the right or right-rear of the enemy's system. To reënforce the offensive mass, the E. front of E. Prussia was to be stripped almost bare of troops and the country in front of the lakes and the Angerapp deliberately evacuated and broken up.[1] The S. front of E. Prussia (Zastrow's and other formations) was to participate in the offensive by advancing on Plock, Ciechanov and Przasnysz, with the mission of flank-guarding the main attack on the E. side of the Vistula, and of keeping the Russian I. Army busy on the axis Mlava-Ciechanov; and to ensure that these forces should not be drawn away to the E., they were placed directly under General Headquarters. To fill the place of the IX. Army in S. Poland, Woyrsch's Landwehr Corps was reënforced, and by agreement with Conrad, Böhm Ermolli with the bulk of the Austro-Hungarian II. Army, was brought on rail from the Carpathians to the upper Warta, while to the left of Böhm the "Posen"[2] and "Breslau" corps of Ersatz and Landwehr were brought forward on the Kalisch-Sieradz line. To prepare for the worst, arrangements were made for destroying the mines of Upper Silesia. By all these drastic measures, Ludendorff expected to obtain a partial success that would suffice, without at present calling upon Falkenhayn, to provide the mass of divisions asked for by Conrad. At the moment at which the plan was put into effect, more was scarcely possible. The continuance of the retreat, especially on the front of the Austro-Hungarian I. Army which was taking

[1] Von François resigned his command in indignation and was replaced by von Below.

[2] This was the second reserve of Posen. The first, as Bredow's division, was already on the field.

the weight of the Grand Duke's attack on the line Kielce–R. Opatowka, brought the enemy ever nearer to Cracow and Upper Silesia, and the destruction of bridges and railways on the IX. Army front could only have a temporary effect. Moreover, new dangers threatened both the eastern and the southern fronts of E. Prussia.

On Nov. 5, the Austrian I. Army had retired behind the Nida, Zastrow's advanced forces were retiring on Mlava, Below was preparing to meet a new thrust of the Russian X. Army (Sievers). On the 8th Ludendorff asked Falkenhayn for 6 to 8 more divisions as soon as possible, and for more later. The crisis, and with it the hope of decisive victory, was becoming more acute. On the 10th the regrouping was complete, except in the centre, where Böhm Ermolli was not yet on the scene. Here, cavalry alone held the country to the N. and N.E. of Kalisch. The Posen and Breslau Corps were beginning their advance from Kalisch and Kempen respectively. Woyrsch (Ldw. Corps, 1st Gd. Res. Div., 35 Res. Div.) was in front of Czestochova; from Zarki to Wielun the Austro-Hungarian I. and IV. Armies had fallen back concentrically on Cracow, in front of which they now stood; the XI. Corps covered W. Galicia; the III. Army had taken over the front of Böhm as well as its own and stood on the line Virempna–Dukla Pass–Uszok Pass, and Pflanzer-Baltin, his offensive suspended, was at Vereczc, Okormezo, S. of Delatyn, R. Pruth. But the offensive group (IX. Army under Gen.-Oberst von Mackensen) was ready—the XI. and XVII. Corps astride the Warta where it enters Germany, the XX. at Hohensalza, the I. Res., XXV. Res. and 3rd Gd. Div. between Hohensalza and Thorn.

At that date the Grand Duke's Armies were thus disposed—X. on E. Prussian eastern front, I. (8 divisions) on E. Prussian S. front (Plock to Mlava), with advanced troops approaching Soldau, Rypin and Lipno and one corps S. of the Vistula about Wloclawek; II. (6 divisions and a cavalry mass), W. of Lodz, advancing on Kalisch, with the II. Corps between Kutno and Lencyzka as a protective échelon; V. (8 divisions) nearing the Widawka river, cavalry approaching the Upper Warta; IV. (6 divisions) between the Pilica and Jendnziejow, pointing towards Beuthen; IX. (8 divisions) in the angle of the Nida and the Vistula; III. following up the Austro-Hungarian retreat towards and beyond the Dunajec, VIII. and Dniester Group on the Carpathian front; XI. (newly formed) besieging Przemysl.

On Nov. 11 the advance of the German IX. Army began. On the 12th at Wloclawek, parts of three corps quickly overwhelmed the corps of the Russian I. Army there, and drove it over the Vistula. The next phase was a concentric advance on the Russian II. Corps, right échelon of the II. Army, which held a position from Kutno to Lenczyca; out of this position it was driven with heavy losses on the 15th, losing at Lenczyca the gate between the Bzura and the Ner (Warta) waterlines. Then, while part of the German army pushed forward down the Vistula to intercept any assistance that might come from the I. Army, the XXV. Res. and XX. Corps from Kutno and Lenczyca, with the XVII. and XI. Corps from the Warta valley, advanced on Lodz, the manufacturing centre of Poland.

The battle of Lodz, which began on Nov. 17, is described elsewhere. In its intensity, its vicissitudes and its significance, it was the Ypres of the eastern front. In it took place the epic incident of the break-through, envelopment and final self-rescue of the XXV. Res. Corps and 3rd Guard Division. No battle of the World War shows such varied, involved and difficult tactical situations. Here we are concerned with the results only. From the 19th the Posen Corps and Frommel's cavalry were actively engaged on the left of the XI. Corps, thus connecting the battle of Lodz with the fighting which went on all along the line to Cracow, where the Austro-Hungarian I. and IV. Armies contended without defeat or victory against the thrust of the Russian IV. and IX. Armies. Further E., the Austro-Hungarian XI. Corps and III. Army engaged, equally without decisive results, the Russian III. and VIII. Armies. But Ludendorff had undeniably won his " Teilerfolg," for the Russian onset on all parts of the line S. of the Lodz area was partly or wholly suspended in order to assemble all possible forces for the prevention of disaster on the right wing. Pressure was relaxed also on the two fronts of E. Prussia as the uncommitted reserves of the attack were taken away. In his regrouping the Grand Duke was successful; a continuous line of battle was formed by Dec. 6 from Ilow on the Vistula, W. of Lowicz, E. of Lodz, W. of Petrikow, W. of Novo Radomsk, and so to the Cracow battle-field. But the cost had been heavy, and the Russians were unable, then or thereafter, to resume the tidal advance on Silesia and Moravia. With the formation of this long continuous line from N.W. of Warsaw to S. of Cracow began a new phase of the struggle, in which the battle of Lodz merges into the battle of Lowicz, and that of Cracow develops, on its southern side, into the battle of Limanova-Lapanov.

It has already been mentioned that Ludendorff had on Nov. 8 asked Falkenhayn for 6 to 8 divisions to be sent at once from the W. and more later. At that date Falkenhayn was still contemplating an attempt to revive the battle of Ypres, and had not reconciled himself to position warfare. On the 18th, before the decision had fallen at Lodz, Falkenhayn in agreeing to send 6 divisions had at the same time expressed his belief that it would even so be impossible to bring Russia to admit defeat, and that the outcome—certainly desirable in itself—would only be to relieve Austria-Hungary by the reconquest of the Vistula-San–Dniester line, and perhaps of Lemberg also. But a week later, under the influence of Mackensen's victory, he said that success in N. Poland might decide not only the Galician question but the whole war. He thought this might be achieved by building up yet another striking force E. of the Vistula, where the Russian I. Army was continually giving up divisions for the battle of Lodz. Ludendorff, on the contrary, saw no prospects in such a piecemeal building up of strength which the Russians could answer *pari passu.* Power and surprise combined, he held, were essential. At this moment, there were in Germany 9 new divisions under training, but the awful wastage of the lives and energy of their predecessors at Ypres had convinced Falkenhayn that it was necessary to avoid cutting short their training and to give them more experienced leaders before committing them to battle. Ludendorff, in spite of the achievement of the XXV. Res. Corps at Lodz, seems to have concurred in this view. Thus the reënforcement reduced itself to a gradual incoming of 8 divisions from the W. (II., III. Res., XIII. and XXIV. Res. Corps) which, with the I. from the now relieved E. Prussian front were all absorbed in the frontal battle about Lodz and Lowicz, save one which was sent to assist the Austrian IV. Army S. of Cracow. The battle of Lowicz began and continued as a front-to-front battle in which each side sought to condense enough force for a blow, now here and now there. It ended, in mid-December, with a general withdrawal of the Russian line to a winter-position, which ran along the Bzura and Rawka to Rawa, and thence southward, crossing the Pilica E. of Tomaszew and following the upper course of that river, 5–15 km. E. of it, till near Jendrziejów it reached the Nida, to follow it to the upper Vistula.

South of Cracow, in a country of hills where manœuvre was possible and open flanks frequent, advance and counter-advance alternated during the month of December. In conforming to the general retirement of the Allied forces in October, the Austrian I. and IV. Armies had gathered about Cracow, and during November they had maintained their front against the Russian IX. Army (battle of Cracow). At the end of the month, however, the enemy had developed a strong attack S. of the Vistula, which reached the line Wyclica—Sieprow—Droginia, and threatened by turning the fortress from the S. to make the desired breach for passage into Moravia. This danger was averted by a regrouping of the Austrian IV. Army, which enabled an attack-force to be assembled on the right wing about Mzana Dolina and Dobra, almost in the mountains. On the 3rd this force attacked northward, bringing the Russians' advance at once to a standstill, and forcing them to make new dispositions. The fighting was prolonged and heavy. On Dec. 8, forces of the Russian VIII. Army, condensed on the western flank of that army, be-

gan in turn to attack the flank of the Austrian attack-group, which had gained ground northward as far as Lapanow and Rajbrod. At Limanova, the scene of this flank attack, three dismounted Austrian cavalry divisions had to meet the onslaught of more than an army corps. At the same time, the centre of the Russian III. Army farther N. assumed the offensive again, and threatened at Lapanow, to break the Austrian main body in two. But resistance at Limanova continued till the Austro-Hungarian III. Army, defending the Carpathians with varying fortune, had managed to assemble a group on its left which struck in on the flank of the Russian forces about Limanova (Dec. 11). Thereby the battle of Limanova-Lapanow was decided. A last Russian force which was seeking to reach the flank of this Austrian counter-offensive was itself engaged in flank by other forces of the Austrian III. Army, and the Russians withdrew along the whole W. Galician front to R. Dunajec-Krzostek-Krosno-Lisko (Dec. 14-16). A few days later the Russians launched a fresh offensive which in the battle of Jaslo (Dec. 21-25) drove back the inner flanks of the Austrian III. and IV. Armies to the line Zaklicyn on Dunajec-Gorlice-Uscie-Ruske-Koniecza, and pressed the front of the former back to some places behind the Carpathian line. Here, and farther E., the operations were entering on the phase known as the Battle of the Carpathians, which will be dealt with later. But from Tilsit to Gorlice, the campaign of 1914 closed in "stabilization."

At this period, according to Falkenhayn, the combatant strengths on both sides were: 105,000 Germans and 320,000 Russians E. of the lower Vistula (E. Prussian fronts); 525,000 Germans aud Austrians and 847,000 Russians between the lower and the Upper Vistula; 525,000 Austrians (iucluding 1 German division), and 521,000 Russians between the Upper Vistula and the Rumanian frontier. In sum, 1,155,000 Germans and 1,688,-000 Austrians (of whom 502,000 were German-Austrian).

Acknowledgments are due to General Y. Danilov for certain information as to the Russian plan of campaign and strategic deployment. (C. F. A.)

III. Campaign of January-September, 1915

By the third week of December, 1914, the struggle in the central salient had died down to a trench-warfare contest, in which the remaining energy of the troops was devoted to consolidating gains or to preventing the opponent from doing so. The situation of Ypres was reproduced in that of the eastern front at the end of the battle of Lowicz. But there was the important difference that on both flanks there was still room to manœuvre. On the N. flank, the region of Plock, Mlava and Myszyniec was open, and the Russian army's position, in front of the Angerapp and the lakes, reached for the third time as the result of the battle of Rominten Heath (Nov. 13-16), rested its flanks on no very secure obstacles. On the S. flank, the line was continuous from Cracow to the Carpathians, but thence eastward the position was fluid. The Grand Duke, therefore, determined to assert his offensive will and power, and, confiding in the hardiness of his men, for whom winter was less terrible than for the enemy, began to group his forces with greater density on the flanks. The first signs of this tendency appeared in the counter-stroke of Jaslo, which nullified the reverse of Limanova-Lapanow and initiated the battles of the Carpathians. The second consequence was the reënforcement of the X. Army, and the re-formation, under a new army staff (XII.), of an offensive mass on the Narew.

At the outset, in the latter part of Dec. 1914, this new policy seems to have aimed at tactical results only, but in Jan. the offensives maturing on the outer flanks became evidently strategic. Interpreting the experience of the previous campaigns, the Russian headquarters could see not only the insecurity of their northern corridor, which must continue until E. Prussia had been cleared to the Vistula, and the similar but lesser risk to their left flank, but could also judge that the conquest of E. Prussia and the invasion of Hungary would be very heavy blows to the heart of the war-sentiment in Germany and Austria-Hungary. Reënforcements were constantly coming in, and it seemed that what the Russian headquarters chose to adopt as their plan they could impose upon the enemy. One factor, however, was already causing anxiety, that of munitions. Although the ammunition expenditure on the eastern front was on a much lower scale, both then and thereafter, than that in the W., yet even so it was far greater than had been foreseen; and Russia, with her low industrial development and her difficulties in communication with the outer world, was less well equipped than either her allies or her two opponents to meet the strain. Later, the shortage was to become disastrous and tragic; at present it was an additional argument for transferring operations to those parts of the line where trench warfare had not set in. It was not regarded as a reason for suspending the offensive, but rather for choosing for it those areas where conditions favoured human manœuvring-power.

On the other side, the problem of 1915 was, like those of 1914, viewed differently by the three men concerned, Falkenhayn, Conrad and Ludendorff. The first named, after a moment of enthusiasm in the Lodz period, had returned to his normal method of conducting the war as a war of endurance, with limitations on particular acts of it. One of those limitations in the present instance was the necessity sooner or later of opening a way to Turkey by seizing at least part of Serbia. Another, and the principal, was the necessity of holding firm on the western front. German strategy was now paying the penalty for having doubled its fighting front there by bringing in Belgian territory. Throughout 1915, the year in which Russia was the principal theatre, just as in 1914 when it was only secondary, we find Falkenhayn working with extremely narrow margins of free strength. At a time when Germany alone possessed some 160 to 170 divisions, the adoption or rejection of operative schemes of the highest importance was made to depend on availability or otherwise of four, six or ten of them. Yet there was no remedy for this, short of a considerable surrender of occupied territory in the W.; and in the war of endurance, as conceived by the Falkenhayn school, occupied territory is an asset not to be sacrificed for the sake of a showy, but indecisive, tactical victory. The principle of working from situation to situation was, with Falkenhayn, fundamental, and in the winter of 1914-5 his projects in the east did not go beyond the formation of a German "South Army" under General von Linsingen to aid the Austrians in the Carpathian struggle. In this the motive was direct stiffening and not manœuvre—in fact, only half of this army (4 divisions) was German. To find these divisions, the German chief had to postpone *sine die* his Serbian project, to which he attached very great importance; but the condition of the Austro-Hungarian army in the bitter winter fighting of the Carpathians left him no alternative, especially as the prevention of a Russian break-through into Hungary was a condition precedent of any Danube operation.

Conrad von Hötzendorff, for his part, was sanguine as ever, and the plight of Przemysl—undergoing its second and more terrible siege—continually spurred him to activity. While meeting, with local counter-offensives, the growing Russian pressure on the Carpathian front, he proposed, first an offensive in the centre of the Polish salient on Radom (scarcely a promising direction), and then a resumption of the old scheme of an Austrian and Prussian rendezvous near Siedlce. Neither was accepted by Falkenhayn, and Conrad then proposed the direct relief of Przemysl by means of a great offensive from the Carpathian line. It was for this offensive and this purpose that the German South Army was formed and, later, Böhm Ermolli's II. Army brought back from Poland. Substantially, then, Conrad, unlike Falkenhayn, was eager for battle as such. But, like Falkenhayn, he had no manœuvre—in the true sense of the word—to propose, that was in the given conditions practicable and worth the supreme effort.

At Field-Marshal von Hindenburg's headquarters, on the other hand, the idea of manœuvre was always uppermost. Its basis was the fixed conviction that it was possible not merely to lame but to destroy Russia's fighting power on the field of battle.

To achieve this result against superior numbers, manœuvre was the only way, and by the term "manœuvre" Ludendorff understood the preparation and sudden delivery of a destructive blow by locally superior force upon that part of the enemy's system which was the key of the whole. In the present case, this key position, Ludendorff held, was the Russian X. Army in the foreground of the Masurian lakes. In this quarter, and also between Mlava and Myszyniec, Russian offensives were maturing as early as mid-Jan., and in any case Hindenburg's headquarters had to consider the question of a preventive offensive in E. or W. Prussia or both. But the operative aim became higher as soon as it was known that Conrad meant to attempt the relief of Przemysl by winning through to the San and the Dniester. The four new army corps completing their training in Germany were asked for, for the purpose of a winter offensive which should not only anticipate that of the enemy, but also, in conjunction with Conrad's effort, "decide the whole war." These four corps (XXXVIII.-XLI. Res.) were Falkenhayn's cherished reserve, with which he meant to parry any great crisis that might arise out of the "Winter Battle of Champagne" then in progress, and himself to attempt a decisive offensive in France.[1] From the contemplated blow in Prussia he expected no more than the temporary and local disablement of the enemy, so that he did not think it necessary to coördinate the effort closely in date or direction with Conrad's advance. Nevertheless, "with a heavy heart," as he says, he surrendered the four corps to the east, though at first—till the Champagne crisis cleared in March—he reserved the right to withdraw them again. Actually, the XXI. Active Corps of Alsace-Lorrainers was sent from the French front, the XLI. Res. Corps taking its place there; the other three, with the XXI., went to E. Prussia at the end of Jan. and constituted the new X. Army (General-Oberst von Eichhorn).

The two operations with which the campaign of 1915 began in the W. were not, in the strict sense, coördinated, though their combined effect, owing to geographical conditions, was expected to be the destruction, according to Ludendorff, or the prolonged paralysis according to Falkenhayn, of Russia's offensive power.

The Carpathian Winter Battles.—Owing to the relatively low development of Hungarian lateral railways—the Galician laterals were in the hands of the Russians—it was not feasible for Conrad to form a really important offensive mass in the eastern Carpathians and the Bukovina, as Hindenburg did in the region of the Masurian lakes, without great loss of time. The struggle therefore resolved itself into surgings of frontally-opposed tides, the one seeking to break into the Hungarian plain, the other to rescue Przemysl. Although, the lines being for the most part discontinuous, tactical and local outflanking efforts, for the time and place decisive, were constantly made by both sides, there was no systematic attempt at strategic envelopment on either. At one moment indeed (Feb. 20), Pflanzer-Baltin's army group, victorious in Bukovina, sought to wheel in on the rear of the battle-field of the German South Army; and at a later stage the Russian Dniester forces were heavily reënforced for the purpose of driving Pflanzer-Baltin away and so gaining the flank of Linsingen. But in the main the opposed tides affronted each other and were broken, each in turn. In W. Galicia, the Russian offensive of Jaslo came to a standstill in the first days of January, and for the next three months nothing of importance took place W. of Gorlice. Here the Russian III. Army (Radko Dimitriev) and the Austro-Hungarian IV. Army (Archduke Josef Ferdinand) were opposed. In the middle Carpathians, where Brussilov's VIII. Army was opposed by Boroević's III. Army and by the left wing of the widespread Pflanzer-Baltin group, the year opened with the evacuation by the defenders of the important Uszok Pass, under a local threat of envelopment. The Dukla Pass and the adjacent mountain region had already been lost, and from the Uszok the withdrawal spread east to the Volocz and Wyszkov Passes. In the eastern Carpathians and Bukovina the Russian Dniester group (Webel) pushed back the light forces which Pflanzer-Baltin had in the foreground of the mountains, but in the last week of Jan. the arrival of the Austrian XIII. Corps from Serbia gave Pflanzer-Baltin enough forces to enable him on the 31st to begin the reconquest of the lost ground. Meanwhile, the right of Boroević's III. Army had held on, in spite of the loss of the Uszok and the Dukla Passes, and it was now reënforced. After covering the assembly of the German South Army about Munkacs, this wing was to constitute the striking force of Conrad's offensive for the relief of Przemysl, the South Army (including Hofmann's Austrian Corps facing the Volocz Pass) following it in échelon on the right.

The offensive began on Jan. 23, and as usual in this part of the eastern theatre, met at first only light forces of the Russians. The whole Austrian line, from E. of the Dukla to the Wyszkow Pass, moved forward, the left wing of Pflanzer-Baltin conforming. The Uszok, Volocz and Wyszkow passes were retaken by the South Army, and Boroević's striking force reached and passed the upper San (line Czeremcza-Baligrod-Lutowiska-Borynia-Smorze) by Jan. 31. But the Russians had already answered by accelerating their projected offensive against the centre and left of Boroević (front Mezölaborcz-Konieczna) and especially southward and south-westward from the Dukla. From this point the battle was a contest of will-power and manpower. The inactive fronts were stripped of more and more divisions. Early in Feb. Böhm Ermolli's headquarters returned from Poland to their old place on the right of the III. Army (front Lupkow Pass-Uszok Pass), and on the other side Letchitsky's IX. Army headquarters were withdrawn from the Nida for the Dniester theatre. Between the end of January and the end of April the strength of the opposed forces in Poland west of the Vistula were approximately halved. In the event the Grand Duke Nicholas not only succeeded, during the first three weeks of Feb., in checking (and in forcing back somewhat) the Austrians on the Upper San, but considerably enlarged his gains S. and S.W. of the Dukla Pass, taking Mezölaborcz and the Lupkow Pass, and penetrating the Laborcz and Ondava valleys. On the other hand the German South Army made its way forward, very slowly, astride the Munkacs-Stryi railway.

Further E., the counter-offensive campaign of Pflanzer-Baltin, begun on Jan. 31, was successful in clearing all Bukovina and the Carpathian foreground as far as the Pruth on the right and the Dniester in the centre, but its left, attempting to intervene in the rear of Linsingen's opponents, was involved in heavy fighting about Krasna on the Lomnica, and in the last week of Feb. the heavy counter-attacks of the assembling Russian IX. Army drove the centre from its forward position on the Dniester. By mid-March, Pflanzer-Baltin had been forced back still farther to a line marked by the upper Lomnica-Solotvina (on the Bistrica)-Czernelica-Horodenka-Snyatin-Czernowitz, on which operations came to a standstill. These operations were however of secondary importance in which only some 10% of the whole forces of each side were concerned.

The real crisis, which culminated in March, was on the front between the upper San and the head of the Ondava valley, N.E. of Bartfeld (Bartfa). As in Feb., the right of the Austrians sought to force a way to Przemysl—now in extremity—and the right of the Russians to enlarge the bridge-head in front of the Dukla and Lupkow Passes. The fighting was again intense, for the Austro-Hungarian II. Army had been reënforced for a last effort; but in the main its advance on Przemysl was definitely stayed by the middle of the month, while the Russians in the Dukla region made continuous, if slow, progress. The German South Army progressed along the railway to Tuchla, but at this stage of the battle its advance had not and could not have any great result, and its left was held up for weeks before the strong positions known as Zwinin and Ostry, covering Koziowa. Finally, on March 20, sure of the imminent surrender of Przemysl (which in fact fell on the 23rd) the Russians launched all along the front of the Austrian III. Army new attacks which, fed by troops released from the blockade of Przemysl, drove that

[1] The German contingent of the South Army had been formed from local reserves already in the east. Its staff was formed from that of the II. Corps.

army back to the line S. of Zboro-Kurima-Strzopko-S. of Virava-Wola Michowa. At the same time Böhm's forces on the upper San front were compelled to fall back to the starting line of Jan. 23, whence they were withdrawn, in a state of exhaustion, to a line generally behind the mountain crest. The right, still in front of the recaptured Uszok Pass, was transferred to the control of the South Army.

Three weeks longer the battle lasted, but without material change, though both sides were 110,000 to 120,000 stronger in combatants than they had been in January. In the area of the Austrian III. Army two fresh German divisions, grouped as the "Beskiden Corps," arrived to stiffen the defence. In its new positions the Austrian II. Army held its own. The South Army maintained its ground also from N. of the Uszok Pass to Tuchla, and stormed at last the positions of the Zwinin (April 9) and Ostry (April 25) and Koziowa. To the E., Pflanzer-Baltin's right wing and centre, reënforced by German mounted troops, regained its positions on the Dniester and held off a new attack which Lechitzky mounted against its outer flank between Czernowitz and Usciehiskupice on the Dniester. By April 20, however, the Battle of the Carpathians was at an end, after three months of continuous mountain fighting, in temperatures sometimes as low as −22 deg. F.

The apparent effect of these battles was to give the Russians more secure possession of a bridge-head S. and S.W. of the Dukla Pass which they could not use, and to waste the remaining war-energy of the Austro-Hungarian army in attempting to relieve a fortress which certainly contained fewer men than the number sacrificed in the attempt. But in reality the indirect consequences of the battle were of much greater importance than the direct. In the Carpathians, no less than in the Masurian winter battle presently to be described, the Central Powers had managed to snatch the initiative before the Russian offensives had got under way, and thus put back the date and place of those offensives so far that the break-through into Hungary proved impossible. For the third time the "steam roller" had been brought to a standstill. Moreover it was showing signs of wear. Man-power had been unsparingly expended by the Russian command in its determination to break through; the trained officers and under-officers of peace-time were reduced to a skeleton, and the supply of munitions and even arms was becoming a very grave problem. In the majority of cases, it had been the Russians who attacked and the Austrians who defended the strong mountain and hill positions, and, though specific figures are not known, all the evidence available points to the Russian losses having been far greater than those of the Austrians and Germans. In sum, the Russians needed a pause even more than their opponents.

The Masurian Winter Battle and the First Battle of Praasnysz.—The plan of campaign formed by Ludendorff for E. Prussia, as already mentioned, aimed higher than the simple preventive-offensive for which Falkenhayn had "lent" the four new army corps. His line of reasoning, differing from Falkenhayn's, was, and remained, this:—the war will be decided by military victory in the W.; but this victory will not be possible till after the definitive defeat of Russia, because the degree of numerical and material superiority required for the double task of breaking through the strong trench-system of the W. and exploiting the break-through in an open-field campaign was not attainable till Germany could devote practically every battle-worthy man and gun she possessed to the western theatre. Meantime, nothing was gained and much lost by using up reserves in repetitions of the battle of Ypres. Whether, in Feb. 1915, the time was ripe for such a blow as Ludendorff contemplated is however more doubtful. Both on the Mlava-Myszyniec front and on the E. front of E. Prussia the Russians were well in advance of the natural barriers protecting the northern corridor. Victory W. and N. of those barriers could only lead to a limited exploitation unless the barriers could themselves be carried in the tactical pursuit. Victory on the barriers themselves, on the contrary, would give an unlimited field for strategic exploitation inside them. In the situation of Feb. 1915, then, an effort to inflict a completely disastrous defeat on the Russians required two successive efforts, or successive maxima in a continued effort; hence a double allotment of force would have to be made. A large part of the required divisions could have been found from the army reserves of the central salient, or by thinning the line itself there, had it not been for the formation of the German "South Army," which, raising the number of divisions absorbed in the Austro-Hungarian front from 1 to 5, left only limited possibilities of drawing on the IX. Army and Woyrsch, for the benefit of the E. Prussian Army, which ever since Nov. had been on a very low footing. Woyrsch and Mackensen were in fact able to provide six free divisions. For the rest, if nothing could be spared from France, the eight new divisions were the only available reënforcement. Hence Falkenhayn's well-founded scepticism as to the scope of the E. Prussian offensive, and hence also Ludendorff's regret, after the event, at having parted with so much of his local reserves for the bolstering-up of a Carpathian attack.

The secret augmentation of the E. Prussian forces from the figure of 10 divisions (8 of which were Landwehr and Ersatz) in mid-Jan. to that of 24 in the first week of Feb. was itself no small task, and had it not been for a very fierce diversionary attack by the IX. Army at Bolimow, in the angle of Bzura and Rawka, on Jan. 31-Feb. 2—memorable as the first occasion on which gas-shell were employed on a large scale—it is doubtful whether it would have been accomplished, for the assembly had to be made under cover of a thin screen of mounted troops, and by hypothesis the opponent himself was preparing to attack. The plan itself was comprehensive, and suggests that Ludendorff had not given up hope of being able to extract more divisions from Falkenhayn. It consisted in three main elements:—(1) the destruction, by means of breaking through and envelopment combined, of all enemy forces lying between Lyck and Tilsit, (2) the attempt to carry the Bobr line with a rush so as to break into the "corridor" south of Grodno, and (3) an advance on the Mlava-Willenberg front, in conjunction with (2), so as to bind the Russian I. Army while the X. was being destroyed and the Bobr forced.

The German forces were divided into three armies:—the VIII. (Otto v. Below) of 7 divisions (including one of the new corps), which, after covering the whole eastern front during the assembly was to form an attack front on its right wing (Johannisburg); the X. (v. Eichhorn) of 7½ divisions, including the XXI. active and the other two new Reserve Corps assembled between the Niemen and the Lakes; and the Army Group Gallwitz, ten divisions, of which six came from central Poland, holding the southern front from the Orzyc to the lower Vistula.

The scheme of the German offensive, though it was to be carried out over much the same ground as the September battle, differed considerably from the plan of that battle. The winter trench-line represented the halt of the Russians after the Rominten Heath battle, in front of the Lakes-Angerapp barrier. It ran N. to S. from the Schorellen Forest by Darkehnen, E. of Lötzen to W. of Johannisburg, where it began to curve away to join the southern front. The right wing therefore presented to the Germans better chances of envelopment than Rennenkampf's right had shown in Sept., and it was on this flank that Ludendorff meant to make the chief effort. But the most significant difference was that it was now intended to treat the attack on the Russian S. flank as a break-through and not an envelopment problem. For this reason, not only was an attack-group formed behind Lake Spirding but von Gallwitz, guarding the S. front, was to occupy the Russians on the Narew and prevent them from assembling large forces against the S. side of the VIII. Army attack. Moreover the attack was to aim at seizing crossings of the Bobr at and near Osowiec. Tactical coöperation in the encirclement of the Russian forces north of Lyck was the primary but by no means the principal task of the VIII. Army's attack-group. If the power and speed of the X. Army's blow from the N. proved as great as was hoped, the exact position of the anvil on which it crushed the Russians was of secondary importance compared with the seizure of Osowiec and the Bobr by brusque attack in the Liége manner. On this, and on the progress made by the XX. Corps (Gallwitz's left) by Myszyniec on

Lomzha, would depend the strategic, as against the tactical results of the whole enterprise.

The "Winter Battle of Masuria" therefore may be regarded, if not as the first great battle of the latter-day type, at any rate as in a transitional style. Although an open flank existed and was utilized to produce the tactical envelopment or "Cannae" of pre-war theory, yet the effective victory was intended to be gained from a break-through, tactically difficult, but aimed in a strategically favourable direction.

The attack of the VIII. Army began on Feb. 7; that of the X. Army on Feb. 8, in the midst of snowstorms which, during the battle, changed to rain—the worst conditions for the carrying out of the scheme and notably its strategical part, which depended on the marshes of the Bobr being frozen hard. In sum, the X. Army drove the Russians southward without intermission from the first day. By the 10th the northern portion of the Russian line was being taken down with all speed, and by the 12th the German X. Army stood on a line from Ludwinow to Rominten Heath at right angles to the VIII. Flank guards were put out toward Pilwiszki and Mariampol against intervention from Kovno, but neither then nor later did anything more serious than threats by light forces develop on that side. Meantime, however, the VIII. Army's attack (XL. Res. Corps and parts of the I. Corps) from Johannisburg Heath and Lötzen on Lyck was brought to a standstill in front of Lyck by the fierce resistance of the III. Siberian Corps, which not only suspended the advance eastward, but led the German forces that were to the S. of it to swing north-eastward on Rajgrod so as to envelop the Lyck position. The expected Russian counter-attacks from Lomzha and Osowiec proved too feeble—being absorbed chiefly by the advance of a division of the XX. Corps farther W.—to interfere seriously with this tactical manœuvre. But thenceforward the Osowiec portion of Ludendorff's scheme was doomed. The battle became the purely tactical "Cannae." As such, it was brilliantly successful. By Feb. 14 Lyck had fallen and the VIII. and X. Armies had made good a semicircular position from Rajgrod, by Raczki and Seyny to the N.E. corner of Augustow forest. In the forest the Russians (no longer able, for want of routes, to withdraw with speed) fought with desperation to gain time for orderly withdrawal to Grodno, the one remaining avenue of escape. But by the 18th, forces of the XL. Res. Corps from Rajgrod reached the Bobr about Krasnybor, and, on the other wing, part of the XXI. Corps from E. of Seyny drove down at all risks, parallel with the Niemen and within range of the guns of Grodno, to Lipsk, thus closing the ring round four Russian divisions left in the forest. In this extraordinary situation, the German X. Army slowly completed the destruction of the encircled Russians, who resisted for several days and made fierce efforts to break the ring, while small German forces, fighting back to back with the encircling troops, held off relief attacks from Grodno and the Bobr. Finally—but some days too late for the realization of Ludendorff's plan—the remnant of the four divisions in the forest surrendered. In all, this astonishing victory gave the Germans 110,000 prisoners, over 300 guns, and a vast quantity of stores which the Russians could ill spare.

Even before the end, Ludendorff had attempted to extricate enough forces from the W. and N.W. portions of the ring to form the attack on Osowiec and the Bobr. He reconstituted the management of the mixed-up armies as best he could by putting all forces W. of Augustowo under Below (including the XX. Corps) and all engaged in and N. of the forest of Augustowo under Eichhorn. But most of the troops destined for this were involved in the forest battle, and the Osowiec groups had to be made up chiefly out of the troops that had been crowded out of the line as the wings converged. Of the XX. Corps only one division was available, and this had advanced no farther S.E. than Stawiski and Lipniki since it moved from its concentration area three weeks before. The other division was engaged on the Omulew river, and was connected to Lipniki by a thin screen of Landsturm. In sum, it was impossible with exhausted and scattered troops to force the now sodden marsh-valley of the Bobr or to reduce Osowiec. Hindenburg therefore ordered the attacks to be discontinued.

Moreover, the position of the X. Army, far ahead of regular supplies, had become untenable, and as soon as the battlefield had been cleared it began to withdraw, just in time to secure good conditions for meeting a Russian counter-offensive from Grodno and Olita. There the Grand Duke, "by stamping his foot on the ground"—as it seemed to his opponents—had called into being a new X. Army.

This counter-offensive penetrated through the Augustowo forest, almost to Augustowo, and, to the N. of the forest zone, it reached and passed Seyny and Simno (March 5–7). But, thinking that at Simno it had found the flank of the German defence—*i.e.* miscalculating the promptness of the German decision to regroup on a rear line—the Simno force swung in to the S.E. toward Lozdzieje (March 8), exposed its own outer flank to counter-attack from Eichhorn's left, which stood between Simno and Kalwarja, and on March 9 fell upon the flank and rear of the Russians, at the same time as the frontal defence in and north of the forest turned to counter-attack. The Russians thereupon withdrew behind the Niemen again. The German X. Army now returned to its prepared line Augustowo–Krasnopol–Kalwarja–Mariampol–Pilwiszki–Szaki.

But the real crisis of the second half of Feb., which lasted till mid-March, lay not on the Niemen, but on the front of the new German VIII. Army and more particularly on that of Gallwitz. Here with his XII. Army (Plehve) the Grand Duke had all along intended to make the main effort of his Russian offensive, as geographically dictated; and the advances of Gallwitz and of the German XX. Corps, as diversions and flankguards for the Masurian battle, had merely put back the Russian preparations in time and place. Anger at the disaster to the X. Army, and fears for the safety of the "corridor" at its sensitive point N.E. of Osowiec, caused the Grand Duke to divert forces from the XII. Army to form the new X., but without affecting the mission of that army, which accordingly took the offensive against Gallwitz about the same time as the struggle in Augustowo forest came to an end. At the same date the attempts of the German VIII. Army against Osowiec and the Bobr line were dying out, and the division of the XX. Corps north of Lomzha was pinned by heavy counter-attacks from that place, while the other division of that corps was making head on the Omulew against similar efforts from Ostrolenka, and the Landsturm screen between them was holding its ground with difficulty against other attacks from Novograd. The crisis, from the German point of view, was so grave that even in Ludendorff's memoirs, written four years after the event, satisfaction in the "Cannae" of Augustowo is almost completely smothered in the remembrance of anxieties, makeshift reënforcements, and critical decisions concerning the S. front. All energy on both sides was now focussed on this front.

In the winter of 1914–5, light forces of the Germans had been advanced, originally as an element of the battle of Lodz, a considerable distance S. of Strassburg and Mlava, and the reënforcement of these troops to the strength of an army group had taken place on this forward line. Gallwitz had then advanced, in conjunction with the Masurian offensive, deep into the concentration zone of the Russian XII. Army (Feb. 13). In a few days he had reached the line Plock–Racionz–Przasnysz. But by about the 24th, Plehve's interrupted concentration was sufficiently near completion for him to advance. Pressing the front of Gallwitz on each main route, he developed his greatest strength in the Orzyc and Omulew valleys. In the latter, the division of the German XX. Corps above mentioned engaged the Russian advance in a series of combats which in the event were undecisive; but in the Orzyc region the Russian blow upon Przasnysz succeeded in driving back three divisions under v. Morgen (I. Res. Corps) with very heavy losses (Feb. 25–27). The whole centre and left of the German line then fell back, pursued by the Russians, to the line Radzonovo–Mlava–Chorzele. On and about this line fighting remained severe till about March 19, kept alive on the German side by successive reënforce-

ments from the X. Army, and by assumption of responsibility for the Omulew front by the VIII. Army, which enabled Gallwitz to group his forces more closely on the Chorzele and Mlava fronts.

The crisis died away in local attacks in the latter half of March. The Russians were becoming weak in munitions; the Germans continued weak in men. The last fluctuations of the battle brought the Germans from Chorzele close up to Przasnysz.

Thus the E. Prussian offensive of the Russians closed, in the same way as the Carpathian offensive was soon to close, with little gain and great loss of leaders and of irreplaceable ammunition. The Germans, on the other hand, like the Austrians, had failed to achieve their *strategic purpose*. The general results were thus, for both sides, *negative*, in spite of the accomplished "Cannae" in Masuria—itself an exhausting effort.

Intentions and Plans for the Summer Campaign.—On both Prussian and Galician fronts a pause of some weeks was imposed by the weariness of both sides. The latter part of March and early April in the N., and the last half of April in the S. were devoted to discussion and formation of plans. At this stage the distribution of force was, according to an Austrian headquarters statement of April 20, as follows, in rifles and carbines:—

East Prussian fronts: 263,000 Germans of X., VIII., and Gallwitz Armies, and 508,000 Russians of the X. and XII. Armies. Frontage 380 km.

Central salient: 245,000 Germans and Austrians of IX., Woyrsch, and Austro-Hungarian I. Armies, and 436,000 Russians of the II., I., V., and IV. Armies. Frontage 275 km.

Upper Vistula to Beskidengebirge: 108,000 Austrians (IV. Army) and 100,000 Russians (III. Army). Frontage 110 km.

Carpathians and Bukovina: 385,000 Austrians and Germans (III., II., S. Army, Pflanzer-Baltin) and 496,000 Russians (VIII., XI., and IX. Armies). Frontage 387 km.

In sum, there were 1,001,000 Germans and Austrians to 1,540,000 Russians.

According to the distribution table given by Falkenhayn for the end of that month, 366,000 German combatants faced 640,000 Russians between the Baltic and the Vistula; 184,000 Germans and 54,000 Austrians, in all 238,000, were opposed to 407,000 Russians in the Polish salient; and 89,000 Germans and 610,000 Austrians, total 699,000, stood on the W. Galicia, Carpathian and Bukovina fronts against 720,000 Russians. In sum, 1,303,000 soldiers of the Central Powers to 1,767,000 Russians. The difference between the two sets of figures is partly accounted for by the fact that artillery personnel is included in the second and not in the first set: but whether taken separately or together, the figures throw a strong light on the state of the Russian army on the verge of the tremendous campaign of summer, 1915. It will be noticed that the total of 1,767,000 combatants is approximately the same as the mean monthly strength with the colours in peace (1,700,000). At this period no considerable forces were maintained in any but the eastern European theatre, so that, in effect, practically the whole of Russia's resources in men had been absorbed in maintaining the formations existing in peace and some 35 reserve divisions created on mobilization.

It will be noticed also that under the imperative needs created by the two-front war the German forces in the East had trebled, as compared with the strength at the time of the Masurian lakes battle in Sept., but that the Austro-Hungarian forces, though far above the nominal figure of Sept. 1914, were well below their mobilization figure. Hitherto, it must be remembered, the policy of "winning the war in the East" had not been accepted by Falkenhayn, and the German increases represented simply defensive and counter-attack requirements, and in particular the relief of pressure on the Austro-Hungarian armies. Correspondingly, German ideas and execution began from this date to predominate over Austrian. But no effective united command was ever created. German interferences in Austrian operations and operative methods, imperatively necessary to the common cause, but very often tactless, were constantly resented by Conrad and by most Austrian leaders; and moreover great divergencies of policy developed between the two imperial Governments in respect of Poland, Italy, and the Balkans.

Falkenhayn neither then nor thereafter accepted the principle that a decision could be obtained in the East. But his ideas had undergone a change since he conceded the eight new divisions to the eastern theatre "on loan." The French attempt to break through the Champagne lines had failed. A large number of German divisions were being reorganized on the basis of three infantry regiments instead of four, and the forces thus obtained were grouped in new handy divisions of veteran troops, which gave greater freedom in the play of reserves. He had abandoned, after detailed study, his Jan. prospect of a break-through on the Albert-Arras front, and therewith all offensive plans in the western theatre, while Conrad had refused to agree to his renewed proposal to force a way through Serbia for munitions for Turkey, though the peril of a Dardanelles break-through was becoming more and more evident. On the other hand, indices collected both on the Carpathian and Prussian fronts pointed to a growing shortage of material on the Russian side, as well as to a decrease of efficiency owing to losses in leaders and pre-war soldiers. Falkenhayn further thought it possible to keep both Italy and Rumania neutral, at least for a long time. All things considered, he came to regard a very heavy blow on the Russian front as necessary, possible, and desirable; and on Conrad's reviving, on April 7, the old scheme of combining blows from the lower San, and from the S. front of E. Prussia, with a rendezvous near Siedlce, he agreed, not indeed as to the plan, but as to the principle. It was still only a "sufficiently" heavy blow that he intended to deliver, but the limitation implied in the adverb was considerably relaxed. Eight divisions (Guard and X. Corps, XLI. Res. Corps, and two of the new divisions) were to be brought over from the western front, this time simultaneously and for use as an army. Of this army (XI.) Mackensen was appointed chief, with Colonel v. Seeckt as his chief of staff, Prince Leopold of Bavaria succeeding Mackensen at the head of the IX. Army. To cover the withdrawal from the W., sharp local actions were initiated at different points on the trench-line. One of these, involving ten or more divisions, is known to history as the Second Battle or "gas attack" of Ypres.

The theatre of Mackensen's operations was to be the country between the upper Vistula and the mountains (Dunajec–Gorlice–Tarnow), where the front of contact was in much the same position as it had been at the end of the battle of Jaslo. It was held by the Russian *III. Army (Radko Dimitriev)* on the one side and by the Austro-Hungarian *IV. Army (Joseph Ferdinand)* on the other, both being relatively weak. Supposing surprise to be effected, a mass of eight first-class divisions, supported by the troops already on the front and by artillery on a scale never before seen in the East, had every prospect of breaking through. Falkenhayn took many precautions to secure his surprise, and in the main with success, although the Russians and their Allies were well aware that a blow was impending at some point of the eastern front. The troop trains were sent by roundabout routes, false rumours were circulated, and Conrad himself was not informed of Falkenhayn's decision till the movements of concentration had begun. Hindenburg, whose jurisdiction only extended to the left of Woyrsch's line, was instructed to make demonstrative attacks at different points. One of these, the raid of v. Lauenstein's group into Courland, had an important sequel, and will be discussed later. The significance of the other two, an attack at Suwalki by the X. Army and a gas attack near Skierniewice by the IX. Army, was only momentary. In direction the attack was partly frontal, and it has been criticized for that reason. But a prime factor was the necessity of relieving the situation for the Austrians on the Carpathian front as soon as possible; and, besides in all probability compelling the Russians to retire in the southern part of the central salient, a drive N.E. and E. from the front Gorlice–Tarnow would make the Russian positions in the Carpathians untenable at least as far as the Lupkow pass inclusive. Falkenhayn went further, and proposed to involve the Russians even more thoroughly in mountain difficulties by retiring the right of the III., and the II. and South Armies. To this, however, Conrad would not agree; and Mackensen's blow lost part of its effect through this refusal.

The Dunajec–San Operation.—Reënforced by the Austrian VI. Corps already on the front, and placed in general charge of the Austrian IV. Army as well as of his own, Mackensen was himself subordinated to Conrad's headquarters, though in fact no major decision could be taken without Falkenhayn's agreement. On the Nida front the Austrian I. Army, and in the Beskidengebirge the Austrian III. Army, stood on the flanks of the two attack armies, and in case of success would be carried along as supports. On May 1 (see DUNAJEC-SAN, BATTLES OF) Mackensen's artillery preparation began. The scale of artillery and trench-mortar strength—hardly higher than that of a quiet sector in France in 1918—was, for the East and for 1915, overwhelming. At night, as a final diversion, an Austrian division crossed the Dunajec a little above its mouth and established two bridge-heads. On May 2 Mackensen's attack was launched between Woynicz on the Dunajec and Malastov (S.-S.E. of Gorlice). The troops of Radko Dimitriev gave ground, fighting stubbornly. By the 6th they had retired with heavy losses beyond the Wisloka; and the Austrian III. Army, taking up the attack in échelon rightward, had regained the Dukla Pass. By the 9th Mackensen had forced the Wisloka, Boroević was at the evacuated Lupkow Pass, and even Linsingen's left was advancing. On the 11th, on the other flank, the Russian IV. Army evacuated the Nida position, pivoting on Kielce. Operations were fluid, and it was Falkenhayn's and Conrad's problem to maintain them so.

Falkenhayn's intention was to ensure this by making the operation continue as a tactical one, with as little regrouping as possible outside the limits of the battle that was in being. For this reason he rejected a proposal of Conrad to reënforce, at Mackensen's expense, the Pflanzer-Baltin group (now called VII. Army), which by reason of its position might be enabled thereby to reach the rear of the Russian southern wing. He ignored the relief offensives started by his opponent against the front of Pflanzer-Baltin and elsewhere, and he even sought to utilize the attack upon Pflanzer-Baltin as a means of setting in motion the German South Army and the still stable portion of the Carpathian front, E. of the Lupkow Pass. But at first he had no intention that the effort should go in the slightest beyond its tactical limit, which he fixed as the San–Dniester barrier. Conrad agreed. Both leaders were anxious to disengage large forces for use against Serbia or Italy or both.

As foreseen, the rush of the Gorlice offensive came to a stand on the San–Wisznia line. The Grand Duke had, under cover of his relief offensives, collected adequate forces on the III. Army front and was prepared to hold it firmly. By the 14th Mackensen had taken a total of 140,000 prisoners and more than 100 guns, and had reached the line Tarnobrzeg on Vistula (link with Opatowka line)-Nisko on San–Sieniawa (Austrian IV. Army); Sieniawa–Jaroslaw–Radymno (XI. Army); Magiera and Chyrow region (III. Army); Stary-Samhor (II. Army). But along the lower San, in the bridge-heads of Jaroslaw and Radymno and the fortress of Przemysl, the Russians were ready to fight again, on the alert, in prepared positions, and had by demolitions of all sorts made the supply problem difficult for the Germans and Austrians. At that date Brussilov's VIII. Army and Shtcherbachev's XI. on its left were intact; Szurmay's and the left of Linsingen's were only beginning to advance; while Pflanzer-Baltin was on the defensive along the Pruth except at Kolomea where he still held a bridge-head. Moreover, Italy was on the point of declaring war (as she did on the 24th) and Rumania's intentions were impenetrable. On the western front, the French and British had opened their relief offensives of May 9 (battles of Carency and Festubert). The Dardanelles was under military as well as naval attack, and the Turkish and Balkan problems, always obscure, had thereby become acute as well.

Nevertheless, during the fourth week of May, Falkenhayn finally determined to carry on the Galician offensive and even to extend it. It appeared, from Mackensen's reports, that the shortage of munitions on the Russian side, already observed here and there, was general, and that it was possible in consequence to keep the offensive alive till it had secured a decision "sufficient for our purposes," in Falkenhayn's own words. Fresh troops were drawn from the West—in spite of the crisis north of Arras. Hindenburg was invited to press the advance of Woyrsch's army group—which had already begun on the 12th to move forward on the left of the Austrian I. Army and was in front of Radom by the 16th—up to the Vistula below the San confluence. As in the Vistula–San operation of October 1914, the threat of turning the San line by Josefow was thought to be an effective means of weakening it against frontal attack. Ludendorff, however, declared this operation to be impossible, in spite of the offer of fresh divisions—his mind was already set upon a more grandiose scheme. Falkenhayn thereupon gave the incoming divisions (2½ from France and 2 from Poland) to Mackensen, and on June 3 that general received instructions to push the XI. and IV. Armies over the San barrier, south of the Tanev, in coöperation with an eastern advance of the Austrian II. Army (now comprising what was left of the III. after Boroević's departure for Italy), which should "finally" beat the enemy still remaining south of the Dniester in front of the South and VII. Armies. Hindenburg was merely "to take any chance that offered itself anywhere of profiting by the enemy's shortage of munitions." In sum, then, the scheme was simply a prolongation eastward of the Gorlice–Tarnow effort by means of a fresh engagement of reserves. No new operative idea was involved. But the decision to continue the battle was in itself an operative decision of the first importance, and, in view of the general war situation, a very bold one.

Mackensen meanwhile, partly urged by his own fighting spirit, partly compelled by Russian counter-attacks, had been involved in constant fighting on and for the San line. The Austrian IV. Army was strained to the utmost in holding on to the positions it had gained on the middle San (below Sieniawa) and in front of the link Nisko–Tarnobrzeg (or "San angle position") which joined Radko Dimitriev's front to that of Evert on the Opatowka. The right of the XI. Army was similarly held up by the Russian positions about the Radymno bridge-head, and Przemysl interposed a formidable obstacle between that army and the advancing Puhallo group (the relic of the Austrian III. Army, which included also the German Beskidenkorps). But the left of the XI. Army stormed the Jaroslaw bridge-head and, crossing into the Lubaczowka valley, pressed the right rear at the Radymno bridge-head farther up the San. On May 24 a general assault carried this line, and the Russian centre, its right still holding the "San angle" position and the San below Sieniawa, fell back to the line of the Wisznia, the Grodek lakes, and the Wereszyca. Practically at the same time, the right of the XI. Army, Puhallo, and the left of the II. Army closed upon Przemysl from the N., W., and S.; after severe fighting the fortress fell on June 3, as described under PRZEMYSL. Farther E., the right of Böhm-Ermolli's and the South Army, advancing in the last ten days of May, reached the line Weliko Bloto ("great marsh") on the Dniester–E. of Drohobycz–S. of Stryj–Dolina, making connexion at Jasien with the left of the VII. Army, which was holding, still with success, the Pruth line.

The Russians, however, failing as were their resources, reacted powerfully. The Grand Duke's instructions were that "for political reasons, it is imperative to hold" the Opatowka–San–Grodek line "at all costs," and he carried them out by a series of heavy counter-strokes. First on the lower San against the Austrian IV. Army, then on the Pruth against Pflanzer Baltin, and lastly against Linsingen on the Stryj front, offensives on a large scale were delivered in the latter half of May and the first week of June. New masses were drawn from an army at Odessa which was to have coöperated in the attack on Constantinople. Even Woyrsch's advance, far away on the Kielce–Radom railway, was opposed by stubborn defence and sharp local counter-attacks. But in the last resort the Grand Duke's forces were inadequate for prolonged defence. The long exposed flank of the northern corridor compelled him to keep fairly large forces inactive on the Narew, the Bobr, and the Niemen; and the Lauenstein operation in Courland (described below) made a continual drain on his northern resources. But above

all, the failure of munitions led to enormous losses, both in counter-attacks and in rearguard operations. By June 16 the Russians had lost, in the battles of Gorlice-Tarnow, the San, Stryj and the Pruth, no less than 392,000 in prisoners alone, besides 304 guns. The last acts of this phase were the forcing of the Grodek lines by Mackensen's two armies on June 16–19 (*see* LEMBERG, BATTLES ROUND, Section II.) and the successful two-fronted battles of Linsingen's South Army about Stryj and Drohobycz, in which his left, facing north, held off the counter-attacks of the Russian XI. Army, while his right, by intervening in the flank of Pflanzer-Baltin's opponents (IX. Army, Letchitsky), made them retreat to the Dniester (May 31–June 15).

The Bug and the Narew Campaigns.—Although the Russian retirement in E. Galicia was not, as Conrad imagined for a moment after the fall of Lemberg on June 22, a retreat in dissolution, it was definitively a retreat on the largest scale. Once the gap between the San and Dniester had been forced, neither was tenable by the defence. Very soon, therefore, the Russians on the Dniester were taking down their line from right to left, to re-form on the positions offered by one or another of the N.-S. tributaries of that river. From the San, the Tanev and the region of Rawa Ruska, the retreat took a northerly direction and thus there came up again the same possibilities, risks and alternatives for the Austrian offensive as those of Aug. and early Sept. 1914. The conditions were, however, partly changed. The Russians and Austrians alike had lost most of their peace-trained leaders and their offensive energy. Instead of the general clash of an encounter battle, it was now a case of retreat and of a follow-up, upon which delay was imposed by the necessity of restoring demolished communications, and caution by the risk of counter-attack striking the pursuit at a weak spot as it opened out fan-wise towards Lublin-Chelm and towards Sokal. Such a counter-attack did in fact bring the German XI. Army into momentary peril between July 7 and July 12.

The prospect of a slow advance of indefinite depth made it imperative for Falkenhayn and Conrad, and especially for the former, to reconsider the position. Hitherto the German leader had proceeded from one limited objective to another, all along the same general direction. Now—at the beginning of July—the choice had to be made between initiating a far larger operation and calling a halt to consolidate gains.

There were in reality two decisions to be made, one of principle and one of method. On the principle of continuing the offensive against Russia, Falkenhayn's opinion was, fundamentally, unchanged, and he foresaw new dangers in France owing to the impending appearance there of 12 British new army divisions, considered as heralding an attack. But deciding, on the evidence, that the great French offensive would not take place till Sept., and relieved of fears for the Italian front—impressed also, without doubt, by the repeated counter-strokes of the Russians—he decided on June 28 to initiate a new eastern offensive effort.

The second decision, as to the form and direction of this effort, was more difficult and controversial. Apart from Conrad's proposal, made once again, to strike from two directions against Siedlce, there were two schemes under consideration. One was from Ludendorff on behalf of Hindenburg; the other from von Seeckt, representing Mackensen. In the sequel, Falkenhayn accepted the latter, with additions of his own.

In Section I. of this article, mention was made of the geographical barriers, both flank and transverse, of the " northern corridor," and it was noted that the tendency of the latter was to turn southward in their upper courses, so that a series of gateways existed along the inner flank of the corridor. Seeckt's proposal, first made as early as June 15, was to wheel the two Mackensen armies sharply northward, pivoting at about the mouth of the San, to the line Ivangorod-Wlodawa, with, as flank-guard against dangers from the Luck direction, the Austrian II. Army, which should advance, in échelon from the left, toward Vladimir Volhynskiy, E. of the Bug. Only the South Army and the VII. Army would remain to drive the Russians remaining S. of Brody out of E. Galicia. The Austrian I. Army on the other side of the Vistula was to conform by pushing the enemy back to about Josefow, and, itself crossing there, to come into line to the S.E. of Ivangorod, thereby allowing Mackensen (I., IV., and XI. Armies and Beskidenkorps) to condense on his right wing and drive forward on the Bug, with on his right, beyond the river, a deep échelon which could pull out and outflank the enemy's left wherever it was found. To this scheme it was open to Falkenhayn to add a similar enveloping element on the northern flank.

But, in accepting the plan, Falkenhayn and Conrad modified it considerably. The situation in E. Galicia did not seem to them to justify the plunge of the II. Army northward on Vladimir Volhynskiy. They therefore reserved this army, as heretofore, for operations in the Brody direction, and instead withdrew the I. Army from the central salient—Woyrsch extending, in place of it, to the Vistula—and reconstituted it about Rawa Ruska with orders to line the Bug as a flank guard in proportion as Mackensen progressed. It was during this regrouping that the Russian counter-attack of July 7, above mentioned, was delivered. A serious objection to Seeckt's scheme was, in Falkenhayn's eyes and probably in Conrad's also, the fact that the II. Army would have become involved in the marshes of the Pripet region N. of Vladimir Volhynskiy. Both Seeckt and, incidentally, Ludendorff considered the difficulty of this country to be exaggerated, and Falkenhayn admitted after the event that this was so. In any case much would have depended upon the scale of the operations E. of the Bug, and this was just the unknown factor in the problem.

Falkenhayn therefore limited the Mackensen operation to the area between the Vistula and the Bug, thus turning some, but not all, of the transverse barriers by their inner gates. Reckoning upon obstinacy in the command and slowness of the machinery of his opponent, he considered that it would suffice to come in upon the rear of the Russian centre during its presumed evacuation of the central salient, at some point between Siedlce and Brest-Litovsk. But he was aware that the centre of gravity of the whole Russian line now lay opposite Mackensen, who would be called upon to make a purely frontal advance through country that was destitute of railways and would certainly be devastated. He therefore intended to deliver an additional blow from the other wing generally in the same direction; that is, to reënforce Gallwitz to such strength as would enable him to force, in succession, the Russian XII. Army's Przasnysz lines and the Narew barrier, and so to descend upon the same region from the other side, N. of the middle Bug. Thus he expected to obtain the maximum result that was possible, and within a time-limit set by the forthcoming French offensive in Champagne and by the Bulgarian peasants' harvest.

Ludendorff, on the other hand, aimed at the " annihilation " of the Russian armies and thereby the certainty of winning the war. He argued that Mackensen's movement on the left of the Bug would be a slow frontal drive; that a Gallwitz offensive toward the Narew would be brought to a standstill, or at the least reduced to the condition of Mackensen's, very little beyond the Narew; that Byelostok could not be reached with certainty by an offensive from the VIII. Army front (Osowiec), such as had been projected in the Masurian campaign, though he and Falkenhayn were agreed as to this being, ideally, the decisive point; that Kovno and Grodno effectively held the middle Niemen line; and that, in effect, the only practicable envelopment was one which, starting from the N. of Kovno, swept round and invested that fortress and swung in by Vilna toward Molodechno and Minsk. The cross-barrier of the Vilya, and that alone, was sufficiently far hack from the present Russian front to ensure the cutting-off of the entire Russian army in Poland, Polyesie, and southern Lithuania. To complete the " Cannae," he proposed that the Mackensen group of armies should place its centre of gravity on, and even E. of, the Bug, as laid down in Seeckt's original plan.

To understand the significance of this proposal and the arguments for and against it, it is necessary to realize the new position of affairs on the extreme left of Hindenburg's front. At the close of the Masurian winter operations the X. Army

leaned to the left on the lower Niemen, rather east of Tilsit. In March there had been some advances and retreats on both sides but no substantial change in the situation. A raid on Memel, beyond the left flank of Eichhorn's Army, by a small body of Russian militia from Libau (who were expelled after doing some damage) was the only incident of importance N. of the Niemen till, in mid-April, Hindenburg received orders to deliver feint attacks in order to divert attention from the forthcoming Gorlice offensive. He chose, for this purpose, the region N.E. of Tilsit, and formed a mobile army group of infantry and cavalry divisions under General von Lauenstein. In this quarter the Russians had only small forces, and the advance could be carried out in three separate columns, thus covering an enormous front. In all, 3 infantry and 3 cavalry divisions were sent out on April 27, by Memel toward the Vindava, by Tauroggen on Shavli (Schaulen, Szawle), and by Yurburg on Sredniki and the Duhissa line. A small raiding body, in conjunction with light naval forces, took possession of Libau early in May.

Lauenstein's movement was unexpected, and his left column penetrated to Mitau before the reaction set in. The others made good Shavli and the line of the Duhissa, and during May and June a series of fierce battles on a small scale took place all along this line. The Russians brought up considerable reinforcements under the V. Army staff, and the first object of Lauenstein's enterprise thus attained marked success. But, like other wide extensions of front in the war, as soon as serious infantry fighting opened, manœuvre began to call upon reserve resources for its maintenance. Two infantry and 2 cavalry divisions were added to the German force, which became the "Army of the Niemen" under Otto von Below, Scholtz succeeding this officer as the head of the VIII. Army. Thus, at the end of June, when the plan of future operations was being settled, the ground was prepared for the manœuvre advocated by Ludendorff. From Shavli, with flank guards set out successively towards Riga and Dvinsk, the Niemen army could, after being made sufficiently strong to defeat the Russian V. Army assembled in front of it, turn Kovno and reach the Vilya line long before the Russians in retreat from western Poland could do so. On the other hand, so grave a peril would clearly bring into existence a new Russian army of relief in the Riga-Dvinsk-Petrograd region, and this army would make short work of a few flank-guard divisions facing Riga, Jakobstad and Dvinsk. One necessary condition of Ludendorff's plan, therefore, was heavy reinforcement of the Niemen army; another the reduction of Kovno, so as to clear a direct and safe line of communications Insterburg-Vilna and to bring the X. Army into action E. of the Niemen. From Falkenhayn's point of view, however, the eccentricity of the whole manœuvre was its gravest drawback. He doubted whether so distant an operation would affect the situation of Mackensen, but especially whether it would not become just that plunge into the unlimited interior of Russia which, with his time-limit fixed, he dreaded above all. Operations N. and E. of Kovno were permissible, in his opinion, only for hunting down an army already in dissolution, not as a preliminary to the battle that was to bring about that dissolution.

Such, in sum, were the elements of a controversy between Falkenhayn and Ludendorff, which in the course of the summer created a serious breach between the Supreme Command and the commander-in-chief East, and undoubtedly handicapped the operations, for Falkenhayn never swerved from his intention to close down the campaign as soon as an "adequate" result had been achieved, and Ludendorff on his side returned to the charge at every opportunity, with the result that the few available reserves were handled without singleness of purpose.

The Ludendorff plan, first proposed as early as June 7, was discussed fully at a conference on July 2, in the presence of the Emperor William, who, bound by the practice of the German army either to follow the counsels of his sole and responsible adviser or to dismiss him, chose the former course.

It was decided therefore that Mackensen, after completing his wheel-up, should advance with all possible energy against his immediate opponents between the Vistula and the Bug, with the reconstituted Austrian I. Army protecting his right flank by making good the line of the upper Bug as he advanced; and that Gallwitz's army group, reinforced, should break through at Przasnysz and on the Narew. When Gallwitz's operation, with its immediate relief to Mackensen, should have been completed, then Falkenhayn was prepared to allow an extension of the offensive to the middle Niemen region.

On Mackensen's front the wheel-up was completed in the midst of a heavy Russian counter-attack, and the advance that was to follow was involved in great difficulties from the outset. His three armies—from left to right, the Austrian IV. and the German XI. and Bug Armies (the last newly formed under Linsingen)—had not moved appreciably when Gallwitz's attack was delivered. The Russians had massed considerable forces to deny access to the inner gates of the corridor, and under cover of their activity had already begun the evacuation of the central salient. There all the old line had been already given up S. of Inowlodz on the Pilica, and, on Mackensen's intention becoming evident, the retreat was continued to the line of the Vistula itself, where, however, the foreground of Ivangorod and, especially, the great entrenched positions west of Warsaw continued to be held in force. The German IX. and Woyrsch Armies in front of this line, now constituted as a group of armies under Prince Leopold (probably in order to give Falkenhayn a force independent of both Hindenburg and Conrad), had been weakened and could do little more than follow up, boldly on the right but very cautiously on the left where the Warsaw positions and Novogeorgievsk imposed respect.

When Woyrsch reached the region of Ivangorod (July 21) so little progress had been made on the Mackensen front that Conrad proposed that Woyrsch should cross the Vistula above that fortress, so as to intervene in rear of Joseph Ferdinand's opponents. This movement, which would have thrown the axis of Woyrsch, and eventually that of the IX. Army also, away from the region of the middle Bug and put an end to all hopes of cutting off the Warsaw group of the enemy, was opposed by Falkenhayn and also by Mackensen, and Woyrsch received orders to cross the Vistula below Ivangorod, as he did on the night of July 28-29 near Maciejowice. The IX. Army meanwhile felt its way forward to the Warsaw lines and the S. front of Novogeorgievsk.

Before any of these movements were under way—largely indeed with the intention of helping them to get under way—the Gallwitz group, reinforced from the central salient by 4 divisions to a strength of about 15, had opened its offensive on July 13-16 by breaking through the Russian XII. Army's trench-lines at and west of Przasnysz (*see* NAREW, BATTLES OF THE). On the night of the 17th Gallwitz stood within range of Ostrolenka on the left and the N. defences of Novogeorgievsk on the right. But a new and more severe effort was needed for the forcing of the Narew line itself. Russian counter-attack forces arrived in time, and it was only on Aug. 8—more than 3 weeks after the offensive began—that the Gallwitz group, now styled XII. Army, had made good a line E. of the river defined by Serock-Wyszkow (on the Bug)-E. of Ostrow-R. Ruz, the last named being occupied by the right of Scholtz's VIII. Army which had advanced in sympathy. The right of the German XII. Army meantime, W. of the Narew and facing S., was holding its own, not without considerable difficulty, against repeated counter-attacks issuing from the Novogeorgievsk defences, where the Grand Duke maintained large mobile forces up to the eleventh hour—and indeed beyond it.

In these 3 weeks Mackensen's right, the Bug Army, had been engaged (*see* BREST-LITOVSK, BATTLES OF) by the Russian XIII. Army, at the halt on almost every line of E.-W. streams available. It had fought on the line Grabowiec-Gruhieszow from July 19-21, on that of Chelm-Annopol from the 21st to the 31st, and along the Ucherka river and at Sawin in the first days of August. The XI. Army, with better conditions, had advanced first astride and then east of the Huczwa, and by Aug. 6 had reached Lubartow-Sawin; while Joseph Ferdinand had—without the suggested flanking assistance from Woyrsch—reached the

line Novo Alexandryn–Luhartow. In the centre Woyrsch had extended his Muciejowice bridgehead and was passing all his forces over the Vistula for the advance on Siedlce–Lukow, and under this threat the Russians had entirely evacuated the left of the Vistula. Warsaw city fell on the 5th, though the German IX. Army was unable to force the river—there a kilometre broad—till the 8th. Ivangorod was evacuated on the 5th. Thus the German front had assumed a still more pronounced N.E. direction than at the beginning of the Mackensen manœuvre; owing to its battle and route conditions, Linsingen's Army was back instead of forward of the alignment, and the Russians had retreated clear of the dangerous central salient to a line marked by the Liwiec, the Bystrica and, facing Mackensen, the middle Wieprz, the Swinka and the Ucherka. The Austrian I. Army, occupied principally with flank-guarding Linsingen along the Bug, had advanced its right to Vladimir Volhynskiy but no farther. On the other flank of the Russian retreat Gallwitz was firmly held for the time being. In other words the Russians—handled with great skill by General Alexeiev, commander-in-chief of the N.W. front, were successfully effecting their retreat to that line (Kovno–Grodno–Brest-Litovsk–W. of Kovel–Luck–Duhno) which had been already in peace-time regarded as the line of safety for deployment. In territory, they had abandoned no more than they would have been prepared to give up gratuitously in their pre-war concentration scheme.

But this in itself was, after a year of warfare, a confession of defeat. The enormous losses of that year in men and material—losses such that the great army of peace-time with all its resources had practically ceased to exist and the stocks of arms no longer sufficed to equip even the men in action, let alone new formations, with rifles—left no doubt that as a dominant factor in the war Russia was out of the reckoning. In the light of after events, the decision to continue the struggle after the loss of the San line in June is seen to be the first step to the Russian Revolution. Yet, on purely military grounds, it was justifiable on the assumption that the French effort to break through the Champagne front would succeed. Only this confidence in victory in September, indeed, can explain the stagnation on the Western front from April to August (broken only by the May battle in Artois), enabling Falkenhayn to withdraw some 12 divisions for the Eastern operations.

By August it was evident that the chances of cutting off any considerable formed army of the Russians in the Kielce region was at an end, and again there came up on the German side the controversy between Falkenhayn and Ludendorff as to what the operations were intended to achieve. Falkenhayn held firmly to the view that the Russian army must be beaten before any wide enveloping movement was undertaken to surround its débris. Writing after the war, he maintained the same opinion, only reproaching himself with not having compelled G.H.Q. East to give Gallwitz 20 divisions instead of 14. And certainly, if prisoners and booty were considered, he had in fact inflicted what by all military standards was a "sufficient" or "decisive" blow—for by the middle of Aug. the Russian losses in prisoners alone had reached the figure of 750,000 since May 1, nearly 50% of their combatant strength as it had been at the end of April. But the time-limit was close at hand, and the withdrawals of forces to France and Serbia, delayed as long as possible, had now to be begun. The weeks remaining must, according to Falkenhayn, be devoted to inflicting as much additional loss on the Russians as was possible by frontal pressure coupled with flank attacks on the middle Niemen and east of the Bug, *i.e.* in the immediate vicinity of the frontal fighting, and possibly raids by light forces on the communications behind Kovno and Brest-Litovsk. At a suitable date the operation would be closed down, and the best line of defence taken up as a winter front.

Ludendorff, on the contrary, considered that the actual annihilation of the Russian armies was the only "sufficiently decisive result" that would give freedom of action in the West, and with renewed insistence—which went as far as a personal appeal by the Field-Marshal to the Kaiser—demanded the reinforcement of his left (Niemen army) with a view to quick swooping down on Vilna and Molodechno and the closing of the "corridor." The axis Orany–Lida, originally suggested, was now too near for the required effect, but the principle was the same, and the movement would originate from a more favourable situation of the Niemen army than that existing in June. Preparations for the attack on Kovno by the X. Army were already well advanced, and Ludendorff considered that even at this stage complete success would be possible.

At this period the fighting on the Vindava–Schavli–Dubissa line had definitely turned in favour of the German Niemen army, the Russian V. Army receiving little or no further reinforcements when Mackensen's and Gallwitz's attacks developed. Below was progressing beyond the line named in each of the three directions Mitau–Riga, Poneviesh–Dvinsk, Keidamy–Wilkomir, and about Aug. 1 his various columns, totalling about 7½ inf. and 5½ cavalry divisions, were approximately on the line River Aa–R. Musha–E. of Poneviesh–Keidamy. To the southwest, the German X. and Russian X. Armies were still making war in the same fashion as in March, the Germans based on the Suwalki–Schali lines, and the Russians on their Kovno–Niemen–Grodno fortifications, making periodical thrusts in the region between. But the last important Russian thrust was delivered early in May, as a "relief offensive" toward Schali; and the German reaction became a methodical advance toward Kovno and Olita, which at the time here considered brought their left almost up to their opponent's stronghold. Behind the German advanced line preparations had been made for the siege of Kovno, an essential part of the scheme which Ludendorff still advocated.

The Final Phase.—It was evident that the scheme of bringing Below and Eichhorn down upon Vilna and Molodechno, and capturing Kovno in time, would call for the reinforcement of either or both, and, on this ground principally, Falkenhayn preferred to continue the campaign on the same lines as before, though a little later he conceded to Hindenburg freedom to dispose as he chose of the forces in his own area and to Mackensen freedom to pass to the E. of the Bug. Conrad, meantime, was planning an operation in East Galicia with the II., South and VII. Armies.

Thus the last phase of the tremendous campaign consists of 4 parts: (*a*) the frontal drive of (right to left) the Bug Army, the XI., Woyrsch, IX., XII. and VIII., (*b*) the attack on the north flank and the rear of the "Corridor" by the German X. and Niemen Armies, (*c*) the N.E. swerve of the Bug Army and the A.-H. I. Army, and (*d*) the autumn campaign in E. Galicia. All these were carried out without any great regrouping or reinforcement, and indeed, as regards (*a*) the forces concerned, were gradually reduced in order to form the army for the Serbian front and to increase the reserve in France. In the case of the operations in E. Galicia, the Russians followed a clear purpose and the parts of their efforts were coördinated. But elsewhere, under the tremendous pressure of the row of hostile armies stretching from Lomza to Wlodawa and Vladimir Volhynskiy, the only general policy was that of gaining time at the expense of ground and of avoiding envelopment at all costs, and the day-to-day situations were met as best they could be. On the German and Austrian side the offensive energy of the troops was beginning to approach its limit, except as regards troops N. of Grodno, so that it may be said that the allied left and the Russian left alone retained the capacity for fresh achievement, while the rest were wearing each other out at an increasing rate.

The central campaign, between the Bohr and the Bug, may best be summarized by recording the battlefields of each of the German armies in succession.

Protected on its right by the Austrian I. Army, the Bug Army fought and won the battles of the Ucherka (Aug. 7–12) and of Wlodawa (Aug. 13–17), and in concert with the XI. Army continued its advance northward along the Bug against Brest-Litovsk. Meantime, the crossing of the Bug was authorized in so far as concerned the establishment of bridgeheads; and in carrying out orders with this object the German subordinate

leaders became involved in fighting E. of Wlodawa, which inevitably formed the starting-point of an offensive against the eastern communications of Brest-Litovsk. By Aug. 21, then, the greater part of the Bug Army was engaged on the line of the Kapajowska from its mouth to Switiaz lake inclusive, well inside the region of the great marshes; the remainder (Beskidenkorps only), still west of the Bug, was nearing the outworks of Brest.

To the left of the Bug Army, the XI., already being reduced for the forthcoming Serbian campaign (for the conduct of which its staff was presently withdrawn), moved forward correspondingly against the W. of Brest. On Aug. 19 its left had reached Janow on the Bug below the fortress, while the Beskidenkorps stood at Koden on the same river above it. To the left of the XI. Army, again, the Austrian IV. Army at that date lined the Bug between Janow and Niemirow; and beyond Joseph Ferdinand, already N. of the river, was Prince Leopold with Woyrsch's and his own armies, which, as soon as they had debouched from Ivangorod and Warsaw, had made rapid progress, as the Russian centre retreated at the fastest possible pace to escape while Gallwitz and Mackensen were still being held off. The German IX. and Woyrsch Armies stood, on Aug. 19, N. of Niemirow, facing the line of the Pulwa and the Nurzec on which the Russians were preparing to make a stand.

Meantime Gallwitz, in his bridgehead position in the angle of the Bug and Narew, had overcome the Russian counter-attacks, but not before their purpose of keeping open the railways and roads for the retreat of the Warsaw and Ivangorod forces had been achieved. The battles of Ostrow (Aug. 8–10) and Tschishew-Samhrow (Aug. 11–12) and the advance in the direction of Bielsk which ensued were thus similar in character to the operations of the IX. and Woyrsch's Armies, viz.: a direct pursuit where an envelopment had been hoped for. At the date of Aug. 18–19, Gallwitz stood between the Nurzec and the upper Narew, facing Biala, where the Russians were prepared.

The rightmost troops of the XII. Army, viz. those which in the battle of the Narew were facing south against counter-attacks from Novogeorgievsk and the strong points of the lower Bug, had now been combined with the leftmost troops of the IX. Army for the siege of Novogeorgievsk, in an army group under von Beseler, the captor of Antwerp; and the siege, pressed with energy, was nearing its close. On the 20th the place, with a large garrison, surrendered. On Gallwitz's other flank, the right of the VIII. Army had conformed to his advance and was taking the direction of Byelostok; its centre had mastered Lomza and Wiszna on Aug. 10; and its left was again, as in Feb., battering Osowiec, which fell to the superheavy artillery on the 22nd. Kovno, as will be seen, had already fallen on the 18th, to the attack of the German X. Army.

Throughout these pursuit operations large numbers of prisoners continued to be taken by the Germans, and the Russian fortress artillery swelled enormously the total of captured guns. At Novogeorgievsk some 85,000 men and 700 guns were taken. Shortly it was to be the turn of Brest-Litovsk and Grodno, though these places were not defended after the withdrawal of the battle-lines outside them.

The later stages of the frontal pursuit may be very briefly dealt with. The general direction of the Woyrsch, IX. and XII. Armies was eastward. From Aug. 10–24 Woyrsch and the IX. Army were engaged in mastering the Pulwa-Nurzec line, on which the Russians delayed their opponents long enough to cover the evacuation of Brest-Litovsk against interference from the N.W. or N. From the 25th to the 31st these two armies were involved in a fresh series of combats in and about the "primeval forest" of Byleovitsa. Meantime the XI. and (till its withdrawal) the Austrian IV. Armies, with the Beskidenkorps of the Bug Army, had attacked Brest-Litovsk concentrically from the W. and S., and the last Russian rearguards had been driven out of the evacuated stronghold on the 26th. The Germans and Austrians then continued the pursuit eastward, where the operations of the Bug Army and the Austrian I. Army (presently to be described) came into line with theirs in the early part of Sept. The XII. Army drove the Russians from the Bielsk positions on the 26th, from the Swislocz river a few days later, and from the Naumka-Wereczya line on Sept. 4, at which date the IX. Army and Woyrsch had at last debouched from the Byelovitsa forest towards the Jasiolda river.

In general, the effort of the Bug, XI., IV., Woyrsch and IX. Armies in the earlier stages of pursuit had tended to crowd the Russians into the area round Brest-Litovsk, and at a certain stage in this process the Bug Army had been authorized to push through the marshes E. of the river so as to reach the line of communications Brest-Litovsk-Kobrin-Pinsk. At the same time the Austrian I. Army about Vladimir Volhynskiy advanced to Kovel, and thence eastward (see ***Autumn Campaign in East Galicia*** p. 907) while from Kovel its cavalry worked up through the marshes northward to join the swinging right wing of the Bug Army. But that army, although it drove the retiring and diminishing forces of its opponent N.E. from the Kapajowska to Kobrin, was unable to reach that point before the Russians evacuating Brest-Litovsk had flowed past it. The Russian rearguard stood to fight on a line N.W.-S.E. through Kobrin, but, the Austro-German Cavalry Corps of General von Heydebreck from Kovel arriving on their flank, they soon fell back to the oblique line of the Dnieper-Bug canal, where they were temporarily secure against all but frontal pressure. Thus in this quarter too the pursuit became a direct one. The Russians were driven by the Bug Army and by what remained of the Austrian XI. and Austro-Hungarian IV. Armies—the whole now commanded by Linsingen—out of the canal lines in the battle of Horodec (Aug. 31–Sept. 1) and out of the defences of Drohiczyn-Chomsk (Sept. 4–6). But Linsingen's offensive, more and more hampered by poor communications, came to an end with the occupation of Pinsk on Sept. 16, and positions were taken up here which remained unchanged till the end of the war.

With the almost simultaneous capture of Brest-Litovsk, Bielsk, and Grodno (the last named fell to the German VIII. Army on Sept. 2–3), the Germans obtained possession of that line across the northern corridor which had usually been regarded as the Russian stabilization line. Falkenhayn, however, took full advantage of the shortening of front which resulted from the directions taken by his armies, and then at last Ludendorff's scheme came into play.

Such an operation as Ludendorff contemplated, or at least one from the middle Niemen, Falkenhayn had been willing to agree to from the first; and as the occasion approached he relaxed his hold on Hindenburg's dispositions, stipulating only for the observance of his general directions and for the release of certain divisions for the West. In practice he approved the attack on Kovno. Ludendorff promptly took advantage of this, and the intended wheel-in upon the rear of the "corridor" was already in progress before the fall of Grodno and Brest-Litovsk. On Aug. 8 the X. Army was able to begin the siege of Kovno. Ten days later the fortress was in its hands—even earlier than at Novogeorgievsk, Osowiec, and Brest-Litovsk. On condition of strengthening either the Niemen army or the left of the X., therefore, Ludendorff's plan had become feasible, if feasible at all, while masses of the enemy were still south of Brest-Litovsk, on the Pulwa and the Nurzec, about Bielsk and Byelostok and Grodno. At that date, Aug. 18, the Niemen army had pushed its left columns close up to the Riga-Uxküll bridgehead on the Dvina, and to Friedrichstadt on that river, whence its centre and right ran southward along the Jara and Sventa to the north side of Kovno. It was still very strong in cavalry, but some of its transport had been taken for the armies pursuing through the devastated areas to the South.

Nevertheless, no serious advance was made to the westward from Kovno for more than a week, and even then part of the X. Army swerved full to the south against Olita to open an advance in the direction of Orany, and also to help the VIII. Army in cutting off Grodno, now a pronounced salient. At this late stage Ludendorff himself had doubts of the efficacy of the westward movement, and for a moment contemplated taking the direction favoured by Falkenhayn, viz.: Orany, Lida, Baranovichi. Not only was this the shortest route to the enemy's

heart—the shortest, that is, as measured by the time necessary for concentrations and for rebuilding routes—but it offered hopes of driving a large mass of the enemy into the marsh region round Slonim, where the avenue of escape was narrowest (whereas at the latitude of Vilna–Molodechno the corridor broadens out considerably). However, he chose, in the end, to follow the current scheme of operations, as offering "annihilation" of the enemy as a prize, though admittedly that prize might escape him. On the 28th, therefore, with the expressed or implied consent of Falkenhayn, the X. Army was ordered forward on Vilna, with centre of gravity on the north wing, north of the Vilya. Reinforcements were collected from the troops lately besieging Novogeorgievsk and from the VIII. Army, which, after the fall of Grodno, would evidently be crowded out of the line. The Niemen army was directed to press up to the Dvina bridgeheads and, especially, up to Dvinsk, to coöperate with its left wing in the operations of the X. Army north of the Vilya, and to prepare a mass of cavalry to break through the thin line of the Russians near Swentsiany and seize or destroy the railways at Molodechno and Minsk.

The last great battle of the campaign, known as that of Vilna-Molodechno, began after the Grodno episode had been closed on Sept. 9. At that date Linsingen was advancing on Pinsk, Woyrsch and Prince Leopold driving the enemy slowly from one river-line to the next, over the Jasiolda, in the direction of Slonim; and Gallwitz and the remnant of the VIII. Army were pressing slowly forward up the Niemen in the same direction. The Niemen army was, by its activity between Riga and Dvinsk, forestalling and perhaps diverting the attack of new Russian forces which were coming up from the Baltic provinces. From Wilkomir, north of the Vilya, to Orany, the X. Army engaged the very heavy forces that the Russians had collected for the last effort to hold the flank of their corridor—the final act of command of the Grand Duke Nicholas before the Tsar took over the control from his able hands. The German offensive progressed slowly, like all offensives against the Russian flanks in this campaign, but after some days it was judged that the forces on the Dvina and amongst the Dvinsk lakes had obtained sufficient security for the left flank, and on Sept. 11 the German cavalry divisions broke through the cordon west of Novo Swentsiany and made for Swentsiany and Molodechno. On Sept. 14 the horsemen reached and broke the Vilna-Molodechno line at Smorgon. At Wilejka and farther north at Glubokoye they cut the vital Lida–Plotsk line. A party even reached the Minsk–Orsha line at Smolewice.

This last crisis was also the most dramatic. The first wave of cavalry was followed by others till about seven divisions were collected about Wilejka, Smorgon and Molodechno. But, recovering from their first surprise, the Russians quickly sent troops from Vilna and from Minsk, as well as from the south-east of Dvinsk, to clear their intercepted lines of retreat. These had to be recovered at all costs, for, while the forces retiring before Gallwitz, Leopold and Woyrsch still had the lines focussed on Baranovichi at their disposal, these could not help the northern masses, and it was in the north, towards Vilna, that the centre of gravity lay.

Thus a race to build up forces about Smorgon, Molodechno and Wilejka set in. The Russians, having the better communications and consequently the larger forces, won it. They drove back the German cavalry, after a continuous skirmish of five days, to the west of Smorgon and the northwest of Wilejka. Two days later the first infantry divisions arrived on the German side from the left of the X. Army. The détour of these troops along the north bank of the bending Vilya had enabled the Russians, moving on the shorter line, to reopen their line of communications; and, with this, the battle of Vilna became, like the battles farther south, a slow frontal drive. Thereupon Falkenhayn ordered operations to be broken off and more divisions to be withdrawn for other theatres, and fixed in general the line to be taken up as a winter line. The concluding operations of the campaign, mostly completed in early October, consisted in the methodical advance of all armies to this line, which, so far as the Hindenburg, Leopold, and Linsingen groups were concerned, ran from Tuckum, on the gulf of Riga, past the south side of Riga and parallel to the Dvina to Novo Alexandrovsk, and thence southward by Lake Drisvyaty and Lake Naroch, Smorgon, Krewo and Baranovichi to Pinsk, south of which point Linsingen's right came into touch with the left of the Austrian operations in East Galicia.

Autumn Campaign in East Galicia.—In East Galicia the pursuit of the Russian VIII. and IX. Armies, after the Grodek–Lemberg break-through in June, had been left by Conrad and Falkenhayn to the Austrian II. Army, the German-Austrian South Army, and to Pflanzer-Baltin. Although the first impressions of the victors in that battle had been that the Russian armies remaining in East Galicia were incapable of more than retreat and rearguard fighting for a long time to come, in fact it cost the Austrians and Germans much fighting and manœuvring to establish themselves on the line of the upper Bug and the Zlota Lipa; and Pflanzer-Baltin was at one time subjected to a heavy counter-attack by General Lechitsky's Army, for in this quarter the Russians had an ample supply of reinforcements in their Odessa army. Towards the end of July, however, the fighting in Galicia died down.

Towards the end of August, as a part of the same final offensive act which produced the battle of Vilna–Molodechno in the other flank, Conrad initiated a campaign which was intended to confirm the separation of the northern and southern groups of the enemy and to clear the latter out of Austro-Rumanian territory definitively. The thinness of the defensive cordon in the Pripet marshes, revealed by the lack of serious opposition to the movements of Puhallo's I. Army on and beyond Vladimir Volhynskiy, and the advance of Heydebreck's Cavalry Corps across the swamps and forests to Linsingen's Drohiczyn battlefield, led the Austrian command to make its effort on the north side of the Lemberg–Brody watershed. Profiting by the general shortness of the line between the Bug and Vistula, Conrad withdrew the Archduke Joseph Ferdinand and the IV. Army from the Brest-Litovsk field of operations in the last few days of August, concurrently with the withdrawal, mentioned p. 906, of the German XI. Army for Serbia. During the gradual withdrawal of the IV. Army, Puhallo began his offensive from the line Vladimir–Volhynskiy–Kovel in a south-easterly direction.

The fighting which followed is described in the article Rovno, Battle of. The incoming of the Austrian IV. Army on Puhallo's left, on the one side, and the arrival of reinforcements for Ivanov's VIII., XI. and IX. Armies, on the other, led to the battle spreading along the whole front from the Pripet to the Pruth. In sum, the Austrians, after advancing from Kovel to the rivers Goryn and Putilowka N.W. of Rovno, and from the Zlota Lipa to the Galician Sereth, were checked and driven back by a counter-attack group formed by Brussilov's VIII. Army in the region of Rajalowka. The rest of the Russian front taking up the movement, the Austrians were driven back from the Sereth to the Strypa, and from the Horyn–Stubiel line to the upper Styr and Stokhod, while the centre held practically all its gains. From the fourth week of September the battle, after some further fluctuations on the left, became a stabilized trench-warfare conflict which dragged on till mid-November, when both sides settled down in their winter lines. These ran from the Pripet along the Styr and the Kormin and thence past Dubno to Zborow and so along the Strypa. From the Strypa mouth to the Sereth mouth, the Austrians retained positions north of the Dniester, and from that point Pflanzer-Baltin's front substantially followed the frontier to Rumanian territory E. of Czernowitz. Thenceforward up to the opening of the great Russian offensive in 1916 the only important operations which took place in East Galicia were the relief offensive known as the "New Year battle" (*see* Strypa-Czernowitz) initiated by the Russians in the hope, which was not realized, of calling off Austrian troops from Montenegro, and the Russian capture of the Dniester bridgehead of Uzcieszko on March 19—a diverting attack in aid of the spring offensive of the north.

(C. F. A.)

IV. Russian Front, 1916–17

Operations in Russia and East Galicia, 1916 and 1917.—About the end of 1915 and the beginning of 1916 the rival belligerents in the World War were confronted with the necessity of making vital decisions. For the Central Powers and their allies the past months had been rich in results. In the Balkan Peninsula Bulgaria's entry into the alliance, and the conquest of Serbia and Macedonia, had opened the way to Constantinople and Asia Minor. The Allied army in the East had tried in vain at Salonika to bring about a change in the state of affairs. The Entente troops had been withdrawn from Gallipoli. Even the bloody battle in East Galicia and on the Bessarabian frontier at the New Year had had no effect upon the general situation. Against Italy, and in the French theatre of war, the armies of the Central Powers had successfully maintained their position.

The chief of the Austro-Hungarian General Staff, Gen. Conrad von Hötzendorff, proposed to clear up the situation in the Balkans as far as possible. Rumania must be forced to give up her ambiguous attitude by an ultimatum, supported by the presence in South Hungary of a powerful force of troops. Montenegro and at least the north and centre of Albania must be occupied by the Central Powers. These measures having been taken, an offensive, prepared in the meantime, on Salonika would end the campaign in the Balkans. But the chief of the German General Staff, Gen. von Falkenhayn, had since late autumn, 1915, remained with his plans in the West in the French theatre of war. He pronounced against an offensive at Salonika on several grounds, and his view of the political, military and technical difficulties of such an undertaking could not be waived aside. The German Gen. von Seeckt also upheld Falkenhayn in this, on the strength of a conference with the Bulgarian Army Command. While the plan of an attack on Salonika was rejected in this manner, pressure on Rumania was now likewise deemed unnecessary, since the military successes of the Central Powers had meanwhile caused a more conciliatory attitude at Bucharest.

As regards the Austro-Hungarian Army Command's plans for dealing with Montenegro and Albania, Falkenhayn tried to postpone these indefinitely. But Conrad clung to his point and carried out his intentions, more or less against the will of his German colleagues, whereupon a most acute personal quarrel broke out between the two generals, lasting nearly a month.

This quarrel, in the course of which Gen. Conrad had the satisfaction of seeing his troops take the Lovchen (Lovčen) and subdue Montenegro, obviously laid no promising foundation for their common decisions in the future.

The idea of bringing about a decision in the war by a campaign against Kiev or Odessa in the spring of 1916 seems to have engaged political rather than military circles in Vienna and Berlin. In the latter the Russian operations in 1915 only strengthened the old conviction that the Russian armies—thanks to the illimitable area of operations and the skill of the Russian leaders in retreat—would always slip their heads out of the noose again, and that any further advance of the Central Powers towards the east could only result in an inconvenient extension of the front. The war, according to the view of both the General Staffs, could only be won against the western opponents. Conrad proposed a combined offensive against Italy. An annihilating blow delivered against this enemy would have been not only in accord with his personal feelings and those of his armies, but was worthy of consideration on many other important grounds. The tension on the Italian front was increased for the Austro-Hungarians by every new defensive battle; the Italian menace to Trieste became more intolerable week by week. On the other hand, Italy was easier to overthrow than France—or England, for that matter; and, as often before in history, the fate of the Rhine might be decided in the plain of the Po. Falkenhayn did not refute these arguments; but he was doubtful whether, in the first place, it would be possible to force Italy to break with the Entente, in view of her dependence on England, and, in the second, whether even if, contrary to expectations, Italy's overthrow should be brought about, the Western Powers would take the loss of this Ally so very much to heart. Falkenhayn was convinced that the decisive campaign could be fought only in the French theatre of war. Conrad held to the other solution, but declared himself willing to place a few particularly good fighting corps at the disposal of the German Higher Command for use in France. This offer was declined by Falkenhayn both on military grounds and as a matter of prestige. He proposed as an alternative that his allies should take over, in addition to the 400 km. of front which they were defending between the Bessarabian Pruth and the Pripet (Prypeć) against the Russians, a further portion of the Lithuanian front stretching towards the north. In this way it would become possible to set free more German troops for the attack on Verdun. But Gen. Conrad could not bring himself to accept this purely passive rôle, and the result of this difference of opinion was that the two empires of central Europe divided their forces, the one proceeding to the attack in France, the other to the Venetian mountains.

The Eastern Front in March 1916.—For the execution of these attacks, forces that had been set free in the Balkans were brought up and others from the Russian theatre. The German eastern troops were, between Oct. 1915 and Feb. 1916, reduced from 56 to 45 or 47 inf. divs., not to mention the exchange of other fighting troops for less serviceable units. Heavy artillery and technical supplies were also withdrawn and sent to France, but these could be adequately replaced, thanks to the mechanical power of German industry.

The Austro-Hungarian eastern front in March 1916 was so organized as to have 6 divs. less than at the close of the fruitless October campaign in 1915. To balance this, however, a series of regts. and batts. were brought up from other divs., so that the Austro-Hungarian eastern armies gave up, in all, 120 batts. for the attack on Italy. The drafts for the infantry in this fighting force were supplied mostly from home at regular intervals, the drafting reserve being overfilled owing to the slight losses entailed by the war of positions. Out of this superfluity of men the regts. formed 5th and 6th Batts. Thus there could be no question of numerical weakening on the Austro-Hungarian eastern front. Far more heavily weighed the fact that the best and most reliable troops had been picked for the Italian attack, including nearly all the German-Austrians and a great proportion of the Magyars. The eastern armies were seriously weakened thereby on the moral side; and the militia-like character, which the Austro-Hungarian army had begun to take on in the Carpathian battles in the spring of 1915, now became particularly apparent in the east. Still more severely felt was the withdrawal of the whole of the heaviest artillery, and a considerable portion of the medium-heavy, to the Italian theatre, and the considerably smaller share of technical supplies which had been assigned to the eastern front when these were divided.

In the beginning of March there were about 40 Austro-Hungarian and 46 German divs. on the Russian front. Of these, 42 German and 2 Austro-Hungarian held the front (Pinsk) between Riga and the Pripet and were under the German Higher Command; the other half of the fighting forces, in the south portion of the front, was under the orders of the Austro-Hungarian Army Higher Command (Teschen). Each section had a breadth of 400 km. The Austro-Hungarian divs. were on an average 14 batts. strong, the Germans only nine. The inferior rifle-shooting of the Germans was abundantly compensated by their superior equipment in artillery and fighting material of all sorts. The entire rifle strength of the forces of the Central Powers on this front amounted at this time to rather more than a million. It would be safe to estimate the Russian front at double that strength. The Russian Higher Command, controlled since autumn 1915 nominally by the Tsar but actually by his chief-of-staff, Gen. Alexeiev, could draw on its drafting reserve to the fullest extent. In the spring of 1916 the regiments, in spite of the gigantic losses suffered in the last campaign, had been replenished for some time. Immediately behind the army front were enormous masses of reserves, and all the recruiting depots were full. Half of the world's munition factories were straining to supply equipment for the Tsar's armies. A number of En-

tente officers were instructing Russians in the western methods of attack. Along with all this the greatest efforts were made to raise the soldiers' *moral*.

By March 1916 about 130 inf. divs. and 40 cav. divs. stood on the Russian front, the inf. divs. consisting of 16 batts.—almost double the number of the German. This did not include the draft formations standing in readiness immediately behind the fighting reserve. The rifle strength of the front might safely be estimated at 2½ millions. Her allies might well hope that Russia, in spite of her defeat in 1915, would come up to expectations in the general offensive planned for the summer.

Battle of Lake Narocz (Naroch), March 18–29 1916.—The German attack on Verdun in Feb. 1916 brought the Russians into action earlier than was expected. Like Italy, who was now making her fifth attack on the Isonzo, the empire of the Tsar was expected to lose no time in doing its utmost for the relief of France. Russia had already transferred her centre of gravity to the area N. of the Pripet before this demand reached the Higher Command. On this section, that is, opposite the German front, were 80 out of 130 Russian divisions. Since the beginning of March Hindenburg's general staff (Kovno) had located a concentration of Russian troops at Smorgon, Dvinsk (Düna-burg) and Jakobstadt. On the other hand, the attack of the II. Russian Army under Gen. Smirnov on both sides of the Narocz lake on March 18 took the Germans somewhat by surprise. After a preliminary bombardment, such as had not yet been seen on the eastern front, this army flung itself upon the German XXI. Army Corps commanded by Gen. von Hutier. It was assumed from orders of the supreme commander of the Russian west front (Gen. Ewerth), which were captured by the Germans, that the Russians meant more by this attack than a mere relief offensive. While Gen. Litvinov's I. and Gen. Plehve's V. Armies were holding the weak German forces occupying the trenches at Widsy, Dvinsk, and Jakobstadt, Smirnov was to force a way through in the direction of Vilna–Kovno and then to wheel northwards and so drive the German wing to the sea.

The " Narocz Offensive " led at first to considerable successes for the Russians. The attack delivered between the Narocz and Wiszniew lakes by Gen. Balujyev with 4 army corps pressed the weak German forces backwards some miles between March 18 and 21. Though the groups attacking farther to the N. were not so fortunate, the Russians might yet hope for success. Then, to the rescue of the Germans, came a sudden thaw. This, indeed, increased the difficulty of bringing up the reserves which they had scraped together so painfully, but incomparably worse was the plight of the attackers in this melting of snow and ice. Their second and culminating attack on March 26, according to the German reports, was choked literally " in mud and blood." Towards the end of March the Russian spring offensive of 1916 died away, without ever getting beyond the local success on Lake Narocz. Their losses were estimated by the Germans at 150,000 men, while the Germans sacrificed not more than 15,000.

On April 28 1916 the troops of the German X. Army under Gen. von Eichhorn snatched from the Russians the greater part of that tract of country which they had captured during the March battles in the confined area of Lake Narocz.

The Luck (Lutsk) Campaign, Summer of 1916.—At the conference held on March 18 1916 the Allies had fixed July 1 for the opening of the great general offensive on all fronts. For this the Russian Supreme Command was now making ready. By the end of May all their preparations pointed to the probability of their decisive attack again being made N. of the Pripet marshes, and again on the German front. Of the 130 Russian divs., comprising over 2½ million rifles, as to which the Austro-Hungarian and the German intelligence service had accurate reports, 74 to 77—or less than two-thirds—were in the northern section. On the side of the Central Powers there were at the same time on the eastern front 83½ inf. divs. and about 20 cav. divs., each cav. div. counting almost as many rifles as one regt. of inf., and often fewer. Altogether these amounted to 600,000 fighting men for the Germans and the same number for the Austro-Hungarians. The distribution of forces was the same as in the beginning of March.

In the middle of May the Austro-Hungarian offensive against Italy had started, meeting at the beginning with great success. Once more the Russians were faced with the necessity of relieving their hard-pressed allies, and at least preventing any further transference of Austro-Hungarian fighting forces to the Italian front. Now the preparations for the Russian attack were not yet complete. Also it was evident that active relief to the Italians could only ensue from an attack, not on the German, but on the Austro-Hungarian eastern front—that is, between Pinsk and the Bessarabian Pruth. The Russian Supreme Command were not easily induced to depart from their original plans or to attack prematurely before July 1. In the end, however, they had to yield to the pressure of the Allies. Gen. Brussilov, supreme commander of the Russian " south-west front," with the Quartermaster-General, Gen. Dietrich, as the real source of energy at his side, received the order to advance to the attack from Rovno down to Bessarabia. The very first assault, made with attack groups that had been got together at haphazard, brought Brussilov great and unexpected success on both wings in the battles of Luck and Ocna, although the defenders were not unfavourably situated as regards numbers. Thereupon the Russian Supreme Command decided to refrain from the great attack on the German front altogether and transfer the centre of gravity of their operations to the southern section. The advances on the Russian side during the next three months, at Riga, Jakobstadt, Dvinsk, Smorgon and Lake Narocz, were therefore undertaken only at odd moments, without any successes worth mentioning, and must be treated simply as demonstrations. But meanwhile Brussilov had snatched from the Central Powers large portions of Volhynia and East Galicia and the Bukovina.

Battles of Baranovichi (Baranowicze).—On the other hand, the objective of the Russian Supreme Command in the three battles at Baranovichi had a close connection with the operations at Luck. In the first battle, on June 13 and 14 1916, the attacks led by Gens. Ragosa and Lesch failed completely. Gen. Woyrsch maintained the upper hand over the Russian grenadiers with his Silesian Landwehr. The Germans lost 150 men, the Russians 7,000. In the second battle, on July 2–14, the Russians put in 16 of their divs. against the 2½ German and 2 Austro-Hungarian divs. holding the section Gorodishche (Horodyszcze)–Baranovichi. The Russian main blow fell on the Austro-Hungarian XII. Corps under Gen. von Henriquez, and forced it back to the second position. German battalions were hastily scraped together to reënforce their hard-pressed allies. There were critical hours and critical days. But on the last two days of the battle the greater part of the ground captured by the Russians was torn from them again. East of Baranovichi Gen. Ragosa's troops were fated to achieve only unimportant local successes. The defenders lost—in dead, wounded and missing—180 officers and 8,000 men; the attacking Russians many times this number.

For the third time the battle of Baranovichi blazed forth on July 25 1916, this time as an introduction to the great Russian general attack N.W. of Luck. Once more the Russians flung themselves against the Gorodishche section, but were driven back by the Germans after a fierce three days' fight.

Operations in the Summer of 1916.—The Russian offensive in the beginning of June 1916 brought the attention of the Central Powers with a jerk to the eastern front, where all at once the situation had become extraordinarily tense, and the anxiety became all the greater with the reflection that the results in the other theatres of war had not come up to their expectations. The Verdun undertaking had cost the Germans heavy sacrifices without making them masters of the fortress, and it was but a small consolation to know that the French had bled even more than they. On the Somme an English-French attacking force of prodigious size and fighting strength was massing itself. In the Venetian mountains at Asiago, the Austro-Hungarian corps, though it was still attacking, had lost much of its momentum since May 25. A pause in the fighting at the end of that month

had given the Italians an opportunity of flinging powerful masses of troops on to the hard-pressed mountain front, thus averting catastrophe for the time being.

The turn of events in the east called for new decisions, and a few days after Luck the two chiefs of the General Staffs of the Central Powers met in Berlin to form these decisions. The idea of leaving the eastern front—in Falkenhayn's words—"to look after itself" was, it may be assumed, only theoretically discussed. Neither did such resolutions come under consideration, either then or later, as those executed in 1914 by the Central Powers when they shook off the enemy by one mighty move backwards and thus again deprived him of the initiative. The scarcity of food alone, under which the peoples of the Central Powers were already beginning to suffer heavily, made it imperative to cling to every foot of fruitful soil in Volhynia or East Galicia at all costs. On the other hand, the situation was so grave on all other fronts that for the moment any assistance proposed for the eastern front must be of a modest order. The commanders of the armies fighting against Russia indeed attempted, even within their own areas, to keep their forces together for use as units rather than to use them to fill up gaps. Gen. von Linsingen, for example, made frequent efforts in the area of his own group of armies at Luck to concentrate strong forces for counter-attack. But the strength of these attack-groups, in most cases, very soon exhausted itself against the numerical superiority of the enemy. Similar attempts were made several times in East Galicia and also in the Carpathians. Mention should be made in this connexion of a plan formed in the beginning of July 1916 to form a XII. Army out of the German and Austro-Hungarian troops in East Galicia and to attack with it on both sides of the Dniester. This idea certainly promised success; but the divs. selected for the purpose were, in view of the new increase of the Russian attacks, in most cases diverted to some particular danger-spot on the wide-spreading defence front; and the construction of the XII. Army, together with the task to be entrusted to it, had to be given up. There was nothing for it but to persist in the method practised since the middle of June, and contest every inch of ground in dogged local defence-battles. And even this mode of warfare was conditional on a considerable expenditure of force. Between the beginning of June and the end of Aug. about 17 German divs. had to be brought over from France and 8 to 10 Austro-Hungarian divs. from Italy. In addition, the front to the N. of the Pripet transferred a large portion of its regts. and divs. to the southern section, receiving in exchange only worn-out troops.

Since the beginning of July 1916 the Russians had also withdrawn strong forces from Kuropatkin's and Ewerth's fronts to add them to Brussilov's. Finally, at the beginning of Sept. the area S. of the Pripet, with 71 divs., had 20 divs. more than the northern section. The attacks during the summer offensive of 1916 cost the Russians enormous bloodshed. Great as were the results, the sacrifices far outweighed them. The Russian Supreme Command remained true to the methods practised in the Carpathians. It is quite impossible to point to any great conception underlying the operations of the Russian Command in these battles. They worked on purely local considerations and prospects, and often did not even make use of these, as for instance immediately after the first great blows delivered at Luck, when they gave their opponents time to close a gap of 50 km. which had been made. More than once did the Russian Supreme Command let slip an opportunity of a mortal blow.

Creation of the "Hindenburg Front."—The great crisis on the eastern front, lasting several months, reacted strongly on the relations between the armies of the Central Powers. The Austro-Hungarian troops had, from the very first Russian attacks, shown considerably less power of resistance than the German. The Austro-Hungarian armies fighting at Luck and Ocna had, within a few days, left a quarter of a million prisoners in the enemy's hands. Even in peace-time the conditions in the polyglot Dual Monarchy were less favourable by far than those in the German Empire for a display of military power, and the unexpectedly long duration of the war increased the difficulties enormously. It should also be remembered that in the first year of the war the Austro-Hungarian military forces had had a considerably larger drain on their men than the German. At the end of 1915 only a small remnant of the forces deployed at the beginning of the war was left at the front. The rest were dead, wounded or prisoners. In the quiet period before the Russian summer offensive of 1916 the training of the drafting reserve was certainly better organized than in the first year, when recruits had on occasion to be sent to the front after a month's training. But between the young, systematically trained peace-time forces, full of heroic self-sacrifice, with which the war started, and the Landsturm troops of the later campaigning years, some of them physically and morally unsound to begin with and many of them far too old, there could be no comparison. This was particularly the case with a considerable proportion of the Slav and Rumanian forces, on whom the great national crisis could not act as a spur but rather as the reverse, as was not infrequently proved. Under these difficult conditions the lack of good regular officers was most keenly felt. The flower of these had been left on the battle-fields of 1914.

In consequence of the internal weakening of the Austro-Hungarian army in the east—which was not noticeable in anything approaching the same degree where the army was opposed to its "hereditary enemy," Italy—a rule was made that on every point of the battle-front where the Russians were using great pressure German units should be flung in. In this way, from the beginning of July, the whole Austro-Hungarian section was interspersed with German troops. This system of "stay-boning," as it was sarcastically called, naturally brought with it a powerful increase of German influence in the combined army. It also happened that the Austrian leading provoked frequent criticism on the part of the German commanders. Immediately after the first Russian assault at Luck, for instance, the commander of the IV. Army, Archduke Joseph Ferdinand, was relieved of his command on the explicit demand of the German General Staff. Added to this, between the new commander and his Austrian subordinate commanders intermediate posts were interposed and filled by German generals, who alone exercised direct power of command over the troops. As the number of German forces on the Austro-Hungarian front increased, the ambition of the Germans to get the principal commands into their own hands became more and more evident. Immediately after the beginning of the Russian offensive, the area commanded by the German Gen. Linsingen, which began on the Pripet, was extended to the boundary of Galicia. At the same time Falkenhayn proposed to entrust Field-Marshal Mackensen, who was in Bulgaria, with the supreme command of all the allied troops fighting S. of the Pripet. Conrad von Hötzendorff was opposed to this arrangement, but offered to confer on Mackensen the command of a group of armies in East Galicia. This Falkenhayn declined.

In July Falkenhayn made the proposal to recall Field-Marshal von Hindenburg from Kovno and appoint him supreme commander between the Pripet and the Dniester. To this plan Conrad agreed, though without seeing any particular meaning in it. As a matter of fact Falkenhayn's proposal was made more on personal than on practical grounds. The chief of the German General Staff had from the start few friends but many enemies. Since the failure of the attack on Verdun, Emperor William had begun to be besieged with complaints against the man who had his particular confidence. The Imperial Chancellor also urged that Falkenhayn should be replaced by Hindenburg, with a vigour quite unusual with him. The summer battle made the situation more acute. A depression fell over Germany, the army lost faith in the Supreme Command, and louder and louder became the clamour for Hindenburg.

Falkenhayn, though realizing that his relations with Hindenburg and Ludendorff had been somewhat strained for more than a year past, felt obliged to fall in with the general opinion. He therefore proposed—assuredly more or less against his inward conviction—that Hindenburg should receive the appointment alluded to, that of supreme commander from the Pripet to the

tente officers were instructing Russians in the western methods of attack. Along with all this the greatest efforts were made to raise the soldiers' *moral*.

By March 1916 about 130 inf. divs. and 40 cav. divs. stood on the Russian front, the inf. divs. consisting of 16 batts.—almost double the number of the German. This did not include the draft formations standing in readiness immediately behind the fighting reserve. The rifle strength of the front might safely be estimated at 2½ millions. Her allies might well hope that Russia, in spite of her defeat in 1915, would come up to expectations in the general offensive planned for the summer.

Battle of Lake Narocz (Naroch), March 18–29 1916.—The German attack on Verdun in Feb. 1916 brought the Russians into action earlier than was expected. Like Italy, who was now making her fifth attack on the Isonzo, the empire of the Tsar was expected to lose no time in doing its utmost for the relief of France. Russia had already transferred her centre of gravity to the area N. of the Pripet before this demand reached the Higher Command. On this section, that is, opposite the German front, were 80 out of 130 Russian divisions. Since the beginning of March Hindenburg's general staff (Kovno) had located a concentration of Russian troops at Smorgon, Dvinsk (Dünaburg) and Jakobstadt. On the other hand, the attack of the II. Russian Army under Gen. Smirnov on both sides of the Narocz lake on March 18 took the Germans somewhat by surprise. After a preliminary bombardment, such as had not yet been seen on the eastern front, this army flung itself upon the German XXI. Army Corps commanded by Gen. von Hutier. It was assumed from orders of the supreme commander of the Russian west front (Gen. Ewerth), which were captured by the Germans, that the Russians meant more by this attack than a mere relief offensive. While Gen. Litvinov's I. and Gen. Plehve's V. Armies were holding the weak German forces occupying the trenches at Widsy, Dvinsk, and Jakobstadt, Smirnov was to force a way through in the direction of Vilna-Kovno and then to wheel northwards and so drive the German wing to the sea.

The "Narocz Offensive" led at first to considerable successes for the Russians. The attack delivered between the Narocz and Wiszniew lakes by Gen. Balujyev with 4 army corps pressed the weak German forces backwards some miles between March 18 and 21. Though the groups attacking farther to the N. were not so fortunate, the Russians might yet hope for success. Then, to the rescue of the Germans, came a sudden thaw. This, indeed, increased the difficulty of bringing up the reserves which they had scraped together so painfully, but incomparably worse was the plight of the attackers in this melting of snow and ice. Their second and culminating attack on March 26, according to the German reports, was choked literally "in mud and blood." Towards the end of March the Russian spring offensive of 1916 died away, without ever getting beyond the local success on Lake Narocz. Their losses were estimated by the Germans at 150,000 men, while the Germans sacrificed not more than 15,000.

On April 28 1916 the troops of the German X. Army under Gen. von Eichhorn snatched from the Russians the greater part of that tract of country which they had captured during the March battles in the confined area of Lake Narocz.

The Luck (Lutsk) Campaign, Summer of 1916.—At the conference held on March 18 1916 the Allies had fixed July 1 for the opening of the great general offensive on all fronts. For this the Russian Supreme Command was now making ready. By the end of May all their preparations pointed to the probability of their decisive attack again being made N. of the Pripet marshes, and again on the German front. Of the 130 Russian divs., comprising over 2½ million rifles, as to which the Austro-Hungarian and the German intelligence service had accurate reports, 74 to 77—or less than two-thirds—were in the northern section. On the side of the Central Powers there were at the same time on the eastern front 83½ inf. divs. and about 20 cav. divs., each cav. div. counting almost as many rifles as one regt. of inf., and often fewer. Altogether these amounted to 600,000 fighting men for the Germans and the same number for the Austro-Hungarians. The distribution of forces was the same as in the beginning of March.

In the middle of May the Austro-Hungarian offensive against Italy had started, meeting at the beginning with great success. Once more the Russians were faced with the necessity of relieving their hard-pressed allies, and at least preventing any further transference of Austro-Hungarian fighting forces to the Italian front. Now the preparations for the Russian attack were not yet complete. Also it was evident that active relief to the Italians could only ensue from an attack, not on the German, but on the Austro-Hungarian eastern front—that is, between Pinsk and the Bessarabian Pruth. The Russian Supreme Command were not easily induced to depart from their original plans or to attack prematurely before July 1. In the end, however, they had to yield to the pressure of the Allies. Gen. Brussilov, supreme commander of the Russian "south-west front," with the Quartermaster-General, Gen. The very first assault, made with attack groups that had been got together at haphazard, brought Brussilov great and unexpected success on both wings in the battles of Luck and Ocna, although the defenders were not unfavourably situated as regards numbers. Thereupon the Russian Supreme Command decided to refrain from the great attack on the German front altogether and transfer the centre of gravity of their operations to the southern section. The advances on the Russian side during the next three months, at Riga, Jakobstadt, Dvinsk, Smorgon and Lake Narocz, were therefore undertaken only at odd moments, without any successes worth mentioning, and must be treated simply as demonstrations. But meanwhile Brussilov had snatched from the Central Powers large portions of Volhynia and East Galicia and the Bukovina.

Battles of Baranovichi (Baranowicze).—On the other hand, the objective of the Russian Supreme Command in the three battles at Baranovichi had a close connection with the operations at Luck. In the first battle, on June 13 and 14 1916, the attacks led by Gens. Ragosa and Lesch failed completely. Gen. Woyrsch maintained the upper hand over the Russian grenadiers with his Silesian Landwehr. The Germans lost 150 men, the Russians 7,000. In the second battle, on July 2–14, the Russians put in 16 of their divs. against the 2½ German and 2 Austro-Hungarian divs. holding the section Gorodishche (Horodyszcze)-Baranovichi. The Russian main blow fell on the Austro-Hungarian XII. Corps under Gen. von Henriquez, and forced it back to the second position. German battalions were hastily scraped together to reënforce their hard-pressed allies. There were critical hours and critical days. But on the last two days of the battle the greater part of the ground captured by the Russians was torn from them again. East of Baranovichi Gen. Ragosa's troops were fated to achieve only unimportant local successes. The defenders lost—in dead, wounded and missing—180 officers and 8,000 men; the attacking Russians many times this number.

For the third time the battle of Baranovichi blazed forth on July 25 1916, this time as an introduction to the great Russian general attack N.W. of Luck. Once more the Russians flung themselves against the Gorodishche section, but were driven back by the Germans after a fierce three days' fight.

Operations in the Summer of 1916.—The Russian offensive in the beginning of June 1916 brought the attention of the Central Powers with a jerk to the eastern front, where all at once the situation had become extraordinarily tense, and the anxiety became all the greater with the reflection that the results in the other theatres of war had not come up to their expectations. The Verdun undertaking had cost the Germans heavy sacrifices without making them masters of the fortress, and it was but a small consolation to know that the French had bled even more than they. On the Somme an English-French attacking force of prodigious size and fighting strength was massing itself. In the Venetian mountains at Asiago, the Austro-Hungarian corps, though it was still attacking, had lost much of its momentum since May 25. A pause in the fighting at the end of that month

to this step had not been easy to obtain. Meanwhile the war fell practically fast asleep, as was natural. On April 4 1917 the troops under Prince Leopold of Bavaria, who had taken over the eastern front between Riga and the Carpathians from Hindenburg in the autumn of the previous year, captured the small Russian bridgehead, Stocbod, at Tobol in Polyesie, by a *coup de main*, on which occasion the Russians gave themselves up as prisoners in swarms. On the political circles of the Imperial Powers this action produced a most disturbing impression, and the troops were now ordered to suspend all hostilities against the Russians unless they should provoke them.

In preparing the line to be taken with regard to propaganda in the trenches, the Austro-Hungarian Government would have liked to make use of the Petrograd catch-words, "Peace without annexation or indemnity" and "the right of nations to self-determination." But the dominating influence of the German Supreme War Command, which was not prepared to give up its Balkan aspirations in a hurry, prevented this. Nevertheless it was hoped, especially when the Workmen's and Soldiers' Councils became a stronger political factor in Petrograd in the beginning of May, that a way might be found to force Kerensky's Government to agree to an armistice and consent to open peace negotiations. This hope was to prove deceptive. When at last an envoy from Prince Leopold of Bavaria succeeded in penetrating beyond the Russian trenches to Gen. Dragomirov, commander of one of the armies on the north front, he was met with an absolutely unequivocal refusal. Meanwhile, at numerous points of the front, a local truce had been declared. But in June a remarkable change was noticeable on the Russian side. Kerensky, relying on Gen. Brussilov and numerous Entente military missions, succeeded gradually in converting a considerable portion of the army to the idea of carrying on with the war to make the world "safe for democracy," and in restoring their fighting spirit.

Battles in Galicia and the Bukovina, Summer of 1917.—By the end of July the Army Commands of the Central Empires had reason enough to count upon a revival of the war in the east. Indeed, the Russian Supreme Command, apart from the concentration of troops at Riga, Dvinsk and Kriewo[1] in the Courland-Lithuania section, had assembled two powerful attack groups in East Galicia. The one, a division strong, stood N.E. of Brzezany opposite the Austro-Hungarian II. Army (Böhm-Ermolli); the other, 15 inf. and 2 cav. divs. strong, was piling itself up adjacent to the first and opposite the German Southern Army under Gen. von Bothmer.[2] These powerful attack-masses were charged to overthrow the enemy and to take Lemberg.

The Army Higher Commands of the Central Powers did not look on idly at the Russian preparations for attack. By June 27 the German Emperor, in concert with the Austro-Hungarian General Staff and Prince Leopold of Bavaria, was ready with the order to counter-attack in case of a Russian attack in East Galicia, and to throw back the enemy beyond the frontier of the Austrian Empire. Besides the allied troops already on the spot, 5 divs. could be brought up from the west and 3 to 4 divs. from that section of the eastern front which was not threatened.

Battle of Brzezany, July 1–6.—The anticipated Russian attack was launched on July 1 1917 on both sides of Brzezany. The Western Powers had supplied their Russian allies with artillery, munitions and war supplies of all sorts in abundance. The battle of Brzezany lasted six days with only slight interruption. The Russians made only slight gains in fighting the German Southern Army E. and S. of Brzezany, and these were for the most part wrested from them again. N.E. of Brzezany, in the village of Koniuchy, they were more successful. Here they had brought into the fight a Czechoslovak brigade against Austrian battalions of Slavonic speech, large sections of which surrendered, with the result that the Austro-Hungarian line was driven back

[1] At Kriewo the Russians actually attacked with 10 inf. divs. on July 21 and 22, forcing back the German front 2 km. deep along 4 km. of front.

[2] The designations "Austro-Hungarian II. Army," "German Southern Army," etc., refer only to command and staff. The troops were thoroughly mixed on the whole of the eastern front.

some 4 or 5 km. on a front of 10 km. On the evening of the second day of the battle, however, the Russian blow was countered by the German troops. Since, to the immediate N. of the battle-field and N.W. of Zborów, the first echelons of the German divs. rolling up for the counter-attack had arrived, and the Russian attack had so lost its force, Prince Leopold of Bavaria now supposed the danger to be averted.

Far more unpleasant was the effect upon the command of the heavy set-back to the Austro-Hungarian III. Army under Gen. von Tersztyanszky at Stanislau only a few days later. Here Gen. Kornilov, the ambitious commander of the Russian VIII. Army, had advanced to the attack at 7 A.M. with an attack-group thrown together anyhow. On the following day he already held in his hand the key to the enemy's position—the Jutrena Gora height dominating Stanislau. Tersztyanszky hoped at first to have to withdraw the north wing only, but the Russians pushed the Austro-Hungarian regiments back so vigorously that by July 11 the whole of the III. Army had to be withdrawn behind the Lomnica. The town of Stryj, and the East Galician petroleum district, Drohobycz-Boryslaw, on the possession of which the continuance of the submarine war very largely depended, were in the utmost danger, and Prince Leopold of Bavaria was forced to let 3 inf. and 1 cav. divs. of the units rolling up for the counter-blow be diverted to the III. Army.

When the Russians again attacked at Kalisz and made progress there, Prince Leopold and his chief of the General Staff, Col. Hoffmann, were confronted with the difficulty of deciding whether in the given case the counter-blow at Zborów, already being prepared, should be given up, and help sent in haste to the sore-pressed Gen. von Tersztyanszky. The Prince resolved to adhere to the original plan. He proved to be right. The attacks of Kornilov's troops lost their sting as rapidly as those delivered at Brzezany by the Russian VII. Army. Aided by German reënforcements, Gen. Kritek, who relieved Tersztyanszky in the command of the III. Army, was able by the 16th to prove his troops' newly established powers of resistance in counter-attacks at Kalisz.

Meanwhile, between the upper Sereth and the railway line between Lemberg and Tarnopol, immediately W. of Zborów, 8 inf. divs. (including the I. and II. Guard Divs.) and one combined cavalry div. were deployed for the counter-blow along 25 km. of front behind the divisions of position. The German Gen. von Eben was in command on the battle-field. The intention was on the first day to make a hole in an easterly direction in the south wing of the Russian VIII. Army which stood opposite, and then to wheel to the S.E. and grip the massed Russians of the VII. Army standing on either side of Brzezany, in the N. flank and in rear.

The Battle of Zborów.—This idea underlying the battle of Zborów (July 19–26 1917) was carried out according to plan. Early on the 19th the German and Austro-Hungarian forces drove the Russians from the Zlota Gora height, N. of Zborów, under the eyes of Prince Leopold of Bavaria. Simultaneously the German Guard, reinforced by a line division, broke through the Russian front immediately S. of the Sereth. Only in places did the Russians offer resistance. Their retreat frequently degenerated into precipitate flight. While the Guard Div. in the following days drove down on Tarnopol, the divs. brought forward from the 2nd line pressed after in a S.E. direction. The Russian masses at Brzezany were soon swept into the general retreat. By the 22nd the German Southern Army was able to take up the pursuit, also from the N. wing. On the 23rd the III. Army followed S. of the Dniester, and was able on the next day, after several fights, to push out to beyond its old positions at Stanislau. On the 25th the German Guard took Tarnopol in presence of the German Emperor, and on the 26th the heights to the E. of it, thus assuring an adequate protection to the S.E. blow by the other allied forces. The S. wing of the II. Army was already beyond Trembowla, and the Southern Army beyond Buczacz. They had rapidly broken the Russian resistance.

A few days after the defeat of Zborów the Russian command passed out of Brussilov's hands into those of Kornilov. The

Russian General Staff reports of those days give a tragic picture of the condition of the VII. Army and the S. wing of the VIII. Army at that time. It was clearly out of the question to maintain a hold on East Galician soil in this area. The decision was therefore made at Mohilev to withdraw the VII. Army and those parts of the VIII. Army pursued by the enemy behind the river Zbrucz on the frontier.

Capture of Czernowitz by the Austrians.—More cheering were the reports received by the Russian Supreme Command from the VIII. Army now commanded by Cheremissov, which was retiring S. of the Dniester. This army could, with some hope of success, be charged to hold Czernowitz and as much as possible of the Bukovina. Further relief was expected from the results of the Russian-Rumanian attack in the valley of the upper Susita in Rumania, which had commenced on July 23 and was accompanied by demonstrations along the whole Transylvanian east front. This attack had really succeeded by July 27 in forcing back the numerically very weak defenders to a not inconsiderable distance. But the fate of the Bukovina was nevertheless sealed. Between the Dniester and the Carpathians Cheremissov's troops several times put up a good resistance; in fact, the Austro-Hungarian III. and VII. Armies (the latter under Gen. von Kövess) had even to deliver counter-blows. But on the morning of Aug. 3 1917 the Russians, threatened on the N. and the S., had to surrender Czernowitz, and soon to retire from the Bukovina into the frontier area. The Austro-Hungarian III. Army pursued between the Pruth and the Dniester and the VII. S. of the Bukovina.

East Galicia had also been swept clean of the Russians, apart from the area N.E. of Tarnopol which had remained untouched by the offensive. Advanced detachments of the German Southern Army had set foot on Russian soil on the middle and lower Zbrucz. But here the soldierly characteristics of the Russian people, which had survived even the unnerving influence of the revolution, came to the fore again. The Russians not only cleared the E. bank of the Zbrucz, but roused themselves in an amazing manner to renewed resistance E. of Czernowitz and in the southern part of the Bukovina. It was undoubtedly to their advantage that the enemy in his rapid advance had come dangerously far away from his railways. The Austro-Hungarian III. Army at Czernowitz for instance was 120 km. removed from its main detraining station lying W. of Stanislau. This was particularly serious in view of the meagre means of transport supplied to the Austro-Hungarian troops. Had the armies been crossing a less fertile area the pace of the offensive must soon have slowed down very considerably. As it was the troops could subsist largely on the resources of the country and the rich booty left behind by the Russians. But now, on the frontiers of East Galicia and the Bukovina, the advance of the Imperial forces was arrested.

The Battle of Marasesti (Marashesht̆i).—For some weeks past the Allied Higher Commands had been considering the idea of combining with the East Galicia offensive an attack on the Rumanians in Moldavia, which should drive them behind the Pruth, thus gaining a particularly useful defence section in which troops could be economized. Accordingly, on Aug. 6 1917 Mackensen advanced to the offensive against the Rumanians N. of Focshani. The battle of Marasesti ended unfortunately for the forces of the Central Powers. In view of this, and of the difficulty of obtaining fresh drafts in the Bukovina, the Central Powers abandoned the idea of occupying Moldavia for the present, and dropped it completely when, at the end of Aug. and the beginning of Sept. the Isonzo battle led to the combined Oct. offensive against Italy. Ludendorff lays stress, in his memoirs, on his own reluctance to give up the Rumanian campaign.

In the Bukovina and on the Transylvanian-Rumanian front minor operations lasted until the middle of September. Local attacks and counter-assaults were distributed on both sides. Then gradually the fighting died down.

German Capture of Riga.—Meanwhile, in the extreme N., the Germans had won a fresh victory over the Russians. During the second half of Aug. they had been quietly preparing to capture Riga. By order of Gen. von Hutier, supreme commander of the German VIII. Army, 6 divs. were placed in readiness for crossing the Dvina opposite Üxküll, to the S.E. of Riga. Other forces were to follow. Altogether there were 14 divs. available for the undertaking, including the Guard and other units brought from East Galicia.

The crossing at Üxküll was carried out most punctually on Sept. 1 1917. By now 3 bridges had been built. The Russian XII. Army (Parski), 20 inf. divs. strong, made only a slight resistance, and by the 2nd had evacuated all the positions S. of Riga. On the following day the 2nd Guard Div. and the 1st Res. Div. were able to enter the ancient Baltic trading-centre, the one from the east, the other from the west. The Russians now evacuated the whole N. bank of the Dvina up to beyond Friedrichstadt. On the 4th the German infantry reached Hinzenberg railway station, 40 km. N.E. of Riga. The permanent position was now formed along a line drawn from Üxküll to Hinzenberg and thence westwards to the sea. Only the German cavalry now pursued the enemy, who first came to a stand 20 to 40 km. E. and N. of the German line.

The occupation of Riga needed to be supplemented for the Germans by the capture of the Baltic islands, Ösel, Moon and Dagö, and this was duly achieved in the middle of October. For the first time in the war, on the side of the Central Powers, the navy was present in some strength to assist in the operations of the land army. The landing corps consisted of the German 42d Inf. Div. and the Cycle Bde., and was commanded by Gen. von Kathen. The spot selected for the landing was Tagga Bay on the N.W. corner of Ösel Island. While Adml. Erhard Schmid's German squadron penetrated through the Domesnäs straits, after silencing the coast batteries, the torpedo boats went round Ösel in a northerly direction, in order to bring their guns to bear on the mole connecting Ösel with Moon and to cut off the retreat of the Russian troops on Ösel. From the N. they were to press on into the Moonsund. On Oct. 13 the German troops landed in Tagga Bay. The enemy, about one div. strong, tried to effect their escape, some southwards to the Sworbe Peninsula, others over the mole to the island of Moon. By evening on Oct. 16 the whole of Ösel was in possession of Gen. Kathen. Ten thousand Russians were taken prisoners, among them one divisional and three brigade staffs. On the 18th Lt.-Gen. von Estorff, advancing over the mole, occupied the island of Moon, and on the 21st Dagö had also been taken by the Germans. In the waters of Moon it came to fighting engagements between German and Russian ships, in the course of which the Russian battleship "Slava" was set on fire.

The Armistice.—On Nov. 7 the Bolshevist Revolution broke out in Russia. On Nov. 9 the congress of the "Workmen's and Soldiers' Council," meeting at Petrograd, issued its proclamation of peace "to all." In vain did Kerensky and Kornilov attempt to give matters a different turn. An army corps sent by them against Petrograd on Nov. 12 was defeated at Tsarkoye Selo. On the 20th the Council of People's Commissaries gave instructions to the new Russian Supreme Commander, Dukhonin, to offer an armistice to all the belligerents. As Dukhonin hesitated to carry out the order he was replaced by Ensign Krylenko. On Nov. 28 the troops of the Imperial forces on the eastern front intercepted a wireless message in which Lenin and Trotsky invited the earliest possible preliminary arrangements for the armistice and peace negotiations. On Dec. 2 the armistice negotiations between the Imperial forces and Russia were begun at Brest-Litovsk, at Prince Leopold of Bavaria's headquarters. The only questions which caused serious difficulty were that of the Baltic islands, which the Russians wished the Germans to evacuate at least in part, and that of the transference of German troops to the west. On the first point the Germans refused to give way; on the second they compromised. After a formal 10 days' truce had been agreed to on Dec. 5 and the armistice had set in on the Rumanian front on the 10th, the cessation of hostilities for one month on all the Russian fronts against the Central Powers was declared on Dec. 15. On Dec. 22 the peace negotiations of Brest-Litovsk began. (E. G.-H.)

V. Rumanian Campaign, 1916–7

Operations in Transylvania and Rumania, 1916–7.—After the unexpectedly great results of the Russian summer offensive under Brussilov in 1916 the conviction gained ground in Rumania that the moment had now come for her intervention on the side of the Entente Powers. In accordance with the policy pursued since the Balkan Wars of 1912–3 of harvesting from international quarrels the greatest practicable advantage with the least possible sacrifice, Rumania now hoped to be able to realize the desire, cherished by the entire nation, for the enlargement of the kingdom by the incorporation of the districts of Austria-Hungary inhabited by her nationals.

The Austro-Hungarian Supreme Command had foreseen most clearly the intervention of Rumania, while at German Headquarters the danger did not appear so imminent; and the Hungarian Government—fearing unrest among their own population and in the hope of not destroying the last chances of maintaining peace with Rumania—avoided taking in the threatened frontier districts the measures necessary in the event of war breaking out. Thus it happened that Transylvania was quite inadequately defended from the military point of view against the Rumanian attack, and the country was hardly prepared at all as a theatre of war. On account of the pressing need for all effective units on the Russian and Italian fronts, the Austro-Hungarian Supreme Command could transfer to Transylvania in the beginning of Aug. only the seriously reduced 61st Div., the 51st Honved Div., and the 82nd Inf. Regt., troops for which an urgently needed rest had been intended. The 11th Honved Cav. Div., disentrained in Transylvania, was at once constituted the southern wing of the VII. Army. The removal of the war-worn 39th Honved Div. began in the last days of Aug. 1916. In addition there were in Transylvania, at the end of Aug., 8 newly formed inf. batts., 2 Landsturm batts., 10 communication batts., 3 mining batts. (armed coal-miners from Petrozsény), 9 "alarm" batts. (march batts. not yet fully trained), about 5,000 frontier police, 3 Landsturm squadrons and 9 field batteries, which were formed into newly created larger units whose formation was, with many changes, only completed in Oct. 1916. All the troops above mentioned, in the areas between the Hungarian frontier of the Bukovina and the Danube at Orsova, were from Aug. 13 onwards under the newly created Austro-Hungarian I. Army headquarters, under Gen. Arz von Straussenburg, at Klausenburg (Kolozsvár). Preparations were also made for the thorough destruction in the passes, of the roads and railways leading to Rumania.

At the end of July a convention was concluded at Pless between the German, Austro-Hungarian and Bulgarian Army Commands for common action in case of hostile Rumanian intervention, and to this Turkey shortly afterwards became a party. The plan of campaign was laid down in its main outlines and the contingents to be provided by the separate States agreed upon. The Germans allotted 5 to 6 inf. and 1 to 2 cav. divs., which, however, the German Supreme Command in expectation of coming events did not yet wish to place in reserve in Transylvania, as they would certainly be missed at critical points on the other battle-fronts. They therefore confined themselves for the time being to sending German construction troops to strengthen the existing railway lines in Transylvania, S.E. Hungary and northern Bulgaria for the advance of larger bodies of troops. The German detachment under Kauffmann, already placed in northern Bulgaria with a view to the creation of a German-Bulgar-Turkish army on the Dobruja frontier, was reënforced, and had heavy artillery, mine-throwers and flying formations.

Bulgaria placed on the Dobruja frontier the III. Army, commanded by Gen. Toshev, consisting of the 1st, 4th and one-third of the 6th Inf. Divs.,[1] one cav. div., the garrison of Varna, and a part of the Kauffmann detachment, while the Danube was guarded from Tekija (opposite Orsova) to the mouth of the Vid by the Bulgarian 12th Inf. Div., and from there eastwards as far as Ruschuk by the German Kauffmann detachment. At Sistova there was a heavy Austro-Hungarian bridging train with its complement of men, some heavy batteries, and the Austro-Hungarian Danube flotilla. The supreme command over all the troops in Bulgaria for operations against Rumania was exercised by Mackensen, with headquarters at Tirnovo.

It was considered most probable that Rumania, when she struck, would begin by invading Transylvania, in order to gain possession of the country and to use it as a base from which completely to shatter the Carpathian front, which the Austro-Hungarians, as it was, were only maintaining with difficulty, while comparatively weak forces only would be employed against Bulgaria. On this assumption it was proposed to surprise and overrun the Rumanian positions in the Dobruja with the German-Bulgar-Turkish forces, in order to penetrate to the narrowest part of the district between the Danube and the Black Sea. The strongest possible forces would then be collected, and held ready at Sistova, where the heavy Danube bridging train was already placed, for a forward push in the direction of Bucharest. In Transylvania the Austro-Hungarian forces were to hold up the Rumanians in the mountains on the frontier if possible, but at latest on the position prepared on the upper Maros and the Little Kukülló (Kleine Kokel), until the attacking troops being concentrated meanwhile could be marched up. These, and Mackensen's troops to be held ready at Sistova, would then proceed to the reconquest of Transylvania and the overthrow of Rumania. In this case the unusual happened, and the actual operations in their main lines were successfully executed as had been proposed in the discussion of war plans at Pless.

Rumania had pushed forward her mobilization, and by continuously reënforcing the troops on the Transylvanian border had so nearly completed their concentration that operations could begin immediately on the declaration of war, which was handed in at 9 P.M. on Aug. 27. It was intended first to conquer Transylvania. For this purpose strong forces were to push forward from the E. over the mountains on the frontier, and advance westwards through the valleys of the Kukülló, the N. Kukülló and the Maros. The calculations included a simultaneous push forward of the Russian front adjoining on the N., whose advance would be greatly facilitated by the offensive of the Rumanian army S. of the chain of the Carpathians stretching from Hungary into the Bukovina. The forces which penetrated the passes on the Transylvanian southern front were then to hold these by means of positions in the nature of bridgeheads, and to join the forces of the main offensive from the E. as these advanced.

On the Rumanian side expectation of an easy victory prevailed. In conformity with the plan of operations there was a concentric advance. The I. Army (Gen. Culcer), with about 4½ inf. divs. and 3 cav. bdes., and a stronger group on the E., advanced through the Roter Turm pass on Hermannstadt (Nagy Szeben), and with a weak group on the W. over the Vulkan and Szurduk passes in the line Petrozsény–Hátszeg (Hateg). The Orsova group (about one reënforced div.) on the Danube defended the left flank and the rear communications of the portions of the I. Army fighting in Transylvania against any advance from the Banat. The II. Army (Gen. Grainiceanu), with about 4 divs. and 4 cav. bdes., operated from the Törzburg to the Ojtoz pass through all the defiles leading into the Kronstadt (Brasov) basin and the Háromszék. The IV., or Northern Army (Gen. Presan), with about 4 divs. and 1 cav. bde., operated N. of the II. Army and in connexion with the Russian Carpathian front through the Uz, Gyimes, Békás and Tölgyes passes into the basins of the Csik and the Gyergyó. The III. Army (Gen. Averescu), with about 4 inf. divs. and a cav. bde., faced Bulgaria on the Dobruja frontier in strong, well-fortified positions, and was to maintain the defensive. On the stretch of the Danube from Turnu Severinu to the mouth of the Alt stood protecting troops, one div. strong. In the district S. of Bucharest the Rumanians assembled a group of several res. divs. and other new formations for disposition as reserves.

The Rumanian Invasion.—The Rumanians crossed the frontier on the night of Aug. 27–28 over all the passes into

[1] A Bulgarian inf. div. had 3 bdes. of 8 batts., *i.e.* 24 batts. in all.

Transylvania, driving back the weak Austro-Hungarian defence troops in numerous small engagements, not without suffering appreciable losses at many points. The Rumanian advance was substantially delayed by the destruction of roads and bridges effected by the Austro-Hungarian frontier troops, and especially by the bad roads of the mountain country.

By Sept. 3 the Rumanian Orsova group reached the lower course of the Cerna, and the western group of the I. Army occupied the important coal area between Urikány and Petroseny and had driven back the ineffective Landsturm and miners' battalions of the 144th Inf. Bde. over the saddle of Merisor. The eastern section of the I. Army, which had penetrated by the Roter Turm Pass, occupied positions S. of Hermannstadt, without attempting to take the town thougb it was garrisoned only by a weak Landsturm detachment. They were plainly apprehensive that hy occupying Hermannstadt they would have to extend their bridgehead-like formation heyond capacity.

The II. Rumanian Army deployed cautiously in Burgenland and in tbe Háromszék, allowing their columns to close up, and receiving fresh reënforcements. The IV. Army forced their way, in continuous fighting touch with the 61st Inf. Div., through the narrow mountain valleys, and on Sept. 3 their advanced troops reached the eastern edges of the basins of the Gyergyó and the Csik. Meanwhile the first troops sent by the Central Powers were rolling up towards Transylvania. Gen. von Arz was instructed not to use the forces assembling on both army wings to strengthen the covering troops with them as they arrived, but first to concentrate them and hold them ready for wider action. In view of the expected continuation of the Rumanian advance he directed the 39th Honved Inf. Div. and what eventually, after many changes, became the 89th Inf. Div., to the district half-way hetween Szász Régen (Reghina-Sas) and Klausenburg (Kolozsvár); the 187th Inf. Div. and 3 German cav. regts. of the 3rd Cav. Div. were to be disentrained at Maris Illye; the 1st Austro-Hungarian Cav. Div. S. of this place between Hátszeg (Hateg) and Karansches; the 1st Royal Hungarian Landsturm Hussar Bde. at Tövis. The first of the two German General Commands to arrive, Lt.-Gen. von Morgen, took over the command of the 61st and 71st Inf. Divs., the 1st Landsturm Hussar Bde., the newly arrived 39th Honved Inf. Div. and the 89th German Inf. Div., while under Lt.-Gen. von Staabs were placed the 51st Honved Inf. Div., the 187th Inf. Div., the 1st Cav. Div. and the 3rd Cav. Div., together with the covering troops at Hermannstadt, Hátszeg and Mehadia. The very slow progress of the Rumanians made it possible for the incoming divs. of the Austro-Hungarian army to move forward their disentrainment stations. Accordingly the following disentrainment arrangements were made: the 39th Honved Inf. Div. at Szász Régen, the 89th Inf. Div. at Marosujvàr, the 1st Cav. Troops Div. and the 3rd Cav. Div. (which had been united in the Schmettow Cav. Corps) at Mediasch and Elisabethstadt, the 187th Inf. Div. at Piski with a regt. intended for Hermannstadt at Alvinez.

Since the Rumanian group pushing northwards over Petroseny might endanger the transport of further reënforcements on the Maros Valley railway, the bulk of the 187th Inf. Div. was directed against Merisor, in order, in conjunction with the Austro-Hungarian 144th Inf. Bde., and strengthened by the 3 first arriving German Jäger batts. of the Alpine Corps, to throw back the Rumanian Mountain Corps over the frontier; and this task was accomplished between Sept. 14 and 22.

The Schmettow Cav. Corps, linking up on the E. with the 51st Honved Inf. Div. standing directly N. of Hermannstadt, was posted on the heights N. of the Alt as far as Fogaras (Fàgàra). The Alpine Corps, which was only one div. strong but consisted of excellent troops, equipped for mountain warfare, was disentrained with the main body at Mühlbach. The German 76th Res. Div., which was on its way, was to be assembled at Karlsburg (Gyula Fehérvár). The Austro-Hungarian 143rd Inf. Bde., which had been stationed at Hermannstadt, was moved behind the N. wing of the I. Army, and there formed into the 72nd Inf. Div. These measures, taken by the I. Army Command, on the one hand averted the menace to the Maros Valley railway at Piski, and on the other established the operative basis on which the battle of Hermannstadt was afterwards fought.

Bulgarian Offensive in the Dobruja.—Meanwhile events of far-reaching importance had taken place in the Dobruja. On Sept. 1 the III. Bulgarian Army crossed the Rumanian-Bulgarian frontier. The aim of the operation was the conquest of the Dobruja. After the capture of the bridge-heads of Turtucaia and Silistra the advance was to be made by the Cernavoda–Constantsa railway to the narrowest part of the territory lying between the Danube and the Black Sea. The fortress of Turtucaia consisted of a girdle of 15 forts on the S. bank of the Danube, which were connected by strongly built field positions. While very great care had been bestowed on the technical development of the place during the 3 years of preparation, the armament, consisting of only about 100 guns, including the field artillery, was inadequate. Artillery fire against Turtucaia began on Sept. 3; in the comprehensive attacks following on Sept. 4–5 and carried out by the 4th and sections of the 1st Bulgarian Inf. Divs. and the German detachment under Hammerstein, the bridge-head was stormed. The capture of this place by a *coup de main* was an admirable feat of arms. Only a very small portion of the garrison of the place, the 15th and 17th Rumanian Inf. Divs., which suffered heavy and bloody losses, escaped. Many soldiers were drowned in trying to swim the Danube, across which there remained no bridge. Twenty-one thousand men and 400 officers, including 3 brigade commanders, together with the whole armament, were captured.

While the remainder of the Bulgarian 1st Inf. Div. pushed forward by Akkartynlar and the 1st Cav. Div. by Kurtunar, the 2nd Bde. of the 6th Inf. Div. and the garrison of Varna attacked the Rumanian 10th Div. on the plateau N. of Dobric (Hagi-Oglu) on Sept. 4 and threw them back northwards.

In contrast to Turtucaia the bridge-head of Silistra was in a state of unpreparedness. It fell on Sept. 9 into the hands of the cavalry of the 1st Div. after a short bombardment directed against the Rumanian cavalry.

While the Bulgarian III. Army was pressing forward successfully on the whole front, the retreating Rumanians were reënforced hy the Russian Expeditionary Corps under Lt.-Gen. Zajanczkowski, which consisted of the XLVII. Corps with 3, and later 4, inf. divs., among them the 1st Serbian Div. (formed from Austro-Hungarian deserters) and the VI. Cav. Corps. The Bulgarian III. Army put their main weight in the advance in the space between the Danube and the Dobric–Medzidie (Hagi-Oglu–Megidia) line, while E. of the railway on the right wing only sections of the 1st Cav. Div. drawn from the centre of the army front operated.

On Sept. 15 the Rumanian-Russian fighting forces, which attempted to offer resistance on the line Lake Màrkeanu–Teke Deresi–Karalij-Kara Omer–Mangalia, were attacked by the Bulgars and compelled to retreat along the whole line. The III. Rumanian Army, reënforced by hurriedly-brought-up Russian and Rumanian units, prepared to fight again on the position Rasova–Copadin–Toprai Sari–Urtukiöj, which immediately protected the Cernavoda–Constantsa railway and had been partially prepared in time of peace. The attacks executed hy the Bulgarians on Sept. 19–20 did not penetrate the line this time. Instead, the III. Bulgarian Army Command were compelled to withdraw their troops some kilometres, to wait for the bringing up of munitions and the arrival of sections of the Bulgarian 12th Div., and the VI. Turkish Corps (25th and 15th Divs.). But the counter-attacks undertaken by the Rumanian eastern wing on Sept. 22 were repulsed hy the recently arrived 25th Turkish Div., and the Bulgarian-Turkish front was again established on the line N. of Amuzacia.

In the Dobruja generally operations for the time being came to a standstill.

The Liberation of Transylvania.—In Transylvania the IV. Rumanian Army advanced from the basins of the Gyergyó and the Csik through the Maros valley, then over the Görgény and Hargitta mountains, and continuously pressed hack the 61st

Inf. Div., subsequently reënforced by the 1st Landsturm Cav. Bde. It was feared that it would all too quickly reach the inner region of Transylvania, with its excellent communications. In that case it would threaten the rear of the 71st Inf. Div. which occupied positions on the W. bank of the Alt (Oltu) between Fogaras and Reps, and farther N.E. to Homorod and Okland, at the weak angle where the front of the I. Army from a direction W. to E. bent sharply from S. to N. Generally, too, it would deprive the covering troops of the possibility of protecting according to plan the picked attacking troops coming up to the front. The commander of the east front, Lt.-Gen. von Morgen, therefore, planned to make a surprise attack on the Rumanian IV. Army on its emergence from the Görgény and Hargitta mountains, using for the purpose the concentrated strength of newly arrived units. He proposed to attack either from the area N. of Szász Régen (Reghina-Sas) southwards or from the upper course of the Great and Little Kukülló valley in a N. E. direction, and by pressing on the Rumanian communications to prepare an annihilating defeat for them. This plan, however, was not approved in higher quarters; it was determined merely to strengthen the E. front by hurrying up the Austro-Hungarian 72nd Inf. Div., and a more active conduct of the defence was recommended. Both Supreme Army Commands adhered to the original plan of concentration and to the idea of striking first at the inactive enemy S. of Hermannstadt.

Before daybreak on Sept. 15 the Rumanian II. Army crossed the Alt between Fogaras and Reps in several columns, for the most part without bridges or river transport, and advanced farther N. from Baröt, through Homorod-Okland-Draas towards Katzendorf. In order to make a mobile defence possible the 71st Inf. Div. had left only weak covering troops (about 3,000 rifles) on the 60-km. front, placing the main force in readiness in the district Petek-Mehburg. The weak defence naturally had to give ground before the far superior weight of the Rumanian attacking columns. But in the afternoon the main force of the div. made a surprise attack, advancing southwards through Pálos and struck the 6th Inf. Div., marching as the most northerly column of the II. Army, in flank and rear. The surprise and confusion of the Rumanians were so great that the II. Army, which had only just crossed the Alt, ceased to advance, and remained inactive for a week.

The Rumanian IV. Army, on the other hand, continued to advance steadily, thereby compelling the command of the I. Army to support the Landsturm Cav. Bde. by 4 newly formed Bosno-Herzegovinian inf. batts., which really belonged to the unit of the 71st Inf. Div. In addition the 39th Honved Inf. Div., N.E. of Maros Vásárhely, was pushed up to the front; the 89th Inf. Div. was advanced to Maros Vásárhely, and an inf. bde. of the 37th Honved Inf. Div., coming up without artillery, was placed in readiness at Teke, N.W. of Szász Régen. The newly arrived Austro-Hungarian VI. Corps Command took over the command of the N. wing (72nd Inf. Div., half the 61st Inf. Div. and half the 37th Honved Inf. Div.), while the I. Res. Corps Command retained command of the Landsturm Hussar Bde., the 39th Honved Inf. Div., the 71st Inf. Div., supported by the 19th Mountain Bde. of the 61st Inf. Div., and the 89th Inf. Division.

At the end of Sept. the IV. Rumanian Army in the N., with the reënforced 14th Div., had reached Déva in the Maros valley and Kásva in the Görgény valley, and with sections of the 8th Div., was already pressing at Kibed on the Kukülló position. With the reënforced 7th Div. the west of Székely-Keresztur was reached, where the 19th Mountain Bde., already much weakened, could only defend itself with difficulty against the overwhelming pressure, while the 71st Inf. Div. on their left wing had definitely to give way.

On the evening of Sept. 17 Gen. Erich von Falkenhayn, with the staff of the newly formed German IX. Army, arrived at Déva, and took over the command of Gen. von Staabs' troops, and of all the reënforcements coming into this district. His commission was, in conjunction with the I. Army, to throw the enemy out of Transylvania, and for this purpose, while masking the Vulkan and Szurduk passes, to surround the enemy posted at Hermannstadt, with a double ring, and beat him. Gen. von Falkenhayn first ordered Lt.-Gen. Sunkel, commanding the 187th Inf. Div. in the neighbourhood of Petroseny, who was about to push the Rumanians back to the frontier passes, after reaching this line to send all the troops he could spare from his div. and the Alpine Corps towards Hermannstadt; he ordered the assembly of the 187th Inf. Div. at Reussmarkt, of the Alpine Corps at Sinna, and the disentrainment of the 76th Res. Div. at Markt-Schelken. Finding by a reconnaissance in the direction of the Roter Turm Pass that the road was practicable for mountain troops without wheeled transport, he decided to direct the Alpine Corps by way of Cindrelu and Prezbe towards the Roter Turm, in order to hinder the retreat of the Rumanians by this route, while the 187th Inf. Div., the 51st Honved Inf. Div., the 76th Res. Inf. Div., and sections of the Schmettow Cav. Corps, were to attack W. and E. of Hermannstadt in the direction of the northern outlet of the pass. This was not indeed a double encirclement of the enemy, as had been ordered by the Supreme Command, for which the forces of the eastern wing, where only a few squadrons could be made available, were insufficient. It was, however, a far-reaching enveloping movement against the one passable rearward communication of the enemy, in coöperation with an energetic attack on the front, of which the object was to destroy the group composed of the 2nd and 13th Rumanian Inf. Divs., under Gen. Popovici commanding the I. Corps.

On Sept. 22 Gen. Popovici attacked, but only attained success southward of Cornaticlu against the extremely thinly held positions of the 7th Cav. Bde. of the 1st Div., being everywhere else completely repulsed. The expected continuation of the Rumanian attack on Sept. 23 did not take place, and it was possible to issue orders for the projected battle. By Sept. 25 the XXXIX. Res. Corps with the 187th Inf. Div. were able to be assembled at the foot of the mountains S.W. of Hermannstadt, the 51st Honved Inf. Div. to the N.W., and the 76th Res. Inf. Div. to the N.E. of the town, while the Alpine Corps was to be within a day's march of the Roter Turm Pass. The general attack in the direction of the pass was to begin on Sept. 26; the Alpine Corps was to endeavour to reach the E. side of the pass in order there also to block the bridle-tracks leading over the mountains. The Schmettow Cav. Corps might, in the event of further pressure by the enemy, give way with its right wing, but with its centre on the Alt and its left wing towards Fogaras it was to hold its ground obstinately, and, in addition, if the operations proceeded according to plan, to arrange to push forward from the N.E. over the river towards the entrance of the pass. The I. Army Command was asked, as soon as possible, to place the 89th Inf. Div. in readiness at Schässburg (Segesvár).

The Rumanians standing at Hermannstadt did not interfere further with the preparations for the attack; on the other hand the 11th Rumanian Div. stationed at the Szurduk Pass attacked again on Sept. 25, and regained possession of Petroseny. The 144th Inf. Bde., reënforced by two German battalions and two batteries, held the heights N. of the place. The IX. Army Command did not contemplate further reënforcement, but the unattached staff (*i.e.* without troops) of the German 301st Infantry Div. was sent there, under the direction of which were placed the 144th Inf. Bde. and the Austro-Hungarian 2nd Mountain Bde., which had arrived on the 28th; and with these forces the Rumanians were again compelled to give up the extremely valuable coal basin.

The Battle of Hermannstadt (*Nagy Szeben*).—On Sept. 26, favoured by beautiful autumn weather, the attack began, and it continued with undiminished violence against the obstinate defence of the Rumanians until the evening of Sept. 28. It ran, on the whole, the course intended by Gen. Falkenhayn.

The Alpine Corps had already reached Roter Turm, Riu Vadulin and Câneni with their advanced troops on the road to the pass, early in the forenoon of Sept. 26. The Rumanians indeed now thoroughly realized the magnitude of the danger which threatened them, and delivered the most violent counter-attacks from N. and S. against the detachments of the Alpine

Corps. These troops might be temporarily pushed back at one point or another, but the road over the pass now lay continuously under German fire, which inflicted heavy losses on the Rumanian columns still attempting to break through. The Alpine Corps, however, did not succeed in reaching the E. bank of the Alt, and sections of the Rumanians were thus able to escape the threatened encirclement, and to cross the western spurs of the Fogaras Mountains.

The three divs. of the XXXIX. Res. Corps made a concentric attack between Orlat–Hermannstadt and the heights to the E. of it. It was only with difficulty that they at first gained ground, and not till Sept. 28 did they succeed in breaking the Rumanian resistance; but then, in consequence of the heroic endurance of the Alpine Corps, which made both escape and the bringing up of reënforcements from the S. impossible, the Rumanian defeat became a complete collapse. This collapse was precipitated when on Sept. 27 the 3rd Cav. Div. had succeeded, with two regts. of light horse, in crossing the Alt and narrowing S.W. of Porumbacu the circle of fire round the Rumanians, while the 18th Hussar Regt. of the 3rd Cav. Div. at Chertişiora secured the front towards the E., whence there had been since Sept. 27 increasing indications of an advance by the Rumanian II. Army.

As the bringing up of reënforcements through the Roter Turm Pass from the S. failed, the Rumanian Command were compelled to set the II. Army on the march towards Hermannstadt to relieve the seriously threatened group under Gen. Popovici. The II. Rumanian Army executed their movements slowly and with difficulty, and since an advance on the shortest line in the Alt valley from the N. over Fogaras from the Agnetheln-Henndorf district might easily have been threatened on the flank, the Rumanian Army Command thought themselves first compelled to secure freedom of movement N. of the Alt river. The sections of the 71st Inf. Div. in the forward positions were therefore first pressed back, and then the 6th Cav. Bde. of the 1st Cav. Div. standing N. of Klein Schenk were thrown back westwards. Meanwhile, the Austro-Hungarian I. Army Command had sent from Schässburg to Henndorf the greater part of the 89th Inf. Div., one infantry regt. and one light field-howitzer detachment going off by rail as army reserve to Salzburg (N. of Hermannstadt). Pushing between the 71st Inf. Div. and the Cav. Corps, they made on Sept. 28 a successful attack in a southerly direction, and so put the brake on the advance of the Rumanian troops N. of the Alt. The I. Army of Gen. Arz had to withdraw steadily westwards under the superior weight of the IV. Rumanian Army, and as the seriously weakened 19th Landsturm Mountain Bde. especially had great difficulty in withstanding the continued Rumanian attacks in the direction of Schässburg, the I. Army Command considered it necessary to withdraw the 71st Inf. Div. to the Little Kukülló (Kokel). Gen. Falkenhayn urgently dissuaded them from this move, as it would expose his eastern flank to an unbearable threat. He also expressed his doubt as to the ability of the I. Army, when once it had been pressed back behind the line of the Maros and the Little Kukülló, to maintain that position permanently with its present forces. Thereupon the withdrawal of the southern wing of the I. Army was delayed.

On the afternoon of Sept. 28 the Rumanians again attacked the 1st Cav. Div. N. of the Alt, and pressed them back to the heights E. of the Haarbach; the reserve, not required at Hermannstadt, was hastily sent with heavy motor wagons through the Haarbach valley to the aid of the heavily engaged Schmettow Cavalry Corps. Meanwhile, however, the fate of the Rumanians in the Roter Turm Pass was sealed, the attacking troops of the XXXIX. Res. Corps ceasing to meet with serious resistance in the early morning of Sept. 29. Those who were not able to escape through the forests over the mountains fell a sacrifice to the inexorable onslaught. The bulk of the Rumanian I. Army was destroyed. Three thousand prisoners—a relatively small number—were taken, but the whole of the artillery and the whole train fell into the hands of the victors.

It was now necessary rapidly to take new decisions for fighting the II. Rumanian Army, the threat of whose approach was imminent. In accordance with the instructions received, the IX. Army was to gather all its strength, and to deliver an enveloping attack from the S. against the southern wing of Rumanian main forces pushed forward W. of Fogaras. Falkenhayn intended to relieve the Alpine Corps for this purpose by the 51st Honved Inf. Div., to assemble the 76th and 187th Inf. Divs. on the heights of Scorei on both sides of the Alt, and then to push forward in an easterly direction, an enveloping attacking movement in the Fogaras mountains being assigned to the Alpine Corps. But the rapid and violent push of the Rumanians in the space between the Haarbach and the Alt on Sept. 29 entailed changes in the plan of operations. The relief of the Alpine Corps had to be given up, as involving too much time; instead, the 51st Honved Inf. Div. and the 76th Res. Div. were to reach as rapidly as possible the Alt valley S. and N. of Avrigu and the 187th Inf. Div. Cornaticlu in the Haarbach valley. The seriously weakened Cavalry Corps was to attach itself for the forward movement to the N. wing of the 187th Inf. Div. Of the I. Army, the 89th Inf. Div. and the strongest possible sections of the 71st Inf. Div., under the command of Lt.-Gen. von Morgen, were asked to attack in the direction of Bekokten. The beginning of the attack was proposed for Oct. 1.

To the surprise of their enemy the Rumanians did not continue the attack N. of the Alt on Sept. 30, but withdrew a little from the Cavalry Corps. With this object they attacked S. of the Alt and drove back the 18th Hussar Regt. westwards of Chertisiora. The weariness of the troops and the almost impassable state of the roads, owing to the rain which had set in, delayed the forward movements, and it was agreed to begin the attack on Oct. 2. The Rumanians did not take advantage of the loss of time this entailed on the German-Austrian side, but entrenched themselves in the positions they had reached.

The unification of the command in Transylvania was established by placing the Austro-Hungarian I. Army from Oct. 1 under the operative control of Falkenhayn.

On Oct. 2 began the advance of the XXXIX. Res. Corps, the Schmettow Cav. Corps and the I. Res. Corps. South of the Alt the Rumanians offered no resistance, but retreated according to plan before the German advanced troops. North of the Alt, after strong forces had been brought up by way of Gross Schenk in a westerly direction, the advance also began. The 89th Inf. Div. attacked in the direction of Bekokten, and at first obtained a great success, but was thrown back to its point of departure by a Rumanian counter-attack. The 71st Inf. Div. had not been able to join in this attack because its artillery was not yet in position on account of the softness of the chalky roads after rain. Lt.-Gen. von Morgen thought the situation of these two divs. so endangered that he intended to withdraw them as far as the sector Henndorf–Jakobsdorf. On Oct. 3, however, this idea was abandoned, as the enemy themselves had withdrawn eastwards. Owing to this movement touch with the Rumanians became extremely loose, which made it exceedingly difficult for the Austro-German Command to discover betimes the measures taken by them.

On their side the Rumanians had obviously abandoned as early as Oct. 2 the idea of continuing the offensive. Impressed by the annihilating defeat at Hermannstadt and recognizing the impossibility of attacking in a tactically unfavourable situation the IX. Army, rapidly advanced eastwards, they had decided to withdraw betimes in order to defend the frontier passes. In order to secure the time necessary for the threading of the marching columns into the passes of the Geisterwald, the Hargitta and the Görgény mountains, the Rumanians undertook a series of forward pushes: on Oct. 1 S. of the Alt, and on Oct. 2 against the 89th Inf. Div. Against the I. Army these attacks continued until Oct. 5, and during them the Rumanians, especially on Oct. 3, obtained a fresh success against the 19th Landsturm Mountain Bde. and the Landsturm Hussars.

Though the IX. Army Command could not yet fully discern the intentions of the enemy, the puzzling behaviour of their opponents seemed no reason for delay, and the advance was therefore pushed forward with the utmost speed. The 3 divs. of

Lt.-Gen. Staabs were taken into the space S. of the Alt, the I. Res. Corps was to reach the passages over the Alt at Comana and Hèviz, while the Cav. Corps was to reach the N. wing of the IX. Army.

The Battle in the Geisterwald.—The Rumanians retired on the whole E. front, without being brought into action by the pursuing troops of the Austro-Hungarian I. Army and the German IX. Army. It was only after dusk on Oct. 4 that the XXXIX. Res. Corps was able to bring the Rumanians to a stand on the western slope of the Geisterwald in a prepared position behind the Şinca brook. The corps were ordered to attack early on Oct. 5, while the 76th Res. Div. was to advance along the high road to Volkány, the 51st Honved Inf. Div. to Vledèny, and the 187th Inf. Div. over the mountains, enveloping the enemy on the N., in the direction of Krizba. The 8th Mountain Bde., just arrived at Hermannstadt, was ordered to follow the XXXIX. Res. Corps forthwith in the Alt valley. It was intended to allow them to advance W. of the Königstein towards the road Kronstadt–Câmpolung.

Morning mists and the time taken by the enveloping movement of the 187th Inf. Div. in roadless mountain country delayed the beginning of the attack on Oct. 5. In order to lose no time Lt.-Gen. von Staabs ordered the 76th Res. Div. and the 51st Honved Inf. Div. to attack alone in the forenoon; they soon captured the Rumanian positions, the Rumanian 4th and 3rd Inf. Divs. suffering heavy and bloody losses in their violent counter-attacks. But when the enveloping movement of the 187th Inf. Div. became effective the Rumanians began their retreat into the Kronstadt basin with the utmost haste, at the cost of a great part of their artillery. Close upon them followed the victorious divs. of Gen. von Staabs. Meanwhile the advance guard of the 89th Inf. Div. had reached Comana on Oct. 5, after, by quick action, succeeding in putting out the fire which the Rumanians had set to the bridge. After a stiff pursuing action the 71st Inf. Div. took Reps, but, N. of Hèviz, met with strong resistance from the enemy which was only broken down on the morning of the 6th. The 89th Inf. Div. which had been brought up here, was marched through Hèviz in front of the 71st and directed over the Bogat saddle towards Földvár. The Schmettow Cav. Corps had assigned to it the task of throwing back the 2nd Rumanian Cav. Div. over the line Mehburg-Pálos. But the Rumanian Horse escaped attack by a hasty retreat towards the N.E., and established temporarily contact in the Upper Alt valley between the two Rumanian armies, which were diverging more and more.

The Battle of Kronstadt (*Brasov*).—On Oct. 6 the divs. of the XXXIX. and I. Res. Corps in their marching lines sought to reach the western outlets of the defiles of the Burgenland. The attack on the 3rd, 4th and 6th Divs. of the Rumanian II. Army, crowded together around Kronstadt and entangled with one another during the retreat, was fixed for Oct. 7. The 76th Res. Div. was to reach the Törzburg Pass by way of Tohanulu–Törzburg. Kronstadt was the goal fixed for the 51st Honved Inf. Div., advancing by Feketehalom, while the 187th Inf. Div., attacking to the N. of it, was to wheel inwards, its flank protected from the N.E. in order to envelop Kronstadt and the entrance to the pass S.E. of it. On Oct. 7 the 89th Inf. Div. was to reach Földvár and the 71st Inf. Div. Miklosvár. Of the Cavalry Corps the 3rd German Cav. Div. was to push forward through Barót towards Mikoujfalu, to hinder Rumanian movements of troops in the Alt valley; the 1st Cav. Div., pressing forward towards Szt. Egyházas-Olahfalu, was to bar the retreat of the rear sections of the Rumanian troops still on the Szekely-Udvárhely–Csikszereda road.

On the early morning of Oct. 7 the vanguard of the 76th Res. Div. emerging from the mountains at Tohanulu was caught by the Rumanian artillery fire, and could penetrate no farther. The main body had therefore to make a wide détour by Zernesti against the Rumanian left flank, and a pause was made for the arrival of the heavy artillery. Thus this div. could make no further progress on the 7th. But the 51st Honved Inf. Div. and the 187th Inf. Div. rapidly approached Kronstadt, meeting, however, with violent resistance from the Rumanians on the N. and W. sides of the town, so that it was not until evening that the vanguard of the 187th succeeded in penetrating into the northern part of the town, where an obstinate street fight raged all night. Next morning the 51st Honved Inf. Div. also won their way in and stormed the heights S. of the town.

In consequence of the enveloping movement through Zerneste and the threat exercised by the 8th Mountain Bde. approaching W. of the Königstein it became possible for the 76th Res. Div. on Oct. 8 to seize Törzhurg and the heights on either side of it, together with the entrance to the Törzburg Pass. The advance against the pass was continued, and, in addition, a detachment was pushed forward through the Klein Weidenbach valley towards the Tömös Pass in order to bar the Rumanian retreat here. Although this div. failed to reach the road, its appearance in threatening proximity caused a panic-like flight of the troops and transport hastening southwards.

Meanwhile the Rumanians tried to hold up the German advance N. of Kronstadt, and, with reënforcements hurried up partly by rail from Sepsi-Szt. György, delivered violent counter-attacks against the E. wing of the 187th Inf. Div., standing at Szentpéter, which was hard pressed till the attack of the 89th Inf. Div. from the N. struck the Rumanians unawares.

Early on Oct. 9 the victory of the IX. Army was complete. The beaten troops of the 3rd, 4th and 6th Rumanian Divs. retreated hurriedly through the passes, so that, supported by the 10th, 21st and 22nd Inf. Divs. brought up for the purpose, they might undertake the defence of their country against the pursuing German and Austro-Hungarian divs. in fortified positions on the frontier prepared during peace.

Gen. von Falkenhayn in his pursuit tried to cross the mountains simultaneously with the Rumanians, and by a fresh distribution of his army, the I. Res. Corps with the 76th Res. Div. and the 8th Mountain Bde. attacked over the Törzburg Pass in the direction of Câmpolung. Through the encircling movement of the 8th Mountain Bde. the pass was soon successfully opened, and the 22nd Inf. Div. which had arrived to support the seriously exhausted Rumanian 4th Inf. Div. was repulsed. But the attack of the I. Res. Corps was held up by the strongly-fortified positions N. of Câmpolung.

The XXXIX. Res. Corps had orders to push forward through the Tömös Pass with the 51st Honved Inf. Div., and through the Altschanz Pass with the 187th Inf. Div. towards the line Sinaia–Isorcle. The 51st Div. did indeed succeed in storming the summit of the pass, but could not penetrate the 21st and 10th Rumanian Inf. Divs. in their strongly constructed positions. The 187th Div. had a similar experience against the Rumanian 3rd Inf. Division.

The 89th Inf. Div. had to attack through the Tatarhavas and Bodza passes. After reaching the basin lying S. of the frontier, it was held up by the main body of the Rumanian 6th Inf. Div. and by separate regts. of the 3rd, 15th and 22nd Inf. Divisions.

As the German Supreme Command urgently demanded that the strongest possible infantry and cavalry forces should be directed towards Ocna, to control the communications from there northwards by rail, road and telegraph, the 71st Inf. Div. was put under the command of Gen. Count Schmettow, commanding the Cav. Corps, who led the div. in forced marches to the Ojtoz Pass. On the summit of the pass the div. overran a position held by the Rumanian 2nd Cav. Div. and forced their way over the frontier. Recognizing their peril the Rumanians rapidly pushed up the 38th Inf. Bde. and sections of the 7th, 8th and the newly formed 15th Inf. Divs., and after long engagements with many vicissitudes prevented the 71st Inf. Div. from reaching its goal.

The 3rd Cav. Div. assembled first in the basin of Kézdivásárhely, where the 1st Cav. Div., which had pursued the Rumanian 7th Inf. Div. up to the Uz Pass, had also been brought up. As the employment of cavalry on the route by way of Ocna into Moldavia had become impossible, the 1st Cav. Div. established communication in the forest-clad mountains, with their lack of roads, between the 89th and the 71st Inf. Divs. The three regts.

of the 3rd Cav. Div. were later on stationed between the Törzburg and the Tömös passes as the Transylvania Cavalry Brigade.

At the Roter Turm Pass the Rumanians—the remainder of the 13th and 23rd Inf. Divs. and the 2nd mixed Brigade of the 18th Div.—had discontinued their attacks against the Alpine Corps, reënforced by the 10th Mountain Bde. At Petroseny the 11th Rumanian Inf. Div. had again been pressed back to the frontier, whereupon the 2nd Mountain Bde. was shifted to the Roter Turm Pass. This was subsequently merged with the 10th Mountain Bde. in the 73rd Inf. Division.

In the Austro-Hungarian army the VI. Corps, with the 39th Honved Inf. Div., reached the frontier in the Uz valley and with the 61st Inf. Div. and the 1st Landsturm Hussar Bde., in the Trotus valley advanced far over the frontier and, after fighting with varying success against the Rumanian 7th Inf. Div., occupied positions on the height of Sulta. On the N. wing the XXI. Corps with the 72nd Inf. Div. reached the Békás Pass, and with the 37th Honved Inf. Div. the Tölgyes Pass. Thus Transylvania, six weeks after the invasion of the Rumanians, was again freed from the invader.

Plans for the Continuation of Operations.—New plans had now to be agreed upon, in order to beat the Rumanians in their own country. Naturally the centre of gravity of the operations against Rumania lay in the first instance in Falkenhayn's IX. Army. His attempt to push forward on the shortest line to Bucharest with the troops he had in hand in the pursuit over the passes S. of Kronstadt had not succeeded. The Rumanians now defended themselves much more obstinately, and the German and Austro-Hungarian troops, wearied with their rapid operations, and with their war establishments weakened, had suffered temporarily in buoyancy from this victorious career. Events moved slowly also on the Roter Turm Pass, from which, after crossing the mountains, the main push directed towards Bucharest ought to have been supported by an advance of the reënforced Alpine Corps through Pitești. The pursuit on all the many passes radiating from the Kronstadt basin had dissipated strength, and made the assembly of a strong main force impossible. New forces had to be brought up. These rolled up in Transylvania in the middle of Oct.—the 8th Bavarian Res. Div., the 11th and 12th Bavarian Inf. Divs. and the 6th German Cav. Div.; towards the end of Oct. two further German inf. divs. (the 41st and 109th) and the 7th Cav. Div. were to follow. Moreover, the Austro-Hungarian Higher Command intended to transfer the Austro-Hungarian 3rd and 10th Cav. Divs. to Transylvania, but these would first have to be equipped and organized for employment in the intended offensive.

The 8th Bavarian Res. Div. was sent to the Transylvanian E. front to reënforce the I. Army. The 12th Bavarian Inf. Div. was placed by Falkenhayn under the I. Res. Corps on the Törzburg Pass, the 11th Bavarian Inf. Div. was to attack over the Szurduk Pass with the 144th Inf. Bde., and the group of Lt.-Gen. von Krafft at the Roter Turm Pass was strengthened by 2 Bavarian inf. regts. and 2 German Landsturm regts. At the Tömös, Törzburg, Roter Turm and Szurduk passes the attacks were to be continued, and wherever a gap was first effected Falkenhayn intended to bring up the mass of cav. and the two later arriving inf. divs. to open up the remaining passes southward and in conjunction with Field-Marshal Mackensen's troops, to push forward towards Bucharest.

Both the Supreme Army Commands agreed to this plan. But the Higher Command at Teschen maintained in this connexion that it was desirable for the main pressure to be directed on the line Kronstadt–Bucharest. There the strongest opposing Rumanian and Russian opposing forces were to be expected; moreover, here they had to reckon with a threat of a Russian relieving offensive, urgently asked for by the Rumanians, coming from Moldavia in the general direction of Csik-Szereda. Falkenhayn therefore rather favoured a push through the Szurduk Pass, where, owing to the smaller width of the mountain chain, the Wallachian Plain would be most quickly reached.

On the E. front, meanwhile, the headquarters of the Army Front Commander, Archduke Charles Francis Joseph, in the arrangement of the commands, was moved from East Galicia to Grosswardein, as from Oct. 13, and the German IX. and Austro-Hungarian I., VII. and III. Armies were placed under him.

The Conquest of the Dobruja and of Wallachia.—After the battle of Kronstadt the Rumanians were entirely reduced to the defensive. On the Transylvanian front they limited their activities to attempts to win back the lost frontier heights commanding important roads of invasion. The Rumanian Army Command also tried to induce the Russians to relieve the Rumanian troops in the Dobruja and on the Transylvanian E. front in order thus to set free forces for the defence of Wallachia.

On the Danube front the Rumanians on Oct. 1 had crossed the river at Rahova (S. of Bucharest) with a div., and had temporarily gained a firm footing. German and Bulgarian troops, rapidly assembled, compelled the Rumanians to return to the N. bank, the latter suffering severe losses, as the Austro-Hungarian Danube monitors had shot to pieces the Rumanian pontoon bridge. Rumanian forward pushes against the Bulgarian III. Army brought no success. On Oct. 19 an attack by Gen. Toshev's Army (Bulgarian 1st, 4th, 6th Divs., and sections of the 12th Inf. Div., 1st Cav. Div., Turkish VI. Corps, with the 15th and 25th Inf. Divs., German 217th Inf. Div.), broke through the Russo-Rumanian front on their E. wing, and drove the opposing army far over the Cernavoda–Constantsa railway, Rumania thereby losing her only rail connexion with the sea.

While the bulk of the Bulgarian III. Army followed only as far as the line Lake Tasaul–Bazanliia–heights of Kualnik–Danube S. of Topal, and settled themselves for the defence on this shortest line between the Danube and the sea, the reënforced cav. div. pursued the retiring Rumanians and Russians as far as the line Sariuri–Sarighol–Docuzaci. Gradually the Russians again slowly pushed forward southward against the new position of the Bulgarian III. Army. The Rumanian troops were withdrawn in Nov. from the Dobruja into Wallachia. Of the Russians there were in the Dobruja the VI. Cav. Corps, the XLVII. and IV. Siberian Corps, with 6 inf. divs. and 1 cav. div. in all, which were placed under the command of the newly formed Russian Danube Army (Gen. Sakharov).

In the new defensive position of the Bulgarian III. Army, which was by this time under the command of Gen. Neresov, there remained the 4th and the combined 6th Inf. Divs., then the 1st Cav. Div. The Turkish VI. Corps stood for the time being at Medzidie in reserve. The other troops in the Dobruja and northern Bulgaria, together with the expected Turkish 26th Div., were collected in the district around Sistova, and were placed in readiness for crossing the Danube as the new Danube Army under the command of Gen. Kosch.

On the Transylvanian S. front the obstinate struggle for the passes was continued. The I. Res. Corps succeeded in reaching a point just N. of Câmpolung after the arrival of the 12th Bavarian Inf. Div. and with the assistance of the enveloping movement in the mountains of the 8th Mountain Bde. on the W. wing. At that point irruption into the basin of Câmpolung was barred by a new strongly constructed position in which the newly brought-up Rumanian 12th Inf. Div., in addition to the 22nd Inf. Div., offered the most obstinate resistance.

At the Roter Turm Pass Lt.-Gen. von Krafft intended to force an exit from the mountains by enveloping on two sides, with the 2nd Mountain Bde. eastwards with the 10th Mountain Bde. westwards, and the Alpine Corps in the centre. The attack began on Oct. 16. After easy initial successes the weather broke on Oct. 18, and this circumstance, together with hastily executed Rumanian counter-attacks, prevented complete success.

South of Petroșény the group of Lt.-Gen. Kneusel, with the 11th Bavarian Inf. Div., the 144th Inf. Bde., and the 6th Cav. Div., began the attack in numerous columns through the Szurduk and Vulkan passes and over the heights to the west. In spite of the fall of snow the advance began on Oct. 23.

News had been received that, under pressure of the preceding attack by Krafft's group and the I. Res. Corps, the Rumanians had deflected against these reënforcements which had been sent up, and that it would therefore be easier to break through. At first,

indeed, complete success attended the attacks of the Kneusel group. The troops, forcing back the Rumanian 11th Inf. Div., had worked their way to the foot of the mountains N. of Târgu Jiu, and were to fight their way out to the plain on Oct. 27. At this point, however, a counter-attack by the hurriedly summoned Rumanian 21st and 22nd Inf. Bdes., and a regt. of the 1st and 3rd Inf. Divs., struck the W. wing. After losing many in prisoners and guns the German detachments had again to withdraw to the frontier heights, whither the Rumanians pursued them only with skirmishing detachments. In spite of the defeat he had suffered Falkenhayn held fast to the idea of a break-through by way of Târgu Jiu, and directed the newly arriving troops (41st and 109th Inf. Divs. and 7th Cav. Div.) to Petrosény. After the experience just gained the most thorough preparations were to be made for this operation, which was to begin on Nov. 11, Lt.-Gen. Kühne of the LIV. Res. Corps being chosen for the command of this strengthened group.

Urged by the Rumanian Army Command, the Russians relieved the Rumanian troops facing the Austro-Hungarian I. Army, beginning from the N., and pushed the southern boundary of their IX. Army in the middle of Nov. to a point just N. of the Gyimes Pass. Simultaneously with the III. Cav. Corps and the XXXVI. Corps, they attacked in this new sector the Austro-Hungarian XXI. Corps on Nov. 6. In expectation of this Russian push forward the army front command had placed in reserve the Brudermann Cav. Corps (3rd and 10th Cav. Div.) in the district Olah-Toplica-Gyergyó-Szt. Miklós, the 10th Bavarian Inf. Div. brought southwards from the VII. Army in the district around Csik-Szereda, and the bulk of the 8th Bavarian Res. Div. at Kézvivasarhely. The Russian forward movement obtained small successes on both sides of the Tölgyes and Békás Pass. After the bringing up of the 10th Bavarian Inf. Div. and the 3rd Cav. Div. the situation was once more restored.

In the Ojtoz Pass also, where the 71st Inf. Div. and the 1st Cav. Div. were once more placed under the I. Army as from Oct. 29, and in the Trotus valley, the Rumanians, partly mixed with Russian units, attacked on Nov. 5 without obtaining noteworthy successes.

The Break-through at Târgu Jiu.—According to plan, the attack of the group of Lt.-Gen. Kühne began on Nov. 11 S. of the Szurduk and Vulkan passes. They were to force their way into the Wallachian plain before the approach of winter made mountain operations impossible. Simultaneous attacks on all the other passes of the Transylvanian S. front and at Orsova were to distract the attention of the Rumanians and divert their reënforcements from the principal theatre of attack, an intention which was successfully accomplished.

Protected by the 41st Inf. Div. on the W., with the 109th and 301st Inf. Divs. E. of the river Schyl, on the W. flank by sections of the 6th Cav. Div. and the 9th Regt. of the Hungarian Landsturm, the troops fought their way out of the mountains in an obstinate struggle lasting from Nov. 11 to 14, and on Nov. 15 reached Târgu Jiu. The Rumanian 11th Inf. Div., seriously weakened, retired to the heights S. of the town, where it again gave battle with rapidly brought up new forces of about the strength of two divisions. In the Kühne group the Schmettow Cav. Corps (6th and 7th Cav. Divs.) was brought along the road over the pass and placed on the W. wing for the envelopment of the enemy; the 11th Bavarian Inf. Div., hitherto in reserve, was placed on the front E. of Târgu Jiu, while the 301st Inf. Div. acted as covering troops on the east.

On Nov. 16 the Kühne group attacked once more. On Nov. 17 the Rumanians, in spite of the most courageous defence, were decisively beaten. The road into Wallachia lay open. The pursuit was undertaken without delay. With the right wing (6th Cav. Div. and behind that the 41st) in the Jiu valley through Craiova, the centre (109th and 11th Bav. Inf. Divs.) towards Slatina, and the left wing (301st Inf. Div.) in the direction of Dragaşani, the group swerved eastwards and made rapidly for the Alt. On Nov. 21, Craiova, the capital of Wallachia, was reached. The rapidly attacking vanguard of the 6th Cav. Div. succeeded on the 23rd in seizing the bridge E. of Caracalu, which had remained undamaged, over which the main body of this division on Nov. 24 and the 7th Cav. Div. on the 25th crossed the Alt, in order to push on against the Vede sector.

The Rumanians, repulsed from Târgu Jiu (11th and 17th Inf. Divs. and parts of other divs.) placed themselves after the destruction of the bridges on the E. bank of the Alt between Slatina and Dragaşani, in order to bar at this point an advance by Lt.-Gen. Kühne's troops. Farther N. too, opposite the group of Lt.-Gen. von Krafft, the Rumanians had evacuated the W. bank of the Alt, so that the German troops were able to occupy Rimnik Valcea on Nov. 25. The attempts of the 41st and 11th Bav. Inf. Divs. on Nov. 25 and 26 to cross the Alt at Slatina failed, in spite of the support of some squadrons of the 7th Cav. Div., which had already come into action from a S.E. direction. The 109th Inf. Div. was now sent in support of the Cav. Corps by way of Caracalu, and was soon followed by the 11th Bav. Inf. Div. and the 115th Inf. Division.

In consequence of the rapid break-through at Târgu Jiu the retreat of the Rumanian Orsova group, 3 regts. of the 1st Inf. Div. with artillery, was cut off. Held in front by violent attacks on the part of the group of Col. Szivó, they were shut in on the rear by detachments of the Kühne group. In a series of engagements in which at one time they threatened the rear communications of the Kühne group, this Rumanian group went down along the Danube, until, completely surrounded at the mouth of the Alt, they laid down their arms before their pursuers on Dec. 6. Ten thousand men and 40 guns fell into the hands of the much weaker Szivó group.

In front of the group of Lt.-Gen. von Krafft, reënforced by the newly arrived 216th Inf. Div., the Rumanians also could not hold their own on the E. bank of the Alt in spite of the participation of the 7th and parts of the 8th Inf. Divs.; they retreated as far as Curtea d'Argeş and behind the Topolog sector, where they offered a temporary resistance.

The I. and XXXIX. Res. Corps (under which latter the 89th Inf. Div. in the Bodza Pass had been placed) maintained undiminished pressure on the Rumanian groups opposed to them. With the aim of building up a further reserve of the army front, the 187th Inf. Div. was relieved by the approaching Austro-Hungarian 24th Inf. Div., and placed in readiness in the Háromszék. The Ojtoz group now under the command of Gen. von Gerok, of the XXIV. Res. Corps, was on Nov. 12 again placed under the IX. Army Command. On the E. front the Russians continued the relief of the Rumanians as far as the road over the Ojtoz Pass.

Crossing of the Danube Army at Sistova.—On the side of the Central Powers the Army Command now thought the moment had arrived for the Danube Army in position at Sistova to cross the Danube and push forward towards Bucharest, in order, in conjunction with the approaching IX. Army, to effect the complete conquest of Wallachia. The Danube Army consisted of the 217th German Inf. Div., the 1st and 12th Bulgarian Inf. Divs., the combined Cav. Div. of Maj.-Gen. Goltz, German and Bulgarian Landsturm troops, German and Austro-Hungarian heavy artillery, the 26th Turkish Inf. Div. and Austro-Hungarian pioneer formations. At 4 A.M. on Nov. 23, favoured by thick mist, and supported by the Austro-Hungarian Danube monitors and the German motor-boat flotilla, the transport across the river of the 217th Inf. Div., unnoticed by the enemy, was successfully accomplished without delays. Zimnica was occupied. Then the 1st Bulgarian Inf. Div. and the Landsturm formations crossed; the resistance of Rumanian detachments brought up was rapidly conquered.

On Nov. 24 the bridge-head was widened, and the construction of a pontoon bridge by the Austro-Hungarian pioneer group of Maj.-Gen. Gaugl was begun, and finished in the afternoon of Nov. 25 at 6 o'clock. The remaining troops were now brought over the bridge in unbroken sequence, and the advance was begun; on the left wing the cav. div. towards Alecsandri, on its right the 217th Inf. Div., then the 12th and 1st Bulgarian Inf. Divs. The Turkish 26th Inf. Div. followed as Army Reserve behind the left wing. Rapidly advancing, and quickly

breaking the resistance of the Rumanian 18th Inf. Div. and the 1st and 2nd Cav. Divs. sent against them, the heads of the columns had already on Dec. 1 reached the Argeşu, S.W. of Bucharest. But in this hurried forward movement the Danube Army, after establishing only slight contact by means of cavalry at Roşi de Vede, again lost touch with the main body of the IX. Army, held up on the Alt sector; their left flank lay open.

Battle of the Argeşu.—The Rumanians recognized the opportunity offered them of falling on the rashly advanced Danube Army. They endeavoured, with their I. Army, to keep the Kühne and Krafft groups as far to the W. as possible, and also made violent frontal attacks across the Argeşu on the isolated Danube Army, and on Dec. 2 from the N.W., completely encircling the left wing of the Danube Army, with the Rumanian 1st Cav. Div., then parts of the 2nd, 5th, 9th and 19th Inf. Divs. The Danube Army was thus placed in an extremely critical position. Rapidly brought-up Landsturm battalions, a few pioneer companies and the 26th Turkish Inf. Div., advancing in the second line, compelled a pause in the Rumanian enveloping movements. This Rumanian manœuvre, which only failed of success because it was not executed with sufficient energy, was coincident with violent pushes carried out by the Russians on the Carpathian front, from the Tartar Pass southwards to the Ojtoz Pass and on the Dobruja front, and also with attacks by Gen. Sarrail's Army on the Salonika front, by which it was hoped to relieve the hard-pressed Rumanian Army and to snatch from the Central Powers the advantage developing in this area. Yet all efforts were in vain.

The right wing of the IX. Army, which had been placed from Nov. 30 under the army group command of Field-Marshal von Mackensen, was brought up with the utmost haste. The 109th Inf. Div., advancing northward on Nov. 27 and 28 on the E. bank of the Alt, had at last succeeded in compelling the Rumanian I. Army to abandon the Alt sector. The 41st and 301st Inf. Divs. could then cross the river at Slatina. The pursuit towards the E. was conducted in the following groups: along the projected Craiova–Bucharest railway the 11th Bavarian Inf. Div.; behind that the 115th Inf. Div.; N. of the Bavarians the 109th, 41st and 301st Inf. Divs. The Schmettow Cav. Corps had ridden in advance of the right wing. Thus the IX. Army approached the seriously threatened left wing of the Danube Army. On Dec. 2 parts of the Cav. Corps, and on Dec. 3 the 11th Bavarian and 109th Inf. Divs., swerving southwards, were able to participate in the battle. The Rumanians, now themselves enveloped, turned back with heavy losses to Bucharest. For the Danube Army the crisis was over.

While on Dec. 2 and 3 the main body of the Schmettow Cav. Corps and the 109th Inf. Div. covered the road to Bucharest, Lt.-Gen. von Krafft at the same time, with the 216th, 73rd and 301st Inf. Divs., struck the remnant of the Rumanian I. Army on the middle course of the Argeşu, and pushed forward with the Alpine Corps and the 2nd Mountain Bde. towards Tirgovişte, which, after the capture of Câmpolung, the I. Res. Corps was also approaching.

Attacks by the just arrived Russian 40th Inf. Div. and the 8th Cav. Div. on Dec. 4 and 5 against the Bulgarians on the S. wing of the Danube Army gave no results. The violent attacks delivered by the Russians against the Austro-Hungarian Army and against the Bulgar-Turkish Dobruja front in the beginning of Dec. were also continuously repulsed.

The Capture of Bucharest.—On the evening of Dec. 5, after successful engagements, the Danube Army stood E. of the Argeşu and S.W. of Bucharest, and the IX. Army in close touch N. of the town as far as the Prabova valley. Since it was doubtful whether Bucharest would be defended as a fortress, heavy artillery and all the means of attack were placed ready to hasten its capture. In the night of Dec. 5–6 cavalry of the Schmettow Corps rode up towards the N.W. front, and found the works blown up and ungarrisoned. The Rumanians evacuated their capital almost without fighting. On the night of Dec. 6 the troops of the Danube Army and parts of the S. wing of the IX. Army entered Bucharest, while on the same day Falkenhayn's N. wing captured Ploesci, and with it the important petroleum area, where English hands had previously rendered the boring apparatus useless for a considerable length of time. Two days later, as the result of rapid enveloping movements carried out by Lt.-Gen. Morgen's group, the 4th Rumanian Div., left stranded in the mountains, were surrounded in the district N. of Ploesci, and were taken prisoners. The road to the S. now also lay open to Lt.-Gen. Staabs' group. The 51st Honved Inf. Div. was able to occupy Sinaia.

Pursuit to the Danube–Sereth Line.—Field-Marshal von Mackensen now received the order to push forward with his army group (III. Bulgarian Army, Danube Army and IX. German Army) to the shortest line of communication between the sea and the Carpathian front, that is the Danube mouth–Galatz–Sereth to Ajudumiu–Trotus river. The IX. Army was to advance between the mountain river and the projected railway line Bucharest–Urziceni–Foreivechii–Tecuciu; the Danube Army between this line and the Danube; the Bulgarian III. Army to advance in the Dobruja.

On Dec. 12 the IX. Army threw the Rumanian I. and II. Armies, reënforced by the Russian IV. Inf. and VI. Cav. Corps, out of a fortified position on both sides of Mizil, and on Dec. 15 took Buzĕu. There the 89th Inf. Div., which had advanced south-eastward from the Bodza Pass into the Buzĕu valley, joined Falkenhayn's army. The Danube Army on Dec. 14 won the way through the Jalomitsa sector against the Russian VIII. Inf. Corps and III. Cav. Corps. On Dec. 17 the two armies faced a Russo-Rumanian position running along the line from the lower course of the Calmatuciu by Foreivechii along the heights W. of Rimnicu-Sarat.

Meanwhile the Bulgarian III. Army had begun to clear the Dobruja and, meeting with little resistance, had soon reached the Danube estuary; turning towards the eastern bridge-head from Braila at Macin it transferred the Turkish VI. Corps to the Danube Army.

At Christmas the IX. and the Danube Armies broke through the enemy positions, and threw the Russians and Rumanians back northwards. On Jan. 4 1917 the Danube Army captured Braila, and pressed forward as far as the Sereth; on Jan. 8 the IX. Army took Focşani and the country N. of it as far as the Putna. On the S. wing of the army front the Archduke Joseph launched to the attack against the Russians in the last days of Dec. the Gerok group with the 218th Inf. Div., the 1st Cav. Div., the 71st Inf. Div. and the 187th Inf. Div. The S. wing fought their way through the extensive wooded mountain district, and effected a junction with the IX. Army. South of the Ojtoz road the attack came upon the Russians who were relieving the Rumanians. The Rumanian 15th Inf. Div. was again thrown into the action. The attack of the Gerok group only succeeded in winning a little more ground here. Fall of snow and sharp frost made further operations impossible.

The actual line won was fairly near the sector it had been intended to reach. On the side of the Central Powers it was decided to go into permanent positions here. There was reason to be satisfied with the success of the campaign. Transylvania was liberated; a country rich in resources, Wallachia, had been conquered; the Rumanian Army had been thoroughly beaten, and had for the most part ceased to be a factor in the fighting for a long time to come. The Russian Army, instead of giving the hoped-for support, had had in addition to take over another 400 km. of front. The Russians, too, were glad after a year too full of fighting to be able to rest. Besides the IX. Army (16th Inf. Div. and 2nd Cav. Div.), extending from the Bukovina to the Casinu valley south-eastward of Ocna, the Russian new IV. Army stood here from Racoşa on the Susita to Suraia E. of Focşani (6th Inf. Div.); from there eastwards to the Black Sea the VI. Army (9½ inf. divs. and 3 cav. divs.). Of the Rumanians only from 5 to 6 divs., reënforced by Russian troops, remained on the front as the Rumanian II. Army, between the Russian IX. and IV. Armies. The remnant of the Rumanian Army, saved with difficulty, was transferred to the district between Jassy and Târgu Frumos to recuperate. A French mil-

itary mission undertook to reorganize the army, and to give it a thorough education based on the principles of the conduct of modern warfare. This task it had finished by the summer.

The Battles N. of Focşani in the Summer of 1917.—In the spring of 1917 events took place of the most far-reaching significance for the conduct of the war in the East: the deposition of the Tsar, the outbreak of the revolution in Russia and the beginning of the collapse of the Russian army. As on all parts of the eastern front, so in Rumania, the Russian infantry had no more desire for fighting; the Russian artillery, left to carry on alone, were threatened by the infantry; indeed it came to regular battles between the two arms. It was only with difficulty that the numerous officers of the Western Powers distributed among the higher commands could prevent the collapse of the eastern front. The fighting value of the Russians did indeed improve at the time of the Kerensky offensive of June 1917, but the improvement was not a lasting one. The Rumanian troops remained untouched by all these happenings. Indeed it seemed as if Rumania's fighting strength increased in proportion as her ally became less reliable.

In the second half of July the reorganized Rumanian I. Army was placed between the Russian IV. and VI. Armies from a point E. of Nemoloaşa to S. of Tecuciu on the Sereth front.

In connexion with the operations in East Galicia the Central Powers intended to strike a decisive blow against the Russians and Rumanians in Rumania, in order to shake the whole Carpathian front and if possible to gain Moldavia. The operation planned across the Sereth at Nemoloaşa was to begin in August. The preparations for this were in train when the Rumanians anticipated the attack.

Rumanian Attack at Soveja.—On July 25 the Rumanian II. Army, with the IV. and II. Corps, and the Russian VIII. Corps on the N. wing of the Russian IV. Army, broke through the weak front of the 218th Inf. Div. and the 1st Cav. Div. and threw them far beyond Soveja back into the mountains, the wing division of the IX. Army being thereby surrounded on the N. and N.W. by the Russian VIII. Corps. Even though there was little need to fear Rumanian advance against Kèzdivâsârhely in the rear of the I. Army, on account of the width and impassable nature of the mountains, there was all the more danger that, after the capture of the Mt. Odobeshti (Odobeşti), the whole front of the IX. Army, which covered the sphere of the earlier Danube Army and was commanded by Gen. Kosch, might be rolled up from the north. This was obviously the intention of the Rumanians and Russians, but the troops in carrying out the operation did not strike hard enough. Precious time was thereby lost. On account of the want of roads direct support of the 218th Inf. Div. was hardly possible. It was only slowly that one regiment of the 117th Inf. Div., and then half the 37th Honved Inf. Div., which had been set free from the N. wing of the I. Army, could be brought up. The 217th Inf. Div. was supported by single regiments and battalions of 5 different divs. of the IX. Army, and the attack was thus barred.

In the counter-operation planned by the Central Powers it was intended to take up again the original plan of penetrating far into Moldavia. For this purpose the IX. Army was to conduct the main attack from Focşani W. of the Sereth in the direction of Ajudu Nuou, and simultaneously to cover this attack by the construction of a bridge-head on the E. bank of the Sereth in the direction of Tecuciu. A second push was to be delivered by the Gerok group from the Ojtoz valley on Onesci. By this means the Rumanian II. Army, which had advanced into the basin of the Soveja, was to be cut off.

Engagements North of Focşani and South of Ocna.—For the attack which was to start from Focşani the following were placed in readiness under the command of Lt.-Gen. von Morgen (I. Res. Corps): the 12th Bavarian Inf. Div., 76th Res. Inf. Div., and the 89th Inf. Div., to be followed in second line by the [illegible]-Inf. Div. As army reserve there stood at Focşani the [illegible] and 115th Inf. Divs. On Aug. 6 the attack began, and [illegible] indeed the desired success on the first day in a N.W. direction. The attempt to cross to the E. bank of the Sereth, however, failed.

The Russian Corps which were attacked (the VII. and behind that the XXX.) put up a surprisingly obstinate defence. It was only after throwing in the army reserves that the German I. Res. Corps succeeded in overrunning the Susita sector. Moreover, the 5th and 9th Rumanian Divs. of the Rumanian I. Army also came forward to face the attacking Germans, and caused considerable delay, especially at Marasesti (Marasheshti), by their violent, deeply écheloned counter-attacks.

On Aug. 10 the VIII. Corps with 3 (partly combined) divs. reënforced the attack of the Gerok group on both sides of the Ojtoz valley. They attacked the Rumanian IV. Corps (6th and 7th Inf. Divs.), and gained ground as far as just S. of Ocna and Grozesci. But on account of the obstinate resistance of the Rumanians the objective, Onesci, could not be reached.

Left of the I. Res. Corps the XVIII. Res. Corps, reënforced by the Alpine Corps, once more in action, had meanwhile joined in the attack with their left wing, and after heavy engagements had taken Panciu N. of the Susita. On Aug. 15 the S. wing of the Gerok group (218th Inf. Div. and sections of the 117th Inf. Div., half the 37th Honved Inf. Div. and the 8th Mountain Bde.) and the 217th Inf. Div., standing on the left wing of the XVIII. Res. Corps, also joined the attack and slowly drove the Rumanians out of the basin of the Soveja. A bridge-head on the W. bank of the Sereth threatening the German flank, held by the Rumanian 5th Div., was stormed by the 216th Inf. Div. of the I. Res. Corps on Aug. 14, severe losses being inflicted on the Rumanians. The further attempts of the I. Res. Corps, under which was placed the newly arrived 13th Rifle Div., to advance over the line Marasesti–Panciu, failed through Russian and Rumanian counter-attacks.

In consequence of the events in East Galicia and in the Bukovina, where the Russians were driven back to the old boundary of the Empire, a regrouping of troops and new distribution of the armies in Moldavia was effected. The troops of the Russian IV. Army were withdrawn to the N. to the VII. Corps, and the Russian IV. Army Command took over from the IX. Army Command the sector on the Transylvanian E. front as far as the Slanic valley. The Rumanian I. Army also took over the sector held earlier by the Russian I. Army, so that the two Rumanian armies now stood side by side.

On Aug. 28 the XVIII. Res. Corps, with the 216th Inf. Div. and the Alpine Corps, attacked from the line Panciu–N. edge of the Mt. Odobeshti in a N.W. direction, to gain the upper course of the Susita. After stubborn engagements lasting for many days against the Rumanian II. Corps, Jresci and the heights S. of the Susita were captured, upon which practically the old line, as it stood before the Rumanian attack, was reached. On Sept. 3 attacks from the German side were again suspended.

At the beginning of Sept. the Rumanians with the IV. Corps conducted a series of violent attacks against the advanced positions of the VIII. Corps, especially against the 225th Inf. Div. standing just S. of Ocna, but they were bloodily repulsed.

On the side of the Central Powers, after this unsuccessful enterprise, the troops which could be spared (the Alpine Corps, the 13th Rifle Div., the 117th Inf. Div. and much heavy artillery) were withdrawn for transfer to other theatres of war. The remaining units again went into permanent positions. On the Rumanian side the fruitless attacks ceased. They had suffered heavy losses in killed and wounded, and important loss in prisoners and material. The newly formed Rumanian divs., instructed by the French, had succeeded in defending their country from complete conquest. The battle of Marasesti, as it was called by the Rumanians, is the most famous page of the Rumanian Army in the World War.

Armistice of Focşani.—On Dec. 5 the commander-in-chief of the Russian S.W. front, Gen. Shtcherbachev, asked for an armistice. On Dec. 7 the negotiations began at Focşani under the presidency of Lt.-Gen. von Morgen; representatives of all the participating armies took part, and they were concluded on Dec. 10. (R. K.)

EASTMAN, GEORGE (1854–), American inventor and philanthropist, was born at Waterville, N.Y., July 12 1854. He was educated at Rochester and early became interested in photography. In 1880 he began to manufacture dry plates and four years later produced the first practicable roll film. In 1888 he invented the "kodak." In 1900 he gave $250,000 to the Rochester Mechanics' Institute. He has given laboratories to the university of Rochester and has donated $500,000 toward that university's endowment. To its school of music he has given $3,500,000 and to its medical school $4,000,000 (1920). In 1920 it became known that he had given at various times large sums to the Massachusetts Institute of Technology, amounting to $11,000,000.

EBERT, FRIEDRICH (1871–), first president of the *Reich* or German Federated Republic, was born Feb. 4 1871 at Heidelberg, where he attended the national elementary school and then learned tbe trade of a saddler; after he had become a journeyman he migrated, according to the German custom, from place to place in Germany, seeing the country and learning fresh details of his work until he finally settled at Bremen. There he became interested in the agitation of the Social Democratic party, obtained in 1893 an editorial post on the Socialist *Bremer Volkszeitung* and in 1900 was appointed a trade-union secretary and ultimately elected a member of the Bremen *Bürgerschaft* (comitia of citizens) as representative of the Social Democratic party; in 1905 he was elected to the presiding board of his party and was returned as a deputy to the Reichstag in 1912. In 1913 he was chosen as successor to Bebel to preside over the whole Social Democratic party. During the World War he endeavoured by negotiations with the Dutch and Swedish Social Democrats to prepare the way for united action by all the Socialists in the belligerent countries. He took part in 1917 in the Stockholm conference, which, however, had no practical result. He likewise endeavoured without success to bring about a German understanding with Russia. After the revolution he was one of the six commissaries of the people who formed the first provisional Government, in which he shared the presidency with the Independent Socialist Haase. His influence among the commissaries became predominant, and he rendered eminent services in conjunction with the Socialist War Minister, Noske, and the Socialist leader, Scheidemann, in the restoration of tranquillity and orderly administration. He was a keen opponent of all varieties of the Spartacist, Communist or Bolshevist movements, and bore a leading part in the suppression of the Spartacist insurrections. He was elected president of the Reich by tbe National Assembly at Weimar on Nov. 12 1919. (C. K.*)

EBNER-ESCHENBACH, MARIE, FREIFRAU VON (1830–1916), Austrian novelist (*see* 8.843), died in 1916. (*See also* AUSTRIAN EMPIRE: *Literature*.)

ECHEGARAY, JOSÉ (1833–1916), Spanish author and playwright (*see* 8.870), died at Madrid Sept. 16 1916. Together witb Frederic Mistral, he was awarded the Nobel prize in 1904.

ECONOMIC ENTOMOLOGY (*see* 8.896).—During 1910–21 the value of economic entomology as an essential part of applied science had been definitely realized throughout the civilized world (for MEDICAL ENTOMOLOGY, *i.e.* insects in human disease, *see*, under that heading, a separate discussion as an independent science). In tbe United States alone had the conditions of agriculture and horticulture previously been such that the farmers and fruit-growers were compelled to deal with their pests if they were to obtain crops at all; and economic entomology was then developed in America to an extent unknown elsewhere. But this limitation is no longer in effect, and the factors that have combined to bring entomology to its proper place in the sciences that underlie the practice of agriculture and horticulture are simple and clear. So far as relates to the older countries, witb an established and ordered system of crop-growing, whose stability and perseverance make in themselves for the minimum of insect prevalence, the comparatively small losses due to pests have now become important owing to the keener competition in crop production, the lowering of values and the greater care that has to be exercised to make a profit; when agriculture flourished the margin of loss due to pests could be neglected; but this had often approximated, in the last ten years before the World War, so closely to the actual profit that the losses, small though they might be, had of necessity to be checked. In the tropics, the opening up to cultivation of increasing areas in cotton, tea, sugar, coffee, palms, citrus and specially rubber has brougbt in its train insects which may entirely inhibit the successful cultivation of the crop if they are not dealt with.

The decade 1910–20 was one of extraordinary developments in the trials of new crops in fresh areas, and it is one of the cardinal principles of modern entomology, as explained below, that the introduction of new crops to new areas stimulates the outburst of immense insect epidemics; the British Dominions and colonies have followed the lead of Cape Colony and the West Indies, and bave found the entomologist a necessary officer on the staff of the agricultural department. The first entomologist appointed from the United Kingdom to such work took up his duties at the close of 1899; now a number leave England yearly to replace the vacancies or to fill new posts in the agricultural departments of the Dominions and the colonies of the Empire. A third factor, and one that will increase in importance, has been the immensely increased facilities for the rapid transport of plants and pests from one country to another, and also the increased desire to obtain the new varieties of tropical crops produced by the economic botanists of the tropical agricultural stations. Formerly the Royal Botanic Gardens, Kew, were the British centre of plant distribution, and while Kew was the home of many introduced scale insects, few pests were distributed apart from these; but the new varieties of cane from Java and the West Indies, the cotton seed from Egypt, Cambodia, Australia, the mango seed from the East, the rubber plants that circulated over the tropics, the countless shipments of tropical plants, have been the means of introducing pests to new countries, where, freed from the control of nature by means of natural enemies, they have bred and multiplied to their full extent and so constituted a very serious menace to cultivation. Experience has also shown that the new applied entomology is as practical a science as any other upon which the practice of agriculture depends. This was not always the case, and the amateur entomologist, whose interests were primarily confined to collections and nomenclature, did not impress the practical farmer as able to help him in his fight against enemies; this phase (from Great Britain and India notably) has not wholly passed, but it has so largely given place to the practical entomologist whose object is to eliminate the pest and thereby also the loss, that the entomologist is now recognized as necessary. A final factor is the growing recognition of tbe value of "team work," that is, of the coöperation of the plant breeder, plant physiologist, mycologist, bacteriologist, and "soil condition" expert, in tackling problems of plant hygiene, and their demand for the collaboration also of the entomologist able to deal with that aspect of the problem. Many insect problems are cases solely of gross damage by feeding insects; but many are tangled up with other disease phenomena, and in many cases an insect is the transmitter from plant to plant of virulent disease organisms. It will be evident that the older type of entomologist, whose interest in the insect ended witb its classification and the enumeration of tbe synonyms under which it was known in the literature, must be replaced by the more widely trained man capable of collaborating in these complicated problems.

Training.—In 1900 there were few facilities for training outside of the colleges and experiment stations of the United States, and the entomologist selected for responsible work in the colonies was required to have taken a degree in zoölogy and to have an amateur knowledge of entomology as then understood. Even in 1910, the English universities provided no better training, and the groundwork of a very thorough education in comparative anatomy and zoölogy was regarded as the one essential upon which could be laid a small amount of

entomological knowledge. A single British college established in 1911 a fuller course of specialized training, and has since provided a four-year course, designed to teach not only entomology but also so much of allied subjects as to enable the entomologist to collaborate readily and intelligently with his colleagues in plant physiology, plant breeding, mycology, bacteriology; it embraces some training in all these; it is divorced from zoölogy and the comparative anatomy of animals, except in so far as these are necessary to a wide comprehension of biological questions, and it provides a full and complete training in all aspects of applied entomology; further, a feature is the inclusion of research on some problem of applied entomology as part of the actual training, so that the trained student has had some experience of the kind of problem he will spend his life solving. Progress in this direction was being slowly made up to 1921 at other teaching institutions in Great Britain, but it contrasted poorly with the progress made in the United States in the provision of full facilities for training at many colleges and experiment stations. The problem of economic entomology in England had been to escape from the dominion of the zoölogist; the problem in America had been to incorporate sufficient science and to escape the anti-academic demands of the " practical man," to whom science as such did not appeal. It is probably true to say that both countries err, the English in being still too academic, the Americans in being too practical and too little sympathetic with the value of the " scientific " method of thought. This question was discussed at the Conference of Agricultural Entomologists arranged by the Colonial Office in England in June 1920, and while this Conference did not express any definite opinion, feeling was general that the ideal training was a groundwork of general horticultural or agricultural science, with the special training of the entomologist thereafter, and this is very nearly a mean between the present training of the Imperial College in London and that of most of the American colleges. The total number of entomologists required for science in the British Empire was not in 1921 sufficient to justify the provision of facilities for training at a number of universities, and it was possible that the establishment of tropical agricultural colleges might lessen the need of facilities in Great Britain, while providing better training for tropical problems. Careers in entomology had become far wider in 1921 than they were in 1900; in 1910 there was no official entomologist employed in England. The entomologist attached to the Ministry of Agriculture was in 1921 stationed at Harpenden, where he was in close touch with the Phytopathological Institute, with several entomologists employed upon research, and a beginning had been made with the appointment of local entomologists, each to advise a small group of countries and to work on the staff of the institutes designed to assist the progress of agriculture and horticulture. There are entomologists attached to the departments of almost every British colony, and the Dominions of Canada and South Africa maintain larger departments with considerable staffs. India was in 1921 still provided only with a small number of entomologists attached to some of the provincial governments, and had a small teaching and publishing section, not directly concerned with the checking of insect pests, at the Agricultural Research Institute. The most complete economic entomology department in India was that of the Madras Government, but entomologists were attached also to the agricultural departments of the Punjab, United Provinces, Bihar and Orissa, and Burma. A recent phase in the development of this subject is the increasing utilization of entomologists by companies engaged in the cultivation of tea, rubber, sugar-cane and similar products, or by associations of such companies. The Indian Tea Assn., the United Planters' Assn. of South India, the Colonial Sugar Co., and similar organizations in Malaya, Fiji, Jamaica, etc., maintain scientific staffs usually with entomologists, and there are considerable developments probable, now that the commercial community is realizing that economic entomology can be a sound, practical affair, and not an amateur scientific business of naming insects. In the United States, the development of entomology as a career for trained men has probably reached its limit; as the conditions of agriculture stabilize themselves, as the proportion of each crop becomes fixed, so the immense incidence of crop pests characteristic of America will diminish, and it is now probable that the main concern of the entomologist in that continent will be to safeguard the industry against the incursion of fresh pests from abroad. European countries have been developing very much as described above. Before the revolution in Russia, there had been an immense impetus to the development of entomology in that vast country; in France and Italy the entomologist is now being increasingly utilized, and while in Germany the subject had been neglected, since the war the Association of Economic Entomologists has stimulated the development of practical applied entomology. In Japan the development of the subject has come with the increase in scientific departments, and especially with the immensely valuable results derived from research on the silkworm-rearing industry.

Control of Pests.—The principles on which it is sought to control and check insect outbreaks developed very markedly during 1910–20 from " artificial control " based upon direct remedies and insecticides, to " natural control " based upon an understanding of the factors that produce outbreaks of pests and action arising from that knowledge. The first essential is a really intimate knowledge of the pest itself, its habits in all its stages, its senses and sense organs, its (almost) daily ways in the most minute particulars. It is now recognized that this must be carried to a degree of detail not contemplated before, and that upon the intimacy of this knowledge depends the successful application of any direct method. It is not sufficient to know that eggs are laid in such a way, in such number, at such a time, that the larvae moult so many times, feed in such and such a way and pupate, that the pupa takes a certain time, and then the adult emerges to mate, lays eggs and dies. An instance may be taken from the Codlin moth, whose larva hibernates in the winter in shelter; the full-grown larva leaves the fruit, crawls about, and for shelter will get under a flake of bark, spin a light cocoon and there remain. Will it do this on the trunk and branches, on the north (exposed) or the south (sunny) side, must the bark be dead or alive, will it prefer a band of bast, cotton, jute, wool, silk or what? Must this be double or single, tied on tightly or loosely, all round, at what height, when put on, when taken off? The investigator has to try to put himself as far as he can into the mentality of the insect, and the success of the entomologist depends much upon this instinct, which will yet be much developed. The second essential is a study of controls; what is it that, in its native habitat, checks the increase of the insect? Is it climate, food, plant scarcity, parasites, predaceous insects, birds, bats, lizards, frogs, etc., or disease due to fungi or bacteria? Usually it is direct parasites, predaceous insects, and perhaps, under suitable climatic conditions, disease due to fungi, bacteria or a virus. It is these natural checks which, in natural conditions, balance the rate of increase of the insect, which is large. The third essential is the nature of the conditions which produce an increase of the insect to such a point that it becomes a pest, that is, so injurious as to affect the crop yield materially. Normally there is under undisturbed natural conditions a balance of life; the checks and the natural increase of the insect are so balanced, in nature, that the insect never increases to a point of being destructive. But under artificial conditions of cultivation, man disturbs this balance; he clears land, disturbing the ratio of plant life; he interferes with the bird life particularly; he plants areas with crops, *i.e.* an unmixed plant area, which favours the increase of any insect capable of feeding upon that crop, since the parent insect has not to undergo a precarious hunt from plant to plant for the proper food plant for its young, but finds an unmixed block, thereby escaping many dangers. In addition, man introduces blocks of new crop plants, which have not acquired protection against indigenous insects, and which are at once attacked, lacking the protection they will in time develop. These are some of the factors

by which man's artificial cultivation of crops disturbs the delicate balance of life, and produces those fluctuations or "waves" of insect abundance which the entomologist recognizes as pest outbreaks that he has to deal with. If he can he has to trace to their origin these waves of increase, and the modern science of entomology is to do this as far as may be. In many cases the problem is the simple one of determining if the insect is an introduced one; if it is, it has probably been introduced without the natural enemies that checked it in its original home; and it is due to the work of an Englishman, R. C. L. Perkins, that this principle was applied in the Sandwich Is. against the insect so seriously destructive to the sugar-cane crop, the Cane-leaf-hopper (*Perkinsiella saccharicida*). Its natural home is Australia. Study of the insect there showed it to be kept in check by a variety of insects, some of which were introduced to the Sandwich Is., eventually reducing the insect to the status of an ordinary insect, not a pest. This principle has been followed in other cases, notably the Fluted Scale of Orange (*Icerya purchasi*), the Gipsy Moth in the United States (*Porthetria dispar*), the Brown-tail Moth (*Euproctis chrysorhoea*) in the United States, the Sugar-cane Cockchafer of Mauritius (*Phytalus Smithii*); it is the natural principle to proceed upon in the case of introduced insects and it has been developed especially in the United States, which owes to importation so many of its principal pests.

In other cases the disturbance and consequent occurrence of pests is due to violent alterations in the proportions of the crops grown. Where there has been, as in England, a fairly uniform mixed cultivation of many crops over a long period, a balance of life has been established as under natural conditions; but where the variations in supply cause fluctuations in prices and large areas are put under other crops, this balance is disturbed, and there are waves of insect pests; naturally this manifests itself far more quickly under tropical conditions, where there are several broods of an insect a year, than under temperate conditions, where there is only one brood a year with a long resting period, and it is partly this factor which makes for the very great loss from insect pests in the tropics.

Having obtained any data as to the factors producing an outbreak, it is to be seen whether there is any way of quickly restoring the balance of life, or of so modifying cultural practice as to avoid the outbreak, and it is to this that the entomologists' attention is specially directed. The nature of the rotation of crops, the time of sowing, the use of early or late maturing varieties, these are important points; a further point is on what food plants or under what conditions the insect spends the time when the crop is not on the ground or is not fruiting, and modern entomology emphasizes more definitely the value of the old maxim of clean cultivation, of growing only crops, with nothing on the land besides—no weeds, no alternative food plants, no "volunteer" plants. This is particularly the case with permanent cultivation such as fruit or such tropical crops as tea, coffee, cacao, rubber and the like.

A point of great interest, which has as yet been scarcely touched, is that of "immunity," whether natural or induced. The discovery that American vine stocks were immune to Phylloxera, since they had always been exposed to it in America, whence Phylloxera came, did much to save the European vine industry; there are stocks of apple which are apparently immune to the root forms of woolly aphis (*Schizoneura lanigera*); vigorous plants growing under good conditions are frequently "immune" to attacks of such sucking insects as Leaf-hoppers (*Jassidae*), Scale Insects (*Coccidae*), *Psyllidae* and White Fly (*Aleurodes*). This question is far more developed in the case of Fungi (*e.g.* rust in wheat) than in that of insects; but it is a question which has come more definitely to the front during the past few years. It is not at present possible to induce immunity, but it may soon be possible to do so.

The fourth point in the entomologists' plan is that of the utilization of direct remedies, such as insecticides, fumigants, and soil insecticides. There was a considerable modification in opinion during 1910–20, and but for the large propaganda by insecticide firms, the use of these artificial methods would have considerably declined. In the actual practice of spraying there have been few improvements and no radical changes. The arsenates, nicotin, lime, sulphur, soaps, these are still the principal insecticides; heavy oil emulsions have replaced paraffin, and the present tendency is to seek farther afield for new and more toxic substances. But progress has been small, there has been little systematic investigation, and there are only differences in detail in the use of insecticides and spraying-machines.

A feature of the development of the subject has been the broadening of knowledge among farmers, fruit-growers and even the general public, particularly in the United States, but also in Europe. In England, publicity and propaganda campaigns have been mainly concerned with the house fly, and there is still great ignorance about other pests; but this is passing with the increase of nature-study and the greater development of natural-history societies in schools.

Legislation.—Experience of the value of legislation in regard to the spread of plant pests and to their destruction has resulted in a very definite simplification of the laws and enactments relating to insect pests, and a conference of delegates of 26 nations in Feb. 1914 at Rome formulated the Rome convention, which still further simplifies the principles governing the regulation of plant traffic from country to country.

Almost every country now seeks to protect itself against new pests, which, introduced without natural checks, become immensely active and destructive in a new habitat. These measures were very varied and are now simpler, and when a convention is established finally, it will probably rely upon one definite principle; but there is still some variety. Countries seek to protect themselves by prohibiting the import of plants from a specified locality, of specified plants, of anything likely to cause disease, of insects, or of packing with infested articles; so, for instance, a sugar-growing country prohibits the importation of canes, and also, perhaps, of all plants from an area in which a virulent insect pest is active.

An alternative is to permit importation under conditions; ports of entry may be designated at which alone plants come in, the plant imports may be limited to special times, or must be in new packages, or only in postal packets. The most general condition is inspection on arrival by a competent officer, who may order their destruction if infested with a pest, or the plants must be fumigated on arrival, this being done usually with hydrocyanic-acid gas generated from potassium cyanide and sulphuric acid, the amount used being about 2 oz. cyanide per 100 cub. ft. space for half an hour.

Formerly great stress was laid on the value of quarantine; all plant imports were grown in a quarantine ground under the supervision of a Government botanist until it was certain that they had no disease. The objection was that if the plant was diseased the disease was brought into the country and, whatever the supervision of the botanist, might get loose and spread; an alternative to quarantine was "following up"; the importer notified the arrival of plants and the exact spot where he planted them; an inspector saw them at intervals in order to destroy them if any disease developed.

A more recent principle is that of admitting plants without delay if they were accompanied by a certificate that they had been inspected by an official of the Agricultural Department of the exporting country, and were declared free of pests scheduled by the importing country, or that they had been grown in an area declared free of the scheduled pest. The latter applied particularly to *Phylloxera* of vine; the former applies to the schedule of pests drawn up in each country, and this is the principle accepted by the Rome convention of 1914. Each country is to draw up a schedule of pests which are not epidemic in that country but which are recognized pests, and any country sending plants will have an adequate service of trained inspectors to give certificates that either the nursery sending the plants, or the actual consignment, is free of pests. This cannot be done without a "Phytopathological Service," so that the consenting countries bound themselves to create this, and this has to some extent been done in Great Britain, France, Italy, Holland, Belgium. The United States refused even to discuss the question, and has adopted drastic inspection and certificates of freedom from pests, but experience has shown it that few certificates are reliable and it is not willing to receive consignments from any country whose certificates are not really of established value (*e.g.* those of Holland are accepted).

A further difficulty is that plants may come from countries not able to give certificates, *e.g.* Tibet, and these plants are very liable to introduce disease. Inspection on arrival is the usual method but an effort has been made to enable such plants to be grown under quarantine when imported by a firm of established reputation in Great Britain, so as to avoid the risks of unpacking at the port.

Internal legislation, prescribing action on the part of growers, has made progress during recent years, and has been very much simplified. In Great Britain the sale-of-diseased-plants order of 1921 puts a penalty on the sale of plants "substantially attacked"

by a number of common insects and fungi. The actual enforcement of the order generally would require the services of many thousands of officials, and would be impossible, but it is designed to give powers to the Ministry of Agriculture to proceed against any nursery notorious for distributing diseased plants, and also to enable the Ministry to act freely in case of a new pest being introduced.

In America and the British Dominions such legislation is common. It prohibits the possession of diseased plants, the sale of infested plants, the sale of plants from an infested area, the removal from declared areas of plants, cases, bags, packages, earth, manure and even of persons; it is often aimed entirely at nurseries and seeks to control the distribution of plants; nurseries must be registered, must be inspected at fixed intervals, must send out certificates of inspection with all consignments, and may, if infested with a scheduled pest, be quarantined; and there are the usual provisions as to entry, to prescribing remedies, to penalties for non-compliance. The treatments of infested plants by the owner or by the State are prescribed, or the destruction, isolation or confiscation of infested plants. Further provisions are to compel destruction of insect breeding-places, and to prohibit the planting in infested land or within a certain distance of infested land.

In many countries, as in Great Britain, the occupier of land has to notify the occurrence of any of the scheduled pests to the Ministry of Agriculture and in some tropical countries there is a specific prohibition of the practice of driving locusts to one's neighbour's land. The tendency is to rely less on legislation, compulsion and penalties, and to move more towards education and reason. The spirit which enabled a Government to close all schools, courts, places of business, etc., while a whole province fought locusts, exists only in the least civilized areas of the earth, and the campaign against pests is carried on by propaganda, education and the arousing of public spirit.

Insects and Crops.—The importance of insect attacks as factors in the growth of crops varies from the case of cotton, where the insect is a dominant factor, equal in value to soil and climate, to that of rubber, where as yet scarcely any serious insect pest has arisen, certainly none equivalent to the fungoid diseases.

Cotton was formerly produced mainly in the southern United States. There the bollworm was the chief pest, causing loss that now averages some £2,500,000 annually, but in 1894 the Boll Weevil appeared in Texas, and in 1905 Dr. L. O. Howard, Chief of the Entomological Bureau of the United States Department of Agriculture, wrote:—"The Mexican Cotton Boll Weevil has the unique record of developing in less than 20 years from a most obscure species to undoubtedly one of the most important economically in the world. There was a hope that the increase in cotton in the United States would keep pace with the world's demands; now the weevil has rendered this impossible."

The damage is now averaged at about £5,000,000 annually. But there is worse to come. Another pest has been known in India since 1844; this is the Pink Bollworm, which reached Egypt between 1903 and 1910. There they already had another bollworm; but by 1917 the Pink Bollworm was destroying on the average 17% of the crop, causing a loss of £8,000,000 a year, and this pest reached Texas in 1917. In spite of the efforts of the U.S. Department of Agriculture it was established there in 1921, and in a few years it seems likely to destroy 2,000,000 bales, worth, say, £60,000,000.

Nor are these the only pests of first-rate importance. In India the Spotted Bollworm is a pest which also attacks Egyptian cotton. In 1905 this pest almost entirely destroyed the cotton crop of the Punjab and Sind, and it was known in 1921 only in India, Egypt, the Sudan and British East Africa.

The chief cotton-producing countries are listed here with the pests they have; what if the pests spread to all? The output is that of 1917:—

	Acres	*Bales*	*Pests*
United States of America .	33,841,000	11,302,375	H.A.P.E.
India	24,781,000	3,228,800	H.E.
Egypt	1,761,000	1,287,000	P.E.
China		830,000	
Russia	(840,000)	578,000	
Brazil		400,000	A.P.
Mexico		125,000	A.P.
Peru.		110,000	
Indo-China		20,000	P.
Corea		200,000	
Nigeria		2,621	P.
Nyasaland		4,448	H.E.
Uganda		20,000	E.
West Indies		3,000	P.H.

H—*Heliothis armigera*, the American Bollworm—It attacks cotton in America but, while it occurs universally in the tropics, does not, in India, attack any cotton but Cambodia.

A—*Anthonomus grandis*—Mexican Boll Weevil.

P—*Platyedra (Gelechia) gossypiella*—Pink Bollworm.

E—*Earias insulana*—Spotted Bollworm.

Apart from cotton, the actual limiting effect of insect pests is less definite but it is a notable factor in many tropical crops: sugar-cane suffers heavily from two pests, moth-borers and cane-leaf-hoppers; the loss from one species alone is, in Barbados, estimated at over 15%. With sugar selling at £15 per ton, this means a loss of £6 per acre, and this loss is avoidable by a small expenditure; but the crop is grown, the expenses of rent, management, cultivation, manuring, harvesting, manufacturing are all incurred, on canes diseased and affected by this pest, and the net result is a decreased yield, expenses being still the same, of some £6 per acre.

A similar situation occurs with nearly all crops, but it is difficult to say definitely what proportion of the loss is due to insects. In England, Green Fly may ruin the hops, frequently ruins the plum crop; in America a long cold spring gives the Spring Grain aphis scope to increase, and decreases the yield of wheat and reacts on every wheat sale in the world, or a wet summer destroys Chinch Bug, and the wheat crop increases next year with bigger supplies and lower prices. Of the many factors influencing wheat prices, insects are only a small one, but they may be, in some years, just the determining factor, since the factors of climate, rainfall, weather, production, transport, speculation may all be steady.

Stock Raising, Building and Grain Storage.—Insects are not only factors in crop production but in stock raising, in building protection, and in grain storage. The best example of the first is in the Blowfly pest of sheep in Europe, Australia, S. Africa, Argentina and other places. The loss of stock in Australia in 1916 amounted to £3,000,000, and the production of wool and meat in Australia will depend very much on whether control is obtained over this pest. In 1921 no real effort had been made to control it; but it will eventually be controlled, probably by the introduction of natural enemies and by the employment of substances protecting the animal from attack.

The importance of insects in buildings in Great Britain has been emphasized by the discovery that the glorious timber roof of Westminster Hall was in a dangerous condition owing to the attacks of the Death Watch (*Xestobium rufovillosum*, or *tesselatum*). It was found that the timbers were destroyed to a very remarkable extent, and H.M. Office of Works embarked on a scheme of strengthening the roof with an invisible steel frame while preserving intact as much of the timber as possible. It was essential not only to stop the activity of insects but to protect the timber from further infestation, and the solution was found in a treatment by which all infested timber is freed of the pest by dichlorbenzene, and all surfaces are impregnated with a coat of soap, paraffin wax and cedar-wood oil, which prevents further insect attack. This method has been applied to other buildings, notably St. Paul's Cathedral.

A war problem of importance in which entomology was concerned was connected with the preservation of the accumulated wheat stocks in Australia. In 1917 there was a stock of some three million tons of wheat in bags in Australia, with another similar amount to be harvested. All was stored in the open, since no other storage was possible, the wheat usually being shipped immediately, and the result of storage under bad conditions was an immense infestation by weevil (*Calandra oryzae*), threatening the complete loss of a stock of wheat urgently required for the Allied countries. Two problems needed to be solved, the storage of wheat and the freeing from weevils of the already infested wheat harvested in 1916 and 1917 and then awaiting shipment. Since the Australian Government were unable to deal with this problem it was necessary for the British Wheat Commission to undertake it, and the solution was found in a method of storage which prevented access of weevil and in a treatment by heat on a large scale, so that in a single plant 1,000 bus. per hour were heated for three minutes to 140°F., killing all stages of the weevil and giving a weevil-free wheat suitable for milling and baking. This treatment cost less than one penny per bus. and enabled Australia to ship 200,000,000 bus. of wheat which was otherwise becoming totally unsalable or unusable. (H. M. L.)

ECUADOR (*see* 8.910).—The population of Ecuador was not altered much during the period 1910–20. Immigration was very slight. No census had been taken. In 1920, an official estimate gave the pop. as 1,500,000.

Government.—In a message to Congress in 1914 President Plaza G. raised the question whether or not presidential government in Ecuador had met the test of experience. Upon that subject he held conferences with the members of a special committee of the Chamber of Deputies and hoped that, as a result of its report, a joint committee from both Houses of Congress would be appointed to draw up a project for the reform of the constitution of 1906. The Senate, however, did not favour this action. President Plaza G. again mentioned the urgent need of constitutional reform in his message to Congress of Aug. 10 1915. Upon the following day he addressed a special message to Congress proposing the political reorganization of Ecuador by the introduction of the parliamentary system. Annexed to his message were certain proposed amendments of Ecuador's fundamental law which were framed to accomplish this end.

These, however, were not accepted by Congress. On June 28 1917, President Baquerizo M. promulgated a decree regulating the duties of his Cabinet. The Minister of the Interior was to be charged with internal administration, municipalities, police, prisons, houses of correction, public works, railways, sanitation, concessions, and with government of the province of Oriente and the Galápagos Islands. The Minister of Foreign Relations was to have direction of international affairs, consuls, post-offices, telegraphs, telephones, immigration, and colonization. The Minister of Public Instruction was to be charged with public instruction, statistics and civil registry, fine arts, theatres, charity, justice, religion, agriculture, improvements and national forests. The Minister of Finance was to supervise the collection of the national revenues, the auditing of accounts, public credit, the administration of national property, commerce, public lands and trade marks. The Minister of War and the Navy was to control the regular army, reserves, war vessels and lighthouses. By a decree of Sept. 22 1919, the control of the province of Oriente and the Galápagos Islands was transferred to the Minister of Foreign Relations.

Communications.—In recent years measures were taken by the national Government for the improvement of roads, most of which were merely trails or bridle-paths. Some internal traffic was carried on by the rivers, especially by the Guayas river and the tributaries of the Amazon. The most important railway was the Guayaquil and Quito railway, opened to traffic in 1908. To shorten the route between these two cities the Government planned a railway between San Juan Chico and Riobamba. Other short railways were projected, and in some cases partly completed. A contract was signed whereby a railway was to be built from Quito to Ibarra, thence to Tulcán, and to the coast in the province of Esmeraldas. Surveys were made and construction was begun on a section of the roadbed near Ibarra in Aug. 1917. Construction was begun also on a railway between Ambato and Curaray in Jan. 1913. By June 1918, the section between Ambato and Pelileo was practically completed. In 1914 work was begun on a railway between Huigra and Cuenca. After some preliminary surveys had been made the Government decided in Aug. 1915 to build it from Sibambe to Cuenca, and actual construction began the following month. A railway projected between Bahía and Quito had, by 1917, been built and opened as far as Chone. In 1913, one was completed between the seaport of Manta and Portoviejo, and by 1915 that road had been opened to Santa Ana. A short railway was begun in 1914 between Guayaquil and Salinas, and another was being constructed in 1920 between Babahoya and Guaranda. During a large portion of the year 1920 Ecuador was almost isolated from the world by sea; for, because of the prevalence of the bubonic plague and of yellow fever at Guayaquil, that port was avoided by large vessels. In April 1914, a radio station was officially opened at Quito and wireless communication was established with a small station in Guayaquil.

Sanitation.—Sanitary work was begun seriously when, in Dec. 1913, a contract was signed between the Ecuadorian Government and White & Co., of London, for the paving of Guayaquil and the instalment of a modern water system. A yellow-fever commission of the Rockefeller Foundation made a scientific study of Guayaquil in 1916. A fight against the fever was, however, postponed because of the World War. In 1918 squads of men under Col. Gorgas began a scientific attack upon the *stegomyia* mosquito in Ecuador. So successful was this campaign that, on May 27 1920, the director-general of public health at Guayaquil issued a statement that yellow fever had been eradicated from that city as well as from the towns in the provinces of Guyas, Los Rios, and El Oro, where it had been endemic.

Foreign Commerce.—There was some fluctuation in Ecuador's imports and exports from 1910 to 1918, but not much increase. Figures compiled by the Pan-American Union show that in 1913 the imports of Ecuador amounted to $8,836,689 U.S. currency; and that her exports in that year amounted to $15,789,367. In 1918 her imports amounted to $8,111,690, while her exports came to $13,364,774, in both cases a decrease. Her import and export trade with the United States had grown greatly at the expense of trade with European countries. In 1913 imports from the United States amounted to $2,817,754; in 1918 they aggregated $4,632,761. In 1913, out of a total export trade of $15,789,367 her exports to the United States came to $3,833,728, while in 1918 they amounted to $10,429,150. Among Ecuador's most important imports in 1918 were textiles (other than silk), food-stuffs, hardware, machinery, paper, and perfumes; while her most important exports were cacao, ivory nuts, Panama hats, coffee, gold and wool.

Army and Navy.—In 1917 the navy of Ecuador was composed of a destroyer, a cruiser, a coastguard vessel, a submarine, a launch, and a tender, with a small personnel. The territory of the republic had been divided into six military zones which were in charge of army officers. A general staff was in control of the regular army, made up of 10 battalions of infantry, two squadrons of cavalry, three regiments of artillery and a company of engineers. The regular army including officers, numbered 5,200.

Education.—Although by a law of Ecuador primary education was free and attendance compulsory, the percentage of illiteracy was high. In 1914 an Ecuadorian writer estimated that over 70% of children from 5 to 14 years of age were illiterate. In a message to Congress in Aug. 1915, the President stated that there were in Ecuador 1,054 primary schools with an attendance of 95,019 pupils. Secondary education was being conducted in 13 national *colegios* (academies) with 1,778 students. In addition there were schools for professional or technical training: normal schools, a school of agriculture, schools of arts and trades, a school of fine arts, and a national conservatory of music. Later commercial schools were founded in important cities. In 1916 and 1917 decrees were issued reorganizing the curricula of normal schools, of the school of arts and trades at Quito, and of the national military academy. In 1917 the President decreed the establishment at Quito of a museum of archaeology and of a national gallery of painting and sculpture. Higher education is carried on in universities at Cuenca, Guayaquil and Quito. The central university of Ecuador at Quito is composed of colleges of science, medicine and law. The younger universities at Guayaquil and Cuenca have colleges of law, medicine and pharmacy.

Finance.—In Ecuador's budget for 1914 the revenues and the expenditure were balanced at 20,441,955.92 sucres (nominal value $0.486 or one-tenth part of £1 sterling); the income for that year, however, amounted only to 16,913,768.97 sucres, while the expenditure came to 20,220,794.83 sucres. Revenues from import duties which were estimated at 10,883,055.02 sucres came only to 7,707,191.26 sucres. The end of the year left the Government with a deficit of 3,307,007.86 sucres. This deficit would have been larger but for certain economies and the postponement of some payments. In 1915, partly because of the decrease in import revenues due to the World War, Ecuador had to borrow 20,000,000 sucres from local banks. The Minister of Finance announced that on Dec. 31 1917, her domestic debt amounted to 34,001,651.04 sucres, while her foreign debt came to 18,923,508.10 sucres, making the total debt 52,925,159.14 sucres. Of the domestic debt 131,547.27 sucres and of the foreign debt 6,618,115.04 sucres were interest unpaid. The minister stated that up to Dec. 31 1917, the service of the foreign debt in interest and amortization was in arrears 10,710,276.55 sucres, because of the decrease in revenues.

History.—Gen. Eloy Alfaro's term as president expired Aug. 31 1911. On Aug. 12, however, he resigned the presidency and his resignation was accepted by Congress two days later. Emilio Estrada, who was elected in Jan. 1911, was inaugurated Aug. 31, but died Dec. 21 following. Dr. Carlos Freile Z., president of the Senate, who had served as chief executive upon the resignation of Alfaro, again assumed executive authority which he exercised until March 5 1912. Meantime a revolt, having as its object the overthrow of the legal Government and the establishment of Gen. Alfaro as supreme magistrate, was quelled. That leader was taken out of the penitentiary at Quito by the infuriated populace and killed in Jan. 1912. Acting President Freile Z. was succeeded by Dr. Francisco Andrade Marín, speaker of the Chamber of Deputies, who exercised presidential authority from March 6 to Aug. 10, when Dr. Alfredo Baquerizo M., president of the Senate, took the reins of power and served as president until Aug. 31 1912. Upon that day, as the result of a special election held in April, Gen. Leonidas Plaza G. was inaugurated as president for his second term. He selected Alfredo Baquerizo M. as his Minister for Foreign Affairs, who was succeeded by R. H. Elizalde. The first years of his administration were stormy, being marked by revolts and civil wars. Even after a troublesome insurgent leader, Gen. Carlos Concha Torres, was captured by Government soldiers in Feb. 1915, his followers were loath to lay down their arms. In elections held in Jan. 1916, Alfredo Baquerizo M., a Liberal, was elected president: he was inaugurated on Aug. 31. Various steps were taken by the President and Congress to lessen the economic and fiscal strain due to the World War. Embarrassing disputes arose between Ecuador and the Guayaquil & Quito Railway Co. about the execution of their engagements. On Aug. 31 1920, Dr. José L. Tamayo was inaugurated as president for the term to Sept. 1 1924.

International Relations.—Part of the territory claimed by both Ecuador and Peru has been occupied by Peruvians. Provision was made for the settlement of the boundary dispute between Ecuador and Colombia by a treaty signed at Bogotá July 15 1916. This treaty drew a boundary line between Ecuador and Colombia; it also stipulated that a mixed commission

should be appointed to place marks along that line where natural boundaries were not sufficient and to make such minor reciprocal compensations of territory as might be necessary to fix the boundary exactly. That commission began the delimitation of the Colombian-Ecuadorian frontier line about a year later, and it completed the task by July 1919.

The World War.—On Aug. 17 1914, the Ecuadorian Government issued a decree announcing that it would observe the strictest neutrality in the World War and stating that it would adhere to the Hague Convention of 1917 and to the general principles of international law. Soon afterwards France and England complained that Ecuador had permitted violations of neutrality, allowing German war vessels to use the Galápagos Is. as a naval base. On Nov. 21 1914, Minister Elizalde issued a justificatory circular to American chancelleries about the neutrality of his Government. Seven days later President Plaza G. issued a decree containing certain regulations that were to be observed by all neutral vessels reaching Ecuador. In Oct. 1917, when the ex-German minister to Peru, von Perl, who was also representative of his Government to Ecuador, expressed his intention to proceed from Lima to Quito, he was informed by the Ecuadorian minister at Lima that his reception by Ecuador would be incompatible with the principles of American solidarity. On Dec. 8 following, the Minister of Foreign Relations sent cablegrams to Ecuadorian legations stating that Ecuador had severed relations with Germany. As a party to the Treaty of Peace with Germany, Ecuador had the opportunity of becoming a member of the League of Nations. At the instance of its committee on foreign relations, on Nov. 1 1920 the Ecuadorian Senate postponed action upon the League until the next meeting of Congress.

EDINBURGH, Scotland (*see* 8.937*).—By the passage of the Edinburgh Boundaries Extension Act of 1920 Edinburgh has become, as far as area is concerned, the second largest city in the United Kingdom, through an amalgamation with Leith, and the absorption of the suburban districts of Liberton, Colinton, Corstorphine, and Cramond. The municipal area was increased from 10,597 to 32,402 acres.

The number of municipal wards has been increased from 16 to 23 and the number of members of the town council from 50 to 71—three representatives of each ward in addition to the two *ex officio* members, the dean of guild and the convener of the trades. The four Leith wards form the parliamentary division of Leith, and the four new suburban wards are in the northern division of Midlothian and Peebles. The powers of the board of trustees under the Edinburgh Waterworks Acts of 1869, 1874, and 1896 and of the Edinburgh and Leith corporations gas commissioners are now exercised by the town council. The total valuation, as extended, is £4,696,504.

The pop. of Edinburgh by the 1911 census was 320,315, of Leith 80,488, of Liberton 8,360, of Colinton 6,664, of Corstorphine 3,870, and of Cramond 3,763—a total of 423,460 for the extended city. The estimated pop. in 1920 was 450,000. In 1917, the corporation agreed to purchase the plant of the Edinburgh Tramway Co., for £50,000, and the transfer took place in July 1919, at the expiry of the company's lease. The work of replacing the system of cable cars was begun in 1910. A tramway extension to South Queensferry and Port Edgar was sanctioned by the town council in 1917. The most important addition to the public parks was the establishment by the Zoölogical Society of Scotland, in conjunction with the town council, of a zoölogical park at Corstorphine hill, which was opened in July 1913. The site, which extends to 74 ac., was purchased by the town council and feued to the society. About 27 ac. have been laid out in a manner designed to give expression to the latest ideas about the acclimatization and exhibition of wild animals, and to show the inmates living under conditions which invite them to display their normal instincts and habits The park contains a large and varied collection. and when completed will rival the London "Zoo." Large corporation markets and slaughter-houses were opened in 1910, and in March 1914 the Usher hall, bequeathed to the city in 1898 by Mr. Andrew Usher, was completed and opened.

Additions to the large number of public memorials in the city include a Black Watch memorial (1910), a statue of Dr. Guthrie (1910), a life-size statue of Thomas Carlyle (by Boehm) presented to the National gallery by Lord Rosebery in 1916, and a Gladstone memorial (1917). In 1913, Lord Rosebery presented to the city the historic house in the Lawnmarket known as Lady Stair's house; and in 1920, the birthplace of Robert Louis Stevenson, 8, Howard Place, was purchased as a memorial by the R. L. Stevenson club. In 1911, the King and Queen dedicated the new chapel of the Order of the Thistle, in St. Giles' cathedral. The new Freemasons' hall was opened in the same year. The western spires of St. Mary's cathedral (carrying out the original plan of Sir Gilbert Scott) were completed and dedicated in 1915 and 1917. Reconstructions of the national museum of antiquities and of the national portrait gallery were in progress in 1920, and a scheme for a national war memorial provided for the utilization for this purpose of Edinburgh castle, which was to be disused as barracks.

Royal residence at Holyrood had emphasized the social position of Edinburgh as the capital of Scotland, and its importance as an administrative centre tended rather to increase than to diminish, as new government departments were established. Its commercial importance depends upon its being the headquarters of many of the Scottish banks and insurance companies and of the North British Railway Co., upon the continuance of its traditional position as the chief centre for the administration of Scottish landed estates and upon its preëminence in the legal world. Apart from the business of the high courts, Edinburgh firms of writers and chartered accountants are entrusted with a large proportion of Scottish legal and administrative work.

During the World War the proximity of Edinburgh to Queensferry and Port Edgar and the great battle cruiser and destroyer base in the Firth of Forth gave it strategic importance in the naval operations, and its position as the headquarters of the Scottish command made it a centre of military organization. Preparations for defence against an invasion by sea were made in its vicinity as in other coastal districts, but no serious anti-aircraft protection was given until after a Zeppelin raid, on April 2 1916, in which ten people were killed and eleven seriously injured and damage was done to warehouses, private houses, and public buildings including Donaldson's hospital. In the later stages of the war Edinburgh became a favourite leave centre for colonial and American troops.

EDISON, THOMAS ALVA (1847–), American inventor (*see* 8.946), made great progress after 1910 in perfecting a battery of large storage capacity for propelling vehicles. This proved of great service, for example, in moving baggage trucks at railway stations. He hoped to produce, with Henry Ford, an automobile so propelled. He was specially interested in the cinema, and early in 1913 displayed the first talking pictures, produced by synchronizing the motion-picture and the phonograph. Although as yet unperfected, the inventor believed that such pictures were destined largely to replace text-books in the schools. On the outbreak of the World War he urged "potential preparedness" through mobilizing facilities for research in America, on the ground that "future soldiers will be machinists." In 1915 he was awarded a Nobel prize for physics and the same year was made president of the Naval Consulting Board. After America's entrance into the World War he was in charge of several plants manufacturing chemicals used in warfare. In 1916 he announced a portable searchlight, fed by a storage battery, far more powerful than the acetylene lamp, for use amid smoke in mine rescues, train wrecks, etc.

EDMONTON, the capital of the province of Alberta, Canada (*see* 8.946), first established as a trading post by the Hudson Bay Co. in 1795, remained little more than a village until 1901. Since then its growth has been rapid, and in 1920 it had a pop. of 67,000. Edmonton has 5 railways with 13 radiating lines, and is the terminus of the Calgary and Edmonton branch of the Canadian Pacific Railway. The city council consists of a mayor and 10 aldermen elected from the city at large—the mayor for one year and aldermen for two—and the mayor and two commissioners act as a board for administration. There is also an elected board of six public school trustees, and another elected board of trustees for the separate (Roman Catholic) schools. The Supreme Court sits at Edmonton several times a year. Edmonton

****These figures indicate the volume and page number of the previous article.***

is the chief educational centre of the province, and besides the university of Alberta has a branch of the Normal school, Alberta College, Westminster Ladies' College and a Presbyterian college.

Edmonton has extensive live-stock, dairy, milling and packing industries. There are 9 coal mines within the city limits and 24 on the outskirts, giving a yearly output of 1,680,000 tons. Gold, silver and oil are also found in the neighbourhood.

EDMUNDS, GEORGE FRANKLIN (1828–1919), American lawyer and political leader (*see* 8.949), died in Pasadena, Cal., Feb. 27 1919.

EDUCATION (*see* 8.951).—In the sections on Education, in the articles on various countries, mention is made of the progress made there during 1910–20. Here a general account is given of progress in the United Kingdom and the United States.

(1) United Kingdom

The first two decades in the 20th century opened a new era in the history of education in the United Kingdom. In England and Wales the Act of 1902 not only combined in a national system of elementary education both voluntary and state schools, but laid a wider foundation for a national system of secondary education. It was an Act which represented the spirit of compromise. It gave a new expression in one most important group of institutions to the English genius of harmonizing diverse elements within the State. At the same time the Act marked a great experiment in local government, by transferring the responsibilities for education, elementary and secondary, from the *ad hoc* school boards in England and Wales to the municipal and county councils, and bringing education thereby into closer relations with the other sides of civic policy.

It is necessary to the understanding of the development of English education between 1910 and 1920 to keep in view this fundamental change at the beginning of the century. For during these first 10 years the system of education was taking on a new character, which reflects a wider conception of education. The school becomes more publicly recognized as a great centre of social influence. Provision is made by statute to secure in necessitous cases that school children shall be properly fed. Inspection of the health of school children becomes a responsibility of the local education authorities. Increased attention is directed to the special problems of physically and mentally defective children. The care also for the leisure hours of the child and the provision of play centres become part of school life; and the creation of juvenile employment organizations, in connexion with the school, express the continuity of the elementary school with the after life and care of the child. Side by side with these developments there can also be observed a remarkable growth of corporate life amongst school children themselves, and of voluntary organization of social workers, anxious to help in the ways of the juvenile community. It is not too much to say that a broader human outlook marks English and Welsh elementary education in the first 20 years of the 20th century. And this is no less true of education in Scotland.

Meanwhile, a deeper sense of the need for secondary and continuation education was also awakened. The growth in the number and variety of continuation classes under the local education authorities, the rise of the Workers' Educational Assn. and of the university tutorial classes system are all signs of the new order in education. What this means in progress can only be realized by looking backward and reflecting how modern is the growth of the system of English public education. When the mind follows the story of education in England from 1831, when first small grant was made by Parliament for public education, the opening decades of the 20th century stand out above all as calling into consciousness a deeper and wider idea of national public education.

The second decade of the 20th century marks in a very peculiar degree the continuation and working out of the movements which had manifested themselves in the preceding 10 years. The great Act of 1918, with the corresponding Education (Scotland) Act, extended and deepened the work of the 1902 Act in England and Wales and of the 1908 Act in Scotland. The principles of organization and the ideas of the relationships between the school and society, developed in the legislation and administration of the period 1907 to 1910, were being progressively carried out in the years immediately following. But the second decade of the 20th century is broken and deeply affected by the years of war. In these 10 years three periods may be distinguished. The first from 1910 to the outbreak of war in 1914; the second from 1914 to the Armistice period in 1918; the third from 1918 onwards, the opening of the period of reconstruction and reaction. The first period, from 1910 to 1914, was marked by the steady progress of the new order. The sectarian controversy which had raged round the Act of 1902 had subsided; a wider and deeper conception of educational relationships was growing steadily with a more general acknowledgment of the truth, that national education in England must combine a wide variety of opinions and a large freedom of curriculum. There was a new spirit of tolerance. The administrative authorities, central and local, had set themselves seriously to carry forward the extension upwards of the educational structure on the basis of the 1902 settlement. These are years of steady progress and widening outlook.

The second period is that of four years of war, a period in which there was much less check to the continuous work of school education than might have been expected. But necessarily the schools suffered by reason of the war. The young male teachers went off on service, many school buildings were required for military and emergency purposes, the restrictions as to the employment of children were relaxed. Yet the war gave a new impulse to school life. Examples of service and sacrifice were present to the mind. There was a strain and seriousness which affected both teachers and scholars, and gradually, too, there came to the nation a fresh realization of the value of education in developing individual and national life. Already in the early years of the war expression was given to the demand for a wider and fuller system of national education, and steps were taken for the systematic consideration of the problem of "continuation education" and later of "adult education." Before the conclusion of hostilities the Departmental Committee on "Juvenile Education in Relation to Employment after the War" had presented its report and the Minister for Education had framed, and Parliament approved, a measure which ranks with the great Acts of 1870 and 1902. Moreover the army itself had become a great school or university and the experiments carried out with the forces at home and overseas in adult education were fruitful in stimulating new ideas as regards the scope and method of national education and in directing attention to the place which education should have in the life of men engaged in the military and naval services.

The third period from the Armistice onwards, presents, in less than three years, marked contrasts. In the first enthusiasm for reconstruction there was a vigorous forward movement with the view of bringing into operation as rapidly as possible the provisions of the 1918 Acts. It was more than a period of reconstruction; it was a time of new national ideals. Then came the ebb, with economic pressure, industrial unrest, high costs of construction and equipment, and financial stringency, and the larger educational programme has been temporarily suspended. In the grey morning of reparation and economic reconstruction after a World War education had suffered, and there was some receding of the high hopes and feelings. But the check could only be regarded as temporary, and the ideas born in war and in the early days of peace were in 1921 already reasserting themselves.

In considering the period from 1910 onwards it must also be borne in mind that the educational movement has been increasingly closely interwoven with other developments. Thus the public library organization in the years immediately preceding the war was being linked more closely than before with the educational system. It must also be remembered that already before the war a stronger national spirit had been evincing itself in education in the several parts of the United Kingdom. England, Wales, Scotland, Ireland, each was shaping on its own lines its national system, and the comparison of the development in the several states is rich in instruction for the student of mod-

ern education. But while there has been an increasing measure of administrative devolution in education the main lines of progress are common to all parts of Great Britain, though to a less extent to Ireland. England, which had been in the past more backward in its general education provision of elementary and secondary education than Scotland or Wales, has perhaps shown a greater advance during these years than any other part of the United Kingdom, and has not only led the movement for an obligatory system of continuation education to the age of 18, but has opened a wider vision of adult civic education and culture.

Education in England.—When the position of education in England was reviewed at the opening of the second decade of the 20th century, it could be seen that the system established by the Act of 1902 had become firmly established. That Act had done three noteworthy things. First, it had abolished the school boards and transferred their powers as regards education to the county and municipal councils. Secondly, it brought the voluntary elementary schools under the local education authority and assisted them by support from local rates, while leaving them a large measure of control in management. Thirdly, it had given the new local education authorities power to provide for schemes of secondary education and to levy rates for this purpose. Since 1902 there had been no important change in the constitutional machinery of the educational system in England. The Act of 1918 in England called into being no new order of local education authorities, as had been done by the corresponding Act in Scotland. In 1921 there were in England nearly three hundred local education authorities, with powers of making schemes and levying rates, standing in direct relation to the Board of Education, whereas in Scotland the number of local education authorities had by the Education Act (Scotland), 1918, been reduced to under 40. The consolidating movement had, therefore, progressed much further in Scotland than in England.

As regards elementary education, already in 1910 the system in England had become well established. Attendance at school was required up to the age of 13, and by the Act of 1918 is obligatory on all up to the age of 14. The average attendance has varied from 86% to 89%. Apart from the abnormal period of the war there has been a gradual diminution in granting of exemptions from school, and the Act of 1918 abolishes whole or partial exemption under 14 years. There has been little change in the number of public elementary schools in England. In 1903 there were 18,487, and in 1919–20 their number was 19,070. But there has been a considerable change since the Act of 1902 in the number of council and voluntary schools respectively. Since 1903 the number of voluntary schools has fallen from 13,438 to 11,635, whereas the council schools have increased in number from 5,049 to 7,435 in 1920. The total average attendance of pupils in public elementary schools in England, in 1920, was 4,795,672. In respect of the provision of teachers the period also shows relatively little change, but gradual improvement. The number of teachers, per 1,000 pupils in average attendance, in 1910–11, was 30·9, of whom 19·01 were certificated, 8·10 were uncertificated, and 2·98 other adult teachers. In 1919–20 the number of teachers per 1,000 scholars was 30·4, of whom 21·8 were certificated, 6·3 uncertificated, and 2·3 other adult teachers. In certain other matters, however, there had been very marked advance. In the years 1907–10 steps had been taken to secure to the local education authorities in England and Wales powers to establish medical inspection, to provide meals for school children where this was considered desirable, and to organize information in coöperation with the labour exchanges for the guidance of children in the choice of employment on leaving school. Provision had also been extended for the purpose of dealing with the mentally and physically deficient and a much wider recognition was secured for "after care" work among school children. A wider conception of the school and its responsibilities was thus steadily emerging. The Act of 1918 has carried the movement forward and has converted these powers of local education authorities into a duty to look after the health and physical condition of the children in public elementary schools. A system of school health services providing not only medical inspection, but also treatment, is now well on the road to accomplishment. Again, as regards the physically and mentally defective and epileptic children, the Act of 1918 requires that the local education authorities shall ascertain what children in their areas are thus afflicted and shall make provision for their education. It is also worthy of note that the Act of 1918 lays particular emphasis on the great importance of healthy recreation. The Act enables local education authorities, with the approval of the Board of Education, to supply, or maintain, or aid (*a*) holiday or school camps—especially for young persons attending continuation schools, (*b*) centres and equipment for physical training, playing fields, school swimming-baths, (*c*) other facilities for social and physical training in the day and evening. A very large proportion of the proposals already submitted have been concerned with holiday and school camps. In this connexion it may be noted that the 1918 Act specially encourages local education authorities to avail themselves of voluntary services, particularly in the development of the recreative side of school life, and the work of the Juvenile Organizations Committee in promoting healthy recreation is a sign of the new spirit which is now steadily pervading the educational system. Thus with the great development in State action, the sphere of voluntary action is also increasing. The ideal education policy requires voluntary and state agencies acting in close coöperation.

Secondary education in England presents a very different situation. It might almost be said that, until the opening of the 20th century, there was no national system of secondary education in England. The number of secondary schools, apart from the residential public schools and the old grammar schools, were few and the gateway from the elementary schools was very narrow. But the Report of the Royal Commission on Secondary Education in 1895, the Education Act of 1902, and the Regulations for Secondary Education in 1907, are stages in the foundation work of a new order, and during 1910–20 considerable progress was achieved in building up the framework of a national system of secondary education. The great public schools and grammar schools which have been so distinguished a feature of English higher education retain their independence and their well-deserved prestige. Like the ancient residential universities of Oxford and Cambridge, their position has been strengthened rather than weakened by the growth of new institutions. But the public schools (as the term is understood in England, meaning Eton, Harrow, and so forth) can only supply education to a very limited number and at a high cost, while there is a steadily increasing demand that there shall be easy provision of secondary education for all children who are willing and able to avail themselves of it. By 1911 there were 862 secondary schools on the Board of Education grant list, with 141,000 pupils; in 1920 there were 1,021 schools, with 282,005 pupils. There were also in 1911 96 secondary schools recognized as efficient but not on the grant-earning list, with over 17,000 pupils—while in 1920 there were 201 of these schools with 36,271 pupils. In the case of the schools on the grant list normally 25% of the places must be free; the actual proportion was considerably higher.

In considering however such figures of secondary education a caution is necessary. By far the greater number of pupils attending these schools are under 16 years of age. In the session 1919–20, out of the total of 282,005 pupils in the secondary schools 83,386 were under 12 years of age, 177,988 were of 12 and under 16 years, while only 20,631 were 16 years of age and over. Thus for all except a very small percentage, secondary education ends before 16 years of age. When it is recalled that there are close on 5 million children in the public elementary schools of England, and that the number leaving the elementary schools each year must be close on 600,000, it is evident how restricted the national provision of secondary education still remains. This in itself emphasizes the importance of the step taken in 1918 to provide obligatory continuation education. It is the case that in England the demand for secondary education has considerably exceeded the supply, but it is also true that the pressure of economic circumstances and the tradition of getting to work early will prevent a very large number of children in the elementary schools from

continuing or desiring to continue as full-time secondary school pupils. For the immediate future, therefore, a general system of continuation schools is the best hope of imparting the benefits of higher education to the majority of young people.

Already for many years local education authorities have been providing increased facilities for evening students—especially in technical and manual instruction. The circumstances of the war, however, stimulated greatly the public sense of the value of a much more complete system of continuation education, and brought into relief the defects of this side of educational organization when compared with the system of continuation education in Germany. Accordingly in 1916 the Minister of Education (Mr. Arthur Henderson) appointed a Departmental Committee on Juvenile Education in relation to Employment after the War. This committee submitted in its final report, in 1917, recommendations which the then Minister of Education (Mr. H. A. L. Fisher) largely embodied in a bill. Modified in certain particulars, this bill became the Education Act of 1918.

The Education Act of 1918 is, however, much more than a measure establishing an obligatory system of continuation education. It affects the whole scheme of elementary, secondary, and continuation education. It aims at the establishment of a "national system of public education available for all persons capable of profiting thereby," and local education authorities have, under the first section of the Act, been called upon to prepare schemes setting out the provisions which they have made and propose to make towards this great end. The Act makes important specific changes in respect of elementary education, including the provision of "nursery" schools for children between 2 and 5 years, the raising of the compulsory school age to 14, with power to the local education authority, by by-law, to extend the compulsory age to 15, the abolition of part-time attendance, the provision of central schools and special classes of more advanced and more practical instruction for the older and more intelligent children in the elementary schools, and it emphasizes the social welfare side of education.

In respect of secondary education, the Act requires local education authorities to coöperate in providing for the purposes of Part 2 of the Education Act of 1902 (*i.e.* higher education), particularly in respect of (1) the preparation of children for further education in schools other than elementary, and their transference at suitable ages to such schools, and (2) the supply and training of teachers. Also the very important duties and powers with reference to provision for medical inspection and treatment of children in elementary schools are extended by the Act to secondary and continuation schools. The Act removes the limitation, under section 2 of the Education Act of 1902, on the amount to be raised by the council of a county out of rates for the purpose of education other then elementary. The Act of 1918 is thus built on the foundations of the Act of 1902 and does much to complete the educational ladder.

But important as are these provisions, the main feature of the Act of 1918 is the institution of a compulsory system of part-time continuation education after the close of the elementary school period. "Young persons," between the ages of 14 and 18, are required to attend a continuation school for 320 hours a year—unless able to claim exemption under the Act. This is the cardinal fact of the new Act. For the first period of seven years compulsory attendance applies only to pupils between the ages of 14 and 16 years and a local education committee may reduce the number of hours' attendance to 280—modifications which give time to the authorities to make provision of schools and teachers wherewith to meet the new situation. Owing, however, to contingencies, mainly financial, the operations of the Act have to a considerable extent been postponed. But these difficulties are temporary, and the experience of a national system of part-time work and part-time education will presently begin to furnish instructive evidence on the value of secondary education and continuation education respectively. It is a matter which merits the most careful observation in the next period.

In connexion with this very important subject it should be stated that in the session 1918–9, 125,000 students were in attendance at technical and special schools in England, while the number attending evening schools, chiefly under the local education authorities, exceeded 465,000. Attention should also be directed to the very notable and encouraging growth of classes under the Workers' Educational Association and the university tutorial classes. England has been the home of this development, which is one of the most significant and encouraging signs of the times. In 1918–9 there were 87 one-year classes organized by the Workers' Educational Association and 132 tutorial classes which are three-year courses. In 1919–20, the number of one-year courses had increased to 159 and of three-year courses to 182. These classes have been concerned mainly with economic history and theory, political and social science, history, literature, and in some cases philosophy. Summer schools are now held at many of the universities, for students from the tutorial classes. The growth of the movement opens out a new vista for democratic education in and from England.

Education in Wales.—In considering the development of education in Wales, it will be remembered that while English and Welsh education have been under one Ministry there has been a growing movement towards Welsh autonomy in education. In 1889 Parliament passed the Welsh Intermediate Education Act which provided for separate local committees to make provision for secondary education in Wales. In 1896 the Welsh Central Board was established—a representative body with the duty of inspecting and examining the intermediate schools. In 1907 there was constituted a separate Welsh department within the Board of Education, with a permanent secretary and a separate inspectorate for Wales. But the great educational Acts of 1902 and 1918, together with minor educational measures, have in the main applied alike to England and Wales. Thus in Wales the system of elementary education broadly corresponds to that in England. In 1920 the number of elementary schools was 1,901, of which 1,270 were council schools and 631 voluntary schools. Education is compulsory up to 14 years of age, and in 1919 the average attendance out of a total of approximately 464,000 scholars on the register was 380,000.

The position as regards secondary education deserves more particular notice. There are three groups of secondary schools in Wales which are on the grant-earning list or are recognized by the Board of Education as efficient. The first and largest group is that of the intermediate schools numbering 101 in 1020. They are examined and inspected by the Welsh Central Board, but they are also reported upon and certified by the Board of Education in respect of qualification for the Treasury Grant. Secondly, under the Act of 1002 the local education authorities have established, particularly in the large centres of population, 12 secondary schools, which are not under the Welsh Central Board but are examined and inspected by the Board of Education. Thirdly, there are a few endowed schools, six of which in 1920 were on the grant-earning list and five were recognized by the Board of Education as "efficient." The total number of schools, intermediate and secondary, eligible for grants in Wales in 1919–20, was thus 119, and the number of pupils 25,754, while in the five efficient schools, not on the grant-earning list, there were 788 pupils—the total number of pupils in secondary schools recognized by the Board of Education being 26,542. Thus the situation with regard to secondary education has been complicated in Wales and has suffered from dualism of control. The constitutional powers of the Welsh Central Board have not been such as enabled it easily to make provision for the increasing demand for secondary education and recourse has been necessary to the municipal and county authorities established under the 1902 Education Act. Accordingly in 1919 a committee was appointed by the Board of Education "to inquire into the organization of secondary education in Wales and to advise how it can be consolidated and coördinated with other branches of education with a view to the establishment of a national system of public education in Wales—regard being had to the provisions of the Education Act of 1918 and to the recommendations of the Royal Commission on University Education in Wales." In their report this committee, while recognizing the valuable work

achieved by the Welsh Central Board, drew attention to the fact that the system of secondary education as it has developed in Wales has, owing to the division of authority, provided an organization which "is less elastic and less adaptable than that of England to the new demands likely to be made upon it by the Act of 1918." They therefore recommend that the Welsh Intermediate Act, which being a "temporary" act has been periodically renewed, should be allowed to lapse, and that the intermediate schools and the municipal secondary schools should be brought under one local county education authority which should make provision for a completely coördinated scheme of secondary education within its area, and that a National Council of Education for Wales, representative chiefly of the Welsh universities and of the education authorities in Wales, should be set up under the Ministry of Education to which wide powers should be devolved in relation to the whole field of education, elementary, secondary and university. The aim is thus to provide in Wales a national educational authority more complete in its scope, and more representative in its constitution, than exists at present in any part of the United Kingdom. Meanwhile, as in England and in Scotland, there has been in Wales, especially since the war, a marked increase in the demand for higher education. The proportion of scholars who pass from the elementary to the secondary schools has, in nine years, risen from 35% to 53%. The further problem of the relation between the secondary schools and the university of Wales has received particular attention from the Royal Commission on University Education in Wales, and a scheme has been recommended whereby the county authorities shall assume greater responsibilities towards and receive increased representation in the National University, so that elementary, secondary and university education may be three closely related parts of one common system. The object in view is that no child on the ground of lack of means may be debarred from receiving the very highest education the nation can supply. Wales is thus in a most interesting and progressive stage of development towards a complete national scheme of democratic education. The growth of Welsh education is reflected in the great increase in the estimates of educational expenditure. In the year 1921–2 the estimates of net expenditure on elementary education in Wales amount to £4,999,804, while the estimates for higher education are stated at £846,716. Thus in Wales, elementary and secondary including continuation education already claim £5,845,000. So also in England the latest corresponding estimates (1921–2) provide for a net expenditure of £58,648,916 on elementary education and of £12,622,015 on higher education—the total figures for elementary education thus exceeding 71 millions. When it is remembered that considerably increased sums will be required for continuation education, and for further extension of university education, it will be seen how great and growing is the recognition of the service of education in England and Wales.

Education in Scotland.—The progress of education in Scotland in the period 1910–20 is in many respects similar to that which has been seen in England and in Wales. There was no Act for Scotland corresponding to the English Act of 1902, because conditions were different and at that time, as now, the local education authorities in Scotland were considerably in advance of those in England particularly as regards aiding, maintaining, and controlling secondary education. Scotland also did not follow the example of England by transferring the control of education from the school boards to her county and municipal councils. But at the close of 1908 the Education (Scotland) Act was passed, which can properly be regarded as marking an important stage in the development of Scottish education. For while it made no fundamental change in the educational system of Scotland the Act enlarged the powers and duties of local education authorities, and laid the foundations for the even greater Act of 1918.

In the history of education in Scotland, more than in any other part of the United Kingdom, there may be seen a steady direction of the national system along clearly marked lines, and the Act of 1908 and, later, that of 1918 illustrate this character. First, the idea of separate *ad hoc* local educational authorities has been maintained and Scottish education thus continues to present an interesting comparison with the system in England established since 1902. But while the school board system was maintained in Scotland until 1918 the need of larger areas has steadily made itself felt, and in the Act of 1908 powers were given to school boards to combine for various purposes. This immediately took effect and in the report of the Scottish Education Department for the year 1910–1 it is stated that 13 unions of school boards have already been effected by voluntary arrangement, or by order of the Department. It was pointed out, however, in the same report that it was doubtful whether this policy of combination of school board areas could be carried very far, and that, however active individual school boards might be within their own areas, it was clear that there are educational functions which transcend the sphere of the ordinary school board. This is particularly the case in respect of secondary education, where for effective work authorities controlling wider areas are necessary. The Act of 1918 carries out the work of enlarging areas and consolidating local organization, which had been thus tentatively advanced by the earlier Act of 1908. Secondly, as in England and Wales, there has been a continuous movement of transferring voluntary schools to the control of the statutory local education authorities. Such schools have not been so many or so important in Scotland as in England, but there has been a growing appreciation of the value of a national system which leaves room for variety of type and which recognizes the place of the denominational school within the national system. The Act of 1908 assisted the transfer of voluntary schools to the school boards, and the completion of this movement has been secured under the Act of 1918. Thirdly, there has been a steadily widening conception of the educational duties of local authorities. The Act of 1908 enabled school boards to make provision, either by themselves or in combination with other school boards, for the supply of meals to pupils attending school within their district, to provide conveyance and travelling expenses in order to help children in outlying districts to attend school, to extend information as to employment open to children on leaving school, and to make provision for the maintenance and education of physically or mentally defective children. It gave powers also to school boards to secure medical inspection and supervision of children attending school. A special Act of 1913 added medical treatment to medical inspection, and the Act of 1918 made such duties obligatory on the local education authorities. Fourthly, there has been a consistent policy of building up a complete national system, not only of primary and secondary education but of continuation education, and of increased facilities of university or other specialized higher training. The Act of 1908 made important provision for the extension of the system of continuation schools above the age of 14 years, requiring school boards to make suitable provision for such schools, and it thus prepared the way for a universal system of continuation education.

In two other respects also the Act of 1908 made a notable contribution to the better organization of Scottish education. It made provision for a national system of pensions and superannuation of teachers, and it consolidated and simplified the financial arrangements for the control and distribution of State grants by the constitution of the Education (Scotland) Fund.

The Education (Scotland) Act, 1918, which in many respects corresponds to the Education Act for England and Wales of the same year, may be regarded as the most important measure relating to education in Scotland since 1870. In one sense the Act only carries out developments which had been making themselves evident even before and especially after 1908. But the new stage marks the transition from tentative and partial efforts to that in which a wider envisagement of the whole field of national education is realized. A new order of local education authorities is called into being, in order to carry forward the work of developing the larger policy. In place of the 945 school boards and 38 secondary education committees, 38 local education authorities have been established, elected under the system of proportional representation, known as the transferable vote. To these local and county education authorities are

committed the powers of determining and controlling the whole system of primary, secondary and continuation education within their respective areas. To aid them in their work a system of school district management committees has been provided, each county being left to determine the number of such committees within its area. At the same time a representative National Council for Education has been constituted under the Act with the view of advising the Scottish Department of Education—an important step in bringing the central administrative organization into more direct touch with a representative body. Locally, also, provision has been made for the establishment of advisory councils, which may stimulate on the one hand public opinion and on the other assist the local education authorities on special questions, particularly such as relate to economic and industrial conditions. The value of such local councils has yet to be proved, but the step taken is significant of the desire to bring the administrative system both centrally and locally as closely as possible into touch with public opinion. In considering the great change which the Act of 1918 has made in the representative machinery of Scottish education, it may be well to point out that the working of the new machinery of government will demand close attention. It is permissible to doubt whether the Act has not gone too far in abolishing the local school boards and in constituting in their place county authorities with school management committees, which latter bodies frequently are concerned with an area larger than that of the former school board. The school management committees are selected in a variety of ways, but they do not have behind them the simple strength and influence of popular election. The measure of the success or failure of this step will be found in the extent to which local interest in educational matters is sustained or weakened. That statutory bodies, exercising wide powers and controlling larger areas, were necessary does not admit of doubt, but the sweeping away of the local school boards may be found to have removed the most effective agency of stimulating local interest in education. The problem of securing the best form of representative machinery to deal with modern educational problems is a matter of very great importance, and its solution is yet by no means reached. For that reason the variety of experience presented in the United Kingdom is of peculiar interest. It may be added that, at the election for the new local education authorities in Scotland under the Act of 1918, only some 30% of the electorate recorded their votes. This in itself is a significant and disappointing fact, and indicates the need, even in Scotland, of stimulating local interest in education. Another important constitutional aspect of the Act of 1918 was the change made in respect of financial administration. The Education (Scotland) Fund, as established under the Act of 1908, is by the Act of 1918 so regulated that the distribution of grants will give to the local education authorities greater discretion and flexibility in the expenditure of the moneys entrusted to them by Parliament. Instead of earmarking particular grants for particular services, the earning powers and claims of the local education authority as a whole are assessed by the Department of Education, and great latitude is allowed to the authorities in the disbursements of the sums, provision, however, being required for the maintenance of secondary education. There has resulted thereby a simplification of finance and an increase in the responsibilities of local education authorities. Apart from these important changes in the representative system and in financial administration the chief features of the Act are the raising of the full-time school age to 15 years and the requirement of obligatory continuation education up to 18 years of age. For the period of three years from the passing of this Act, the compulsory age for continuation education is limited to 16 years, whereas in England seven years elapse before the full policy of the Act can take place. The 1918 Act carried out to its logical conclusion a development which had been steadily advancing for many years throughout Scotland. Under the Act of 1908 it was lawful for school boards with the consent of the Scottish Department to make a by-law, requiring attendance up to the age of 16 at continuation classes. Already in the session of 1913–14, before the war interrupted normal development, 18 school boards in Scotland had availed themselves of this power, and in the Education Report for the year it is observed "that the need is apparent, after a lapse of five years since the Act of 1908 came into force, for more vigorous steps to be taken to interest and make more effective the provision of continuation-class instruction particularly in the rural districts," and it is pointed out that compulsory methods have stood the test well in the few districts where by-laws have been made.

The educational ladder in Scotland is now strongly established. There is an excellent system of primary education for children to the age of 14, and powers have been taken to raise the compulsory age to 15, while for those who have the ability to profit, and the desire to do so, there is a generous system of bursaries and maintenance grants from the elementary to the higher grade and secondary schools. It is claimed that any child of ability can now obtain higher education and in turn secure the further opportunity of a college and university education. In 1920 there were 3,019 primary schools in Scotland, with effective accommodation for 947,125 scholars, 104 intermediate schools or departments with accommodation for 16,420 scholars, 148 secondary schools or departments and 134 preparatory departments of secondary schools with total accommodation (including that of the preparatory departments) for 108,085 scholars, and 51 special schools for blind, deaf, mute or defective and epileptic children, having accommodation for 6,658 scholars. The total number of scholars in the register at the end of the school year 1919–20 was in primary schools (or departments) 760,343, intermediate schools (or departments) 11,909, preparatory departments of secondary schools 49,159, secondary schools or departments 44,095, special schools and classes 7,266—making a total of 872,772 scholars on a total estimated population of just over five millions. If the table of ages of scholars is examined it appears that rather more than a total of 20,000 pupils of 15 years of age or over were enrolled in the session 1919–20 in these various classes of schools. The proportion of secondary scholars to population is higher than in any other part of the United Kingdom, but it indicates how limited still is the number who, even in Scotland, receive full-time education beyond the age of fifteen. But there has been a steady increase in the total number of pupils attending intermediate or secondary departments. Even in the period of 1913–4 to 1918–9 the number of pupils enrolled in these schools rose from 47,742 to 58,948, and in the year 1919–20 the rate of increase has been fully maintained. As regards continuation classes the number of these in the session 1919–20 was 1,083, with 166,461 students. A feature, particularly of the last sessions, has been the development in Scotland as in England of classes organized by the Workers' Educational Association for adult pupils. As regards financial provision, the income of the education authorities under the Scottish Education Department was for the year ending May 15 1920 £9,629,-430, in this total the chief items of interest being grants from the Scottish Education Department £5,400,078, local education rates £3,973,531, school fees £119,046. Great as have been these advances in the sphere of education there remains one matter which is always of the highest concern, namely, the training and provision of teachers. Powers may be extended and equipment improved, but the most vital problem is the supply of teachers and of the spirit in which they carry out their work. In the past in Scotland the teachers' training colleges owed their foundation to provision made by the churches. The training colleges have gradually shed their denominational character, and in 1905 they passed under national and undenominational control. There has been a steady requirement of a higher standard of training and, to-day, practically all teachers in Scottish schools under the Department of Education are certificated. In 1920 the number of fully qualified teachers in State-aided day schools was 24,782—the proportion of teachers to pupils being in primary and intermediate schools 1 to 37, in secondary schools 1 to 23, and in schools and classes for blind, deaf, mute, defective and epileptic children 1 to 17. A particularly satisfactory feature is that, despite the losses and difficulties of recent years, the proportion of teachers to pupils is considerably higher in 1920 than it was in

1913–4. The Scottish educational system is thus, to-day, strong and progressive and it maintains its distinctive independence. But it is a striking evidence of the way in which autonomy tends to follow similar lines of development, that at no time has there been so much in common between English, Welsh and Scottish education as at the present day. Left free, each system develops its own peculiar spirit and traditions, but it also tends to assimilate itself to the standard of other progressive systems.

Education in Ireland.—The system of education in Ireland has undergone no such marked development as was seen in England and in Scotland during the years 1910–20. Educational progress in one part of the United Kingdom must always affect the other parts to some extent, and steps have been taken in Ireland as in other parts of the United Kingdom to make better provision for medical inspection, for the care of physically and mentally defective children, and for attending to the feeding of school children. But the condition of affairs has remained far from satisfactory in both primary and secondary education, and this is even more the case as regards continuation education.

In Ireland the control of education is divided between three public departments. The Commissioners of National Education deal with primary education, the Intermediate Board with secondary education, and the Department of Agriculture and Technical Instruction, with agricultural and technical education. To a limited extent coördination is secured between the several departments, and the Consultative Committee of Education, on which all three departments are represented, is an evidence of this. But the autonomy of the several departments remains the outstanding fact. Education undoubtedly suffers from this division of control, and from time to time the question has been considered of uniting the various boards of educational administration in one system. In Nov. 1919 a comprehensive Education (Ireland) Bill was introduced by the Chief Secretary for Ireland, which among other things proposed to set up a single Department of Education in Ireland, but it failed to become law. In the past the educational problem has been constantly overshadowed by political considerations and no effective step has yet been made towards that unity of direction and completeness of supervision which can only be secured either by a single department or by the closest coöperation and harmony between the separate departments. The difficulties and disabilities arising out of division are further accentuated by the widely different systems represented by the three boards. The Commissioners of National Education who are responsible for the position of primary education in Ireland, and who, therefore, have by far the greatest task placed upon them, represent a centralized and bureaucratic system of administration such as cannot be paralleled in any other part of the United Kingdom. As primary and secondary education are not matters which have been handed over, as in England and Wales, to the local county and municipal authorities or to local education *ad hoc* authorities as in Scotland, the only local control rests with the school management of the individual school and the local attendance committees. It follows, so far as primary and intermediate or secondary education are concerned, that there are no local rates. The financial resources required for this most important part of national education have, therefore, to depend upon moneys voted by Parliament, or upon the yield of endowments, contributions, and school fees. The result of this is that, so far as primary and intermediate education in Ireland are concerned, the financial position is most unsatisfactory. The resources for the maintenance, and still more for the improvement, of national education are very inadequate, and the old order has continued to exist at a time when great measures of educational advancement are being carried out in the other parts of the United Kingdom. The day has passed when grants from a central department, supplemented by voluntary contributions, can be equal to the burden of a national system of education, and Ireland is constantly suffering from the fact that she has not faced the responsibility of establishing a system of local education authorities, and of charging the local rates with a share of the burden of primary and intermediate education. The problem in Ireland is complicated by the denominational character of the schools and by the strong element of clerical control in local educational matters. But, if education is to advance, local and lay control must share the burden of responsibility, and developments in England, Wales and Scotland prove that alike the central Department of Administration and the local authorities can find a place in the national system for denominational schools. Until the people of Ireland locally and directly show their zeal for education by securing the establishment of local educational authorities with powers to rate, Irish elementary and secondary education cannot keep pace with the progress which is being made in the sister countries. The question is so fundamental that it must always be in view, as during the past ten years the difficulties inherent in the present system of primary and secondary education have been making themselves increasingly felt. In 1913 a Viceregal Committee of Inquiry into Primary Education was appointed to report upon the system of inspection of primary schools, the relations between teachers and inspectors, and the system of promotion of teachers in national schools, and both the evidence and the report illustrate how difficult is the problem of encouraging and remunerating teachers, and of giving scope for educational development where there are no local representative authorities and where promotion depends upon the report of inspectors and the decision of the National Board. Alike in Scotland, England, and Wales experience has proved how necessary it is to have wide areas and to link education closely with the interests of the community. In Irish primary education, the absence of local representative authorities controlling large areas with a wide range of schools accounts for much of the present stagnation of education, and places upon the Central National Board the increasingly invidious task of a bureaucratic system. Nor can it be said that there is any effective parliamentary control over Irish primary education. The system is thus constitutionally weak and fails to stimulate alike local interest and national public opinion in the vital question of education.

What is true of primary education in Ireland is also true in respect of intermediate education, though owing to the much more limited number of schools the problem is less acute. One of the most serious aspects, however, of Irish education remains the very inadequate provision which is made for secondary education, other than agricultural and technical education. The supply of schools, and the financial provisions for such as exist, fall far short of what modern Ireland should have. In Ireland, as in Great Britain, there is an increasing demand for higher education and with the change in the value of money the situation of the secondary schools is especially precarious. In their report for the year 1920 the Intermediate Education Board commented severely on the fact that the grants in aid of Irish secondary education from the Treasury are considerably less than the proper share which should have been allocated for this purpose when compared with the grants in England, Wales, and Scotland, and they conclude their report with the grave words ". . . remembering also the scanty funds with which our admittedly successful efforts were achieved, it is difficult for us at this juncture—when the whole edifice of secondary education in Ireland is toppling to destruction—to refer to these matters in language of moderation and restraint. Of one thing, however, we feel quite certain, and that is, that if something is not done immediately to place Irish secondary education in the position of financial equality with that of Great Britain, it is impossible to see how the complete disruption of the system can be avoided." In one respect improvement has been made in recent years in the work of the Intermediate Education Board, by the belated establishment of a system of local inspection. The Intermediate Board system has been in the past too much a central examining body rather than an educational department, and even with the limited step which has now been taken to secure supervision of the intermediate schools and their work by the board's inspectors, control is largely exercised through the medium of written examinations. Thus both in respect of primary and intermediate education, Ireland has presented a very unprogressive form of organization and even with the improvements made in recent years, the system remains very

far from satisfactory. There is no part of Irish public administration in which reconstruction is more vital or more urgent. According to the Commissioners of National Education in 1918–9, the average number of pupils on the rolls of the 8,802 primary schools in Ireland was 708,353, and the average attendance 488,031—or 68·9%. The highest average yearly attendance in the past ten years has been 72·6 per cent. These figures are in themselves eloquent as to the very backward state of Irish primary education. The State expenditure on Irish primary education amounted in 1918–9 to £2,375,362. In respect of secondary education, 386 schools in Ireland received grants under the Intermediate Education Board in 1920, the total number of pupils between 12 and 19 years of age in these schools being 27,250. The number of pupils between the ages of 14 and 19 years, who presented themselves for examination under the Intermediate Board, was 11,948, of whom 6,002 passed. The grants to intermediate or secondary schools from the statutory funds and the parliamentary grants of the Intermediate Board amounted in 1920 to rather less than £142,000.

The third department responsible for a part of Irish education is the Department of Agriculture and Technical Instruction, and at least in this field of agricultural and technical instruction Ireland can claim to have a system which is worthy of comparison with that of any modern state. The importance of the system established in respect of agriculture and technical instruction lies not simply in the merit of the education provided in the schools and colleges under the Department's supervision, but in the improved representative relationships between central and local authorities provided by the constitution of the Department. The Agriculture and Technical Instruction Ireland Act of 1899 provided for the appointment of local statutory committees of the county councils and municipal councils of Ireland to deal with the subjects of agriculture and technical instruction, including the raising of local rates for these purposes. It also brought about the establishment of a central Council of Agriculture, consisting in respect of two-thirds of its membership of representatives of county councils, the remaining third being nominated by the Department. At the same time provision was made for the appointment of a Board of Agriculture chosen in respect of two-thirds of its membership from the Council of Agriculture, the remaining third being nominated by the Department, and of a Board of Technical Instruction representing chiefly municipal and borough authorities concerned in technical education. Important functions and powers were given to these bodies of shaping the policy and the administration of the Central Department. The result of this representative machinery has been a closer harmony between central and local authorities than has been secured in any other field of public administration in the United Kingdom, and the great progress which has been made in Ireland in the two decades of the 20th century, both in agricultural education and technical instruction is in no small measure due to the admirable constitutional organization which was laid by the founders of the Department. The close relationships between central and local authorities have, even in a difficult period of national affairs, led to increased interest in the progress both of agriculture and of technical instruction, and no part of government in Ireland has succeeded in so fully associating the people with the work of administration and in educating public opinion and eliciting local financial support. The work which thus centres round the Irish Department of Agriculture and Technical Instruction has exercised a great influence on modern Ireland. It has given a much needed impetus and direction to science teaching and research, to agricultural study and investigation, to manual training and craftsmanship, to commercial and industrial subjects in relation to the economic conditions of the country and to domestic economy and public health education—all of which are peculiarly vital to a community in which education has suffered from a too narrow and bare curriculum. But it has done more, and has suggested, by experience, the possibilities of a much wider reëstablishment of Irish education in which all parts will be brought into closer relation one with the other and strengthened by association with central and local representative committees. In the year 1918–9 the grants made out of the parliamentary vote to technical schools and classes of science and art amounted to £114,210—while a further expenditure on technical instruction, amounting to £65,867, was made out of endowment funds. In addition to these sums the sum contributed from local rates amounted to £36,518. The number of students attending technical schools and classes was 37,241, and the number of students recognized for grants in connexion with technical instruction in day secondary schools was 14,822.

Conclusion.—Looking back over the period from 1910–20 and across at the varied developments in the countries which make up the United Kingdom, the year 1918 stands out as summing up the effort of the preceding years and projecting the task which succeeding years have to fulfil. Nineteen-eighteen is the symbolic year, and the place which education then filled in the thought of the nation is itself a revealing fact. There has been a great widening of the horizon. The school now goes down to the nursery school, and the leaving age rises. The defective children are being treated, and the child life of the nation is its care. Slowly but surely a national system in the full sense is evolving in England and in Wales, no less than in Scotland. Ireland still has to solve her educational problems and must do so in her own way and by her own genius.

The great task is now the building up of higher education on lines which call out and use the talent and spirit of the nation. The problems are vastly more complex and difficult than those of primary education. But they are being solved, and increasingly generous financial provision for education is forthcoming. The education estimates already bid fair to rival the place which the naval and military estimates have taken, and before long it may prove true that in no field of public expenditure has the State to shoulder so large a responsibility as in education. But education is not only a means but an end. And a Nation like an individual has to work and save in order that it may enjoy the fullest education. One can discern the coming of this spirit in England, and it is a sign of hope for the future. Nothing but a united community and the combined strength and experience of central and of local authorities, of state and of voluntary organizations, can provide a solution to the problems which the higher education of youth and adult life has in store. Nor must it be forgotten that social institutions are a great factor in national education. The Boy Scouts, and Girl Guides, the Women's Institutes, the village clubs, the allotments movement, the coöperative societies, these and many other voluntary agencies are growingly powerful factors in national development and education. And judged by the progress of such movements, the second decade of the 20th century and the closing years of that decade will stand out in the annals of English education. (W. G. S. A.)

(2) United States

Each state in the American Union has its own system of education, which includes elementary and secondary schools, and, in all except the states of the extreme north-east, state institutions of higher learning. All of the 48 states have enacted compulsory school laws, but in their standards, and in the enforcement of them, they vary widely. School attendance is (1921) generally required of children between the ages of 8 and 14 or 16 during from 6 to 8 months in the year, and many states further require attendance upon part-time or evening classes by those who have not acquired a prescribed minimum of education or who can not adequately speak, read and write the English language. The National Government, through Congress in 1916, notably reënforced the compulsory school laws of the states by an enactment prohibiting the shipment, in interstate commerce, of any articles in the manufacture of which children under 14 have been employed. In place of the almost universal requirement of eight years in the elementary school and a nearly uniform curriculum, there is manifest a tendency to group together as a "junior high school" the seventh, eighth and ninth grades, which otherwise would constitute the last two years of the elementary school and the first year of the secondary school. The purpose of the rearrangement is to facilitate departmental teaching, to free the

child from the rigid grade system of promotion, by which a failure in one subject necessitates the repetition of the whole year's work, to permit earlier a choice of courses and thereby prepare the pupil for greater accomplishment in his chosen field during the later high-school years. The public secondary schools have grown by leaps and bounds in numbers and resources. Their enrolment doubled in the 10 years 1908–18 and between the years 1918 and 1920 there was a proportionate increase. They are no longer essentially stepping stones to college; they represent the continuation of the common schools, and their function is to complete the formal education of that vast majority which will never enter institutions of higher learning.

Colleges and Universities.—Throughout the country, but especially in the west and middle west, so called "junior colleges" are becoming numerous. The term is somewhat a misnomer. Some of these institutions are derived from small, non-tax-supported colleges which, finding themselves financially unable to continue satisfactorily the full four-year course, limit themselves to two years, and others, more significantly, from the upward extension of the vigorous public high schools. This type not only brings the opportunity for higher education within the reach of many who could not leave the immediate vicinity of their homes, but also reacts favourably on the pupils and teachers of the secondary schools from which it grew. The college remains the most characteristically American feature of educational development in the United States. In 1920 there were enrolled more than 250,000 college students. Entrance requirements have become less rigid, as indicated by the recommendation of the conservative Association of New England Colleges: that its members adopt "a system of tests for admission in which a certificate shall be taken for the quantity, and examination shall be held in a limited number of subjects for the quality, of school work." The curriculum covers a very wide range of subjects, but experience has shown that it is unwise to permit the student to exercise untrammelled freedom in the choice of his studies, and most colleges now limit the selection of courses in such manner as to prevent too great concentration and too great dispersion as well. The universities, though not more numerous, have in recent years grown stronger. Their graduate departments, better manned, attract more students. In this respect the development of the state-supported institutions has been remarkable. A few years ago only three had achieved distinction in this field; by 1921, 12 had qualified for membership in the Association of American Universities, and constituted one-half of its members. The enrolment of graduate students in all universities was in 1916 11,215; in 1920 it was upwards of 16,000. So great has become the demand among women for higher education that the colleges exclusively for women are no longer able to provide for the rapidly increasing number of applicants for admission. Bryn Mawr, Vassar, Wellesley, Smith and Mt. Holyoke have been forced to establish waiting lists. The doors of the universities for the most part stand open to women upon an equal footing with men. By 1920, 44% of the students, graduate and undergraduate, enrolled in the universities, colleges and technological schools, were women, and it may confidently be predicted that they will soon outnumber the men. The general admission of women to courses in medicine removes practically the last barrier discriminating between the sexes.

Professional Education.—Schools for professional training have grown rapidly. Whereas a century ago professional education comprised little more than preparation for the ministry, it now includes theology, medicine, law, the new profession of engineering, and two offshoots of medicine, dentistry and veterinary medicine. Pharmacy and nursing are sometimes regarded as professions because a specialized education is prescribed for those who would practise them.

Theology.—The colleges first founded in what is now the United States, Harvard, William and Mary, and Yale, were established to train men for the Christian ministry. As the colleges have developed into universities the original aim has been merged into the broader purpose of providing liberal education for all, while influential schools of theology have grown up, for the most part, as strictly denominational institutions independent of the universities. During recent years the content of the curriculum and methods of teaching have been revised. Formal theology is emphasized less, a first-hand knowledge of human relationships more; Hebrew is not always obligatory, while the results of literary and historical criticism are fully discussed. Freedom of thought in some institutions has completely liberalized the training and greatly modified the traditional theology. During the years 1870–95 the number of theological students increased more rapidly than the general population. During the next 25 years the figures show marked fluctuations, but for the period as a whole neither student enrolment nor the number of graduates kept pace with the increase in population.

Medicine.—The medical schools of the United States were slow to adjust themselves to the new conditions brought about by the growth of medical science. They followed the model of continental Europe rather than that of Great Britain, in that the teaching was almost exclusively by lectures but imposed no definite requirement as to preliminary education. There was lacking also, for the most part, stimulating contact with colleges or universities of high academic ideals; and therefore there developed an organization which lent itself readily to commercialism. In recent years, however, medical teaching has been revolutionized, and now exemplifies the highest standards of professional education. The rapid development of physiology, pathology, embryology, chemistry and hygiene has necessitated the enlargement of the curriculum to include these subjects. Laboratory methods of teaching have been introduced at very great cost for buildings and equipment. Teachers qualified by training and experience have superseded practising physicians as instructors in the fundamental sciences; in the clinical branches also pedagogical standards have been raised. Satisfactory preliminary education is regarded as essential, and all recognized medical schools (1921) require of candidates for admission the completion of the four-year secondary school course and at least two years of college work, including physics, chemistry and biology. Cornell, Western Reserve, and Leland Stanford require three years of college for entrance; Harvard a degree from, or two years of high rank in, a college or scientific school; Johns Hopkins a Bachelor's degree or its equivalent. Most significant of all, the student is again brought into intimate contact with the sick; hospitals and dispensaries are used as laboratories where the prospective physician may acquire skill in examining patients and familiarity with the manifestations of disease. The degree of Doctor of Medicine is conferred on completion of the medical course, which in nearly all schools is four years in length. A few institutions require also a fifth year, spent as an *interne* in a hospital, before granting the degree. Advancing educational requirements, the consequently greater cost of medical training, and the increasing knowledge and interest of the public in matters of public health have combined to reduce the number of medical schools from its maximum of 162 in 1906 to 85 in 1920; of medical students from 28,142 in 1904 to 14,088 in 1920; and of medical graduates from 5,747 in 1904 to 3,047 in 1920.

Law.—Legal education in the United States began in a kind of apprenticeship, an intimate personal relationship with a practising lawyer. The increasing complexity of legal machinery and the resulting specialization on the part of legal practitioners rendered it impossible for a student to gain a complete education in a single office. Schools were therefore established offering systematic courses of lectures, and attendance on such schools, in addition to a clerkship in a law office, is now required for admission to the bar. The length of the law course has been increased from one to two and from two to three years and the curriculum correspondingly enriched. In some instances the student is permitted a choice of electives. Most schools have adopted the "case method" of teaching, which consists in presenting to the student the records of selected cases. These records he analyzes, and from them deduces the legal principles involved. Lectures and moot courts are also employed. The minimum of preliminary training required for admission to a recognized law school is the completion of the four-year secondary

school courses, but many of the universities demand in addition two years or more of college work. In 1921 the number of law students was more than 27,000, an increase of nearly 20% over the pre-war figures.

Engineering.—The beginnings of American technological training were made, not in the long-established colleges, but in a group of special schools, independently founded, such as the Massachusetts Institute of Technology in Boston and Stevens Institute in Hoboken, N.J. Later the universities took up engineering education with avidity, built up elaborate departments and offered the greatest variety of courses. Another type of technical school is the state college of "Agriculture and Mechanic Arts" supported by land grants from the Federal Government. Engineering schools require of applicants for admission the completion of the four-year secondary school course. Instruction is largely by means of laboratory courses. The university of Cincinnati has gone a step further and perfected an arrangement by which students spend half their time outside the college, actually employed in some form of engineering work; periods of two weeks of study alternate with like periods of practice in a shop. The degree of Bachelor of Science, with or without specification of the branch studied, is commonly conferred after four years of college work. Those of Civil Engineer, Mining Engineer, and so forth, are awarded for undergraduate work by some schools in place of the B.Sc.; by others reserved for more advanced study.

Dentistry.—Since 1900 there has been increasing uniformity among dental schools until in 1921 all recognized schools required for admission at least the completion of a four-year secondary school course, and gave four full years of professional training. It was even proposed that beginning in 1926 the entrance requirement for dental schools be raised to include two years of college work. The growing appreciation of the value of dentistry is indicated by the increase in the ratio of the number of dentists to the total population. In 1850 this ratio was 12 for 100,000; in 1910 it was 43; in 1920, 56.

Veterinary Medicine.—In this, as in other professions, there has come a realization of the necessity for a solid foundation of general education on which to base special training. The accepted standard in 1921 was the completion of a four-year secondary school course and three years in a college of veterinary medicine. In 1900 13 schools enrolled 362 students and graduated 100 veterinarians. In 1916 the numbers had increased to 22 schools, 3,064 students and 759 graduates. The war brought about a great reduction in the number of those choosing veterinary medicine as a career. In 1921 the number of veterinary schools declined to 14 and the student enrolment to 849.

University Extension.—Under this head are grouped all those activities of institutions of higher learning which are carried on for the benefit of people unable, through lack of time or training, to matriculate in the regular college or university courses, but who still desire some form of higher education, and this extension of facilities is designed to include in its scope persons many years older than the ordinary undergraduate. Originally no more than a series of public lectures on topics of literary, historical or scientific interest, this extra-mural teaching has extended its range, diversified its method, and multiplied its activities, until it has become, in some instances at least, an important function of the university. The spirit of service to the community which it embodies was expressed by the late President Van Hise in these words:—"So far as the university of Wisconsin is concerned, we propose to take up any line of educational work within the state for which the university is the best fitted instrument." and again, "It is my ideal of a state university that it should be a beneficent influence to every citizen of the state." In such a programme the whole realm of human knowledge is included, from sewing to Sanskrit and from plumbing to philosophy. Summer sessions, of from six to eight weeks' duration, provide valuable opportunities for those, chiefly teachers and students, whose work allows a long vacation. Varying standards prevail in the summer schools; in not a few the amount and quality of the work render it acceptable as part of the requirement for a degree. The university of Chicago has made its summer session the full equivalent of one of the winter terms and operates on a four-quarter schedule. Teaching by mail is another method employed by some universities to widen their spheres of influence. Extension teaching is also carried on by local boards of education, especially in large cities. Much of it takes the form of part-time classes for children who have left school prematurely and for immigrants who lack command of the English language. Private enterprise outside of academic circles has contributed to extension teaching along two distinct lines. The Chautauqua Assembly is the prototype of the summer school, and has exerted a very wide influence through the thousands who each year attend its courses. Quite different in scope, but not less valuable, is the kind of work done by other institutions which provide opportunities and incentives for continuous and serious study as well as lecture courses and concerts having a wider appeal. Perhaps the most valuable extension teaching is that which reaches into the home, bringing to the mother such information as will aid her in solving her manifold and peculiar problems. The U.S. Government prepares and distributes upon request a comprehensive series of pamphlets containing instruction regarding the selection and preparation of food, infant feeding, child hygiene and many other subjects. Whenever possible, nurses and women trained in the household arts visit the homes and, by personal directions and demonstration, often succeed in promoting the welfare of the family where print alone would fail. Intellectual development is stimulated by courses of home reading. The recognition of the importance of home influences as factors in the child's success at school has led to the formation of "parent-teacher associations," from which the teachers gain a knowledge of the home environment of their pupils and the parents learn how best to coöperate in the education of their children.

Vocational Training.—This term denotes training of less than college grade, designed to fit the individual to earn a livelihood. Its beginning in the form of manual training may be traced back as far as 1880, but except for a few isolated experiments it is a development of the 20th century. Phases in the progress toward an understanding of the problem have been:—(1) attention was focussed on "misfits"; based on what might be called a "niche" theory of society, the problem was stated as that of finding the particular place or station in life that exists somewhere for each individual; (2) it was held to be the duty of society to regard with earnest concern and in some way to aid those that are defective; (3) then came the idea that the schools might prevent individual and perhaps unusual types from being spoiled in the making; (4) next came a shift in emphasis to the necessity for vocational training; and (5) finally has come a recognition of the necessity for an educational survey of the community in order to determine what opportunities are already available and what its industrial needs really are. The so-called Smith-Hughes Act passed by Congress in 1917 authorized appropriations which will aggregate $7,000,000 a year for promoting, in coöperation with the states, special training in schools designed to meet the needs of those who are preparing to enter agriculture or industry; provision is also made for training teachers for this work by industrial or commercial corporations and by the coöperative effort of the schools and the corporations. The teaching of domestic science was begun in the schools of Framingham, Mass., in 1898. The desirability of such training for every young girl has led to the inclusion of one or more courses in home economics in the curriculum of every girls' high school and also in the upper grades of the better-organized elementary schools.

Agricultural Education.—Training for agricultural pursuits, more than any other branch of education, has been fostered by the Federal Government. Its development manifests several stages, each characterized by a different method. The land grants of 1862 led to the establishment of state colleges of "Agriculture and Mechanic Arts," which, however, for a generation at least, were predominantly schools of engineering. In 1887 Congress authorized subsidies to agricultural experiment stations under state control, a policy the wisdom of which was quickly demonstrated. In a few years these stations accumulated a wealth of exact knowledge relating to farm problems which

would have been of inestimable value if it could have been applied. Then came the development of agricultural extension education employing agencies such as lectures, bulletins, correspondence courses, reading courses, farmers' institutes, short courses at agricultural schools, travelling libraries, educational trains, demonstration farms, educational exhibits at fairs and moving pictures. This phase culminated in the Smith-Lever Act of 1914, which appropriated more than $4,000,000 annually to he apportioned among the states for agricultural extension work. Such activity, creating a great demand for teachers and farm demonstrators, reacted beneficially upon the agricultural colleges. Meanwhile another tendency was becoming manifest. The science of farming was heing taught in the secondary schools. This plan possessed so many obvious advantages and showed such satisfactory results, that during the decade following 1910 it was widely adopted. In 1920 1,797 public secondary schools, with an enrolment of 27,755 pupils, provided vocational instruction in agriculture. In most schools the boy or girl is required to carry out, under supervision, some definite enterprise such as the cultivation of a small plot, the raising of pigs or poultry or the conduct of a miniature dairy. A detailed record of the undertaking, including a financial statement, is required and affords a basis for grading pupils' work.

Certain private corporations, not directly engaged in teaching, have influenced education in the United States. The General Education Board, incorporated by Congress in 1903, has employed the funds at its disposal in assisting institutions of higher learning throughout the country, and in the southern states it has also promoted the development of the secondary schools and the teaching of agriculture. Recently it has entered the field of medical education. The Carnegie Foundation for the Advancement of Teaching, incorporated in 1906, starting with a programme of pensions for retiring college professors, has been led into the field of investigations and surveys. The published reports of its findings have contributed in large measure to educational progress. The Russell Sage Foundation performs similar service.

Statistics.—The magnitude of educational work may be indicated by figures from the report of the Commissioner of Education for the year 1918. The total enrolment of pupils amounted to 23,433,726, and the estimated total cost $1,059,934,803, making the average outlay $45 per pupil enrolled and $10 the cost *per capita* of the whole population. Teachers and supervisory officers numbered 769,763, of whom 23% were men. The bureau reported 670 colleges, universities and professional schools, with an enrolment of 355,131. For the public schools of elementary and secondary grade the following figures were given:—

Number of pupils	20,853,516
Average number of days schools open	160·7
Average days' attendance by each pupil	119·8
Number of male teachers	105,194
Number of female teachers	545,515
Number of school-houses	276,827
Average annual salary of teachers	$635
Value of all school property	$1,983,508,818
Income from permanent funds and rents	$21,517,040
Income from local taxes	$580,619,460
Income from state taxes	$101,305,057
Income from other sources	$33,434,885
Expenditure for sites, building and equipment	$119,082,944
Expenditure for salaries	$436,477,090
Expenditure for other purposes	$208,118,055
Expenditure *per capita* of whole population	$7.26
Expenditure per pupil in attendance	$49.12
Expenditure per pupil per day	$.307

(A. S. D.; N. M. B.)

EDWARD (Edward Albert Christian George Andrew Patrick David), Prince of Wales (1894–), eldest son of King George V. and Queen Mary, was born June 23 1894, at White Lodge, Richmond Park, and baptized twenty-five days later by the Archbishop of Canterbury. In 1902, Mr. H. P. Hansell was appointed his tutor, and remained with him from that time until Aug. 1914. During 1902–7 the Prince was prepared for the navy, and in the spring of 1907 he entered Osborne, where he remained for two years before going on to the Royal Naval College at Dartmouth. During his time at Osborne, Capts. E. Alexander-Sinclair and A. H. Christian were in command, and Capts. T. D. L. Napier and H. Evan-Thomas at Dartmouth. On June 24 1910 he was confirmed in the private chapel at Windsor Castle. While still a cadet at Dartmouth he performed his first public duty on March 29 1911, by presenting to the mayor and corporation of that town the silver oar which they held formerly as a symbol of the rights associated with the Bailiwick of the Water of Dartmouth. At the close of his Dartmouth training in June 1911 he was invested as a Knight of the Garter, and on July 13 1911 he was created Prince of Wales and Earl of Chester. He was shortly afterwards invested as Prince of Wales in Carnarvon Castle, of which Lloyd George was at that time constable, and on this occasion for the first time an English prince addressed the Welsh people in their own tongue. Shortly after this event the Prince became a midshipman, and was appointed to H.M.S. "Hindustan," in which ship he served for three months under Capt. Henry Campbell. The months which followed this cruise were spent quietly at Sandringham in preparing for Oxford, but during the spring of 1912 the Prince spent five months in Paris as the guest of the Marquis de Breteuil, during which period he was ably coached by M. Maurice Escoffier in the language and history of the country. In Oct. 1912 the Prince, accompanied by Mr. Hansell and Maj. the Hon. William Cadogan (10th Hussars), who had recently been appointed his equerry, became a freshman at Magdalen College, Oxford. During his time at Oxford the Prince entered heartily into the corporate life of his college and the usual athletic amusements of the undergraduates. The Prince resided in college rooms, dined in hall or at one of the university clubs, and mixed freely with his fellow undergraduates. Some of his vacations he spent in European travel, visiting Germany twice, in 1912 and 1913, and Denmark and Norway in 1914. The Prince's university career was ended by the outbreak of the World War in Aug. 1914 on the eve of his third year. On Aug. 7 he was gazetted 2nd lieutenant in the Grenadier Guards, and on the 11th he joined the 1st battalion at Warley Barracks, Essex.

In Nov. 1914 the Prince, who had been appointed aide-de-camp to Sir John French, arrived in France and took up his new duties at British G.H.Q. at St. Omer. During the next 18 months he served with the Expeditionary Force in Flanders and in France in various parts of the line, being first attached to the 2nd division under Maj.-Gen. Horne, to the I. Corps under the command of Lt.-Gen. Sir Charles Monro, and later to the Guards division under Maj.-Gen. the Earl of Cavan. In March 1916 he was appointed to the staff of the G.O.C. the Mediterranean Expeditionary Force, and proceeded at once to Egypt. He took the opportunity of seeing the troops in various parts of the line on this front, and also went as far south as Khartum. On his return journey he paid a visit to the Italian headquarters at Udine, and by the middle of June had returned to the British armies in France. He was then attached to the XIV. Corps (Lord Cavan) in Flanders and France, taking part in the battles of the Somme and Passchendaele, and subsequently proceeded with this corps, in Oct. 1917, to the Italian front, where he remained till Aug. 1918. In May 1918 the Prince paid a semi-official visit to Rome. The Prince then returned to France and was attached to the Canadian Corps, with whom he was serving at the time of the Armistice. He was attached to the Australian Corps in Belgium till the beginning of 1919, after which he visited the Army of Occupation on the Rhine, spending a few days with the New Zealand division, and paying a short visit to General Pershing at the American headquarters at Coblenz.

On his return to England at the end of Feb. 1919 the Prince almost immediately took up a number of public duties which had of necessity been deferred during the war, and on May 29 was admitted to the freedom of the City of London. On Aug. 5 1919 he left Portsmouth in H.M.S. "Renown" for Newfoundland and Canada, first setting foot on Canadian soil on Aug. 15 at St. John, New Brunswick. His tour extended through the entire Dominion from E. to W., and five days after reaching Victoria on Sept. 23 the return journey began by a slightly

different route. The Canadian tour ended at Ottawa, and on Nov. 10 the Prince left for Washington to pay a short official visit to the President of the United States. New York was subsequently visited, and after a long series of official engagements, the Prince sailed for Halifax, where he bade good-bye to Canada, and reached Portsmouth on Dec. 1.

After a short stay in England the Prince sailed again in H.M.S. "Renown," on March 16 1920, for New Zealand and Australia. The first port of call was Barbados, and then, passing through the Panama Canal, short visits were paid to San Diego (Cal.), Honolulu and Fiji, Auckland being reached on April 24 after a voyage of 14,000 miles. A month was spent in New Zealand, visiting all parts of the North and South Is., and on May 26 the Prince landed at Melbourne. During his stay in Australia he visited all states of the Commonwealth, and eventually sailed from Sydney harbour on Aug. 19. On the return journey stops were made at Fiji, Samoa, Honolulu and Acapulco, and, after passing once again through the Panama Canal, three weeks were spent in the West Indies. The last port of call was Bermuda, and H.M.S. "Renown" eventually reached Portsmouth on Oct. 11 1920. The Prince received a magnificent reception on his arrival in London, and, as had been done on his return from Canada and the United States, the conclusion of his world-tour was celebrated by the King and Queen at a banquet at Buckingham Palace, and the Prince was shortly afterwards entertained by the Lord Mayor at the Guildhall, where he gave an account of his travels.

After a brief holiday, spent for the greater part in the hunting-field, he resumed his public duties after Christmas, 1920. During the first six months of 1921 H.R.H. was occupied chiefly in London, but found time to visit, among other places, Oxford, Cambridge, Glasgow and the Clyde; his Duchy of Cornwall property in Devon, Cornwall and the Scilly Is.; Cardiff, Newport and Bristol. On June 23 1921 the Prince spent part of his 27th birthday with 1,000 East End children who were entertained by the Fresh Air Fund in Epping Forest. On Oct. 26 he sailed in the "Renown" on a State visit to India.

EDWARDES, GEORGE (1852–1915), English theatrical manager, was born in Ireland Oct. 8 1852. He was educated for the army but deviated into theatrical business and became manager successively to Michael Gunn at the Theatre Royal, Dublin, and to D'Oyley Carte at the Savoy theatre, London. In 1885 he joined John Hollingshead at the Gaiety theatre, London, and the next year took over the sole management of that theatre, which he ran with striking success up to the time of his death. He also built and managed Daly's theatre, was managing director of the Empire theatre and at different times acted as manager, or producer, at a number of other London theatres. Incidentally he was well known as an owner of racehorses. He died in London Oct. 9 1915, never having quite recovered from the effects of confinement in Germany, where he was interned on the outbreak of the war.

EDWARDS, ALFRED GEORGE (1848–), first Archbishop of Wales, was born at Llanymawddwy Nov. 2 1848, and was educated at Jesus College, Oxford. He was ordained curate of Llandingat, Carmarthen, in 1874, and became warden and headmaster of the college, Llandovery, in 1875, holding this position until 1885, when he accepted the living of Carmarthen. In 1889 he became bishop of St. Asaph. In 1920, after the disestablishment of the Welsh Church, of which measure he had been one of the most active opponents, he was created Archbishop of Wales, and was enthroned by the Archbishop of Canterbury at St. Asaph cathedral June 1.

Amongst his publications may be mentioned *The Church in Wales* (1888); *Common-Sense Patriotism* (1894); and *Landmarks in Welsh Church History* (1912).

EDWARDS, ENOCH (1852–1912), British Labour politician, was born at Talk-o'-the Hill, Staffs., April 10 1852. He was the son of a pitman, and worked as a boy in a coal-mine. In 1870 he became treasurer of the North Staffordshire Miners' Association and was elected secretary to the same body in 1877. In 1884 he went to Burslem, where he became a member of the school board and town council in 1886, and later he became alderman and mayor. In 1880 he became president of the Midland *Miners' Association*; he was later president of the Miners' Federation of Great Britain and a member of the Staffordshire county council. He was elected to Parliament in the Labour interest as member for Hanley in 1906. He died at Southport June 28 1912.

EDWARDS, JOHN PASSMORE (1824–1911), English newspaper proprietor and philanthropist, was born at Blackwater, Corn., in 1824, the son of a carpenter, and was mainly self-educated. In 1844 he became London representative in Manchester of the *Sentinel*, an anti-Corn Law weekly newspaper. A year later he went to London and began lecturing, together with the practice of journalism, starting several small periodicals which in succession failed, until in 1862 he bought the *Building News*, which by 1866 had made a handsome profit. In 1876 he bought the London halfpenny evening newspaper, the *Echo*, and controlled it for 20 years. He was an ardent peace advocate, and supported a number of humanitarian and philanthropic objects, endowing various libraries and other institutions which bore his name, notably the settlement in Tavistock Place, Bloomsbury, now called, in memory of Mrs. Humphry Ward, the Mary Ward Settlement. He also founded a Passmore Edwards scholarship at Oxford for the conjoint study of English and classical literature. He published privately an autobiography, *A Few Footprints* (2nd ed. 1906). He died in London April 22 1911.

See E. Harcourt Burrage, *J. Passmore Edwards* (1902).

EGGLESTON, GEORGE CARY (1839–1911), American journalist and author (*see* 9.17), died in New York April 14 1911.

EGYPT (*see* 9.21).—Turkish suzerainty over Egypt was formally abolished in Dec. 1914 when a British protectorate was proclaimed, while the acquisition of Tripoli and Cyrenaica by Italy and the establishment of Palestine as a separate state under a British mandate cut Egypt off from all territorial connexion with the Turkish Empire.[1]

Population.—At the census of March 1917, the inhabitants numbered 12,750,918, as contrasted with 11,287,359 in 1907, an increase of 12·9% (compared with an increase of 14·9% for 1897–1007). The number of foreigners in the country in 1917 was 238,661, a figure which owing to war conditions did not represent the normal foreign population. While the area of Egypt is some 350,000 sq. m., the cultivated and settled area—the Nile valley and delta—covers only 12,226 sq. m., and in this restricted area the inhabitants in 1917 exceeded 1,000 per sq. mile. The number of nomads and semi-nomads was estimated at 452,263. The pop. of the chief towns in 1917 was: Cairo, 790,939; Alexandria, 444,617; Port Said (including Ismailia), 91,090; Tanta, 74,195; Mansura, 49,238. Classified by religions there were in Egypt in 1917: Moslems, 11,658,148; Copts, 854,778; other Christians, 155,168; Jews, 59,581, and "others," 23,243. On July 1 1919 the pop. was calculated at 12,878,000.

General Economic Conditions.—By 1911 the State finances had recovered from the effect of the economic crisis of 1907—a crisis due to over-speculation and extravagance following a period of much prosperity. But at the opening of 1914 the liabilities left over from 1007 still weighed heavily on private finance. The outbreak of the World War in Aug. 1914, just when the cotton crop was about to be harvested, threatened once more to place

[1] The question as to how far Egyptian territory extended along the Mediterranean W. of the Nile was settled in 1911. The Italians upon declaring war on Turkey in that year proclaimed a blockade of the coast as far E. as Ras el Kanais, thus reviving the Turkish claim as to the limits of Cyrenaica. The British Government on behalf of Egypt protested, maintaining that, as both Turkey and Italy had been notified in 1904, Egyptian territory extended to the Gulf of Sollum, 150 m. W. of Ras el Kanais. In this contention Italy acquiesced and the frontier between Italian territory (Cyrenaica) and Egypt was fixed at the head of the Gulf of Sollum, the small port of that name being left to Egypt. The British Government further announced that inland they regarded the oasis of Jarabub as part of Egypt. In 1919, however, it was agreed to transfer Jarabub to the Italian sphere (*see* SENUSSI AND SENUSSITES).

Egypt in great economic difficulties. The price of cotton fell by a third and a panic was averted only by drastic measures taken by the Government. As part of these measures a general moratorium was proclaimed and an emergency currency obtained by making the notes of the National Bank of Egypt temporarily legal tender and inconvertible. But cotton, stimulated by war demands, had again risen to pre-war prices by the end of 1915, and this, together with forced economy and the large sums spent by the army stationed in the country, restored the situation. Taking the country as a whole a new period of prosperity set in, chiefly due to the soaring price of cotton—which in April 1920 was almost ten times its value in 1913. During the war exports greatly exceeded imports in value, and, deprived of normal means of employing capital in the country itself, the Egyptians sought foreign investments, putting their money to a large extent into British war securities. It was calculated that between Aug. 1914 and April 1920, as much as £E150,000,000[1] had been invested abroad. Yet at the same time Egypt (apart from the public debt) was still a debtor to foreign countries for a still larger sum, chiefly loans on mortgage and capital invested in industrial, transport and other companies. But the wave of prosperity—which depended to an unhealthy extent on the inflated price of cotton—was accompanied by very real distress among the *fellahin* (peasantry). The great increase in the cost of living acted upon this class (who form 62% of the pop.) with extreme severity, and their plight was accentuated by the natural tendency to extend the area under cotton cultivation at the expense of the area under cereals. The poorer classes in the big towns were even more affected than the fellahin; in Cairo in 1920 the cost of living was thrice as high as in the beginning of 1914. An attempt by the authorities to fix maximum prices was found to do rather more harm than good. The Government was reduced to seeing that certain staple articles of food—chiefly wheat, flour and maize—were supplied at reasonably cheap rates. Wheat had to be imported for this purpose and sold at prices involving a loss.

As one result of the increased cost of living there was a general demand for higher wages and improved conditions, and labour organizations resembling trade unions made their appearance. Many strikes occurred, some of long duration and some political rather than economic. A Labour Disputes Conciliation Board, established in Aug. 1919, did much good work in regulating questions of pay, hours of work, payments for sickness, etc.

The great drop in the price of cotton during the last half of 1920 naturally affected Egypt, and 1921 proved a year of considerable stringency. The restriction in the purchasing power of the community was a reflex of the fall in cotton. The price of Egyptian cotton (*sakel*) on the Liverpool market was 84·50d. in April 1920 and but 17·75d. in April 1921. The fall came too late to affect the trade returns of 1920, which were the highest recorded. The figures were largely delusive, as they were mainly the result of higher prices and not of increased production.

To a certain extent the poorer fellahin enjoyed advantages which protected them against the worst effects of bad harvests and low prices. By a law of 1912, passed at the instance of Lord Kitchener, holdings up to five *feddans*[2] were secured from distraint for debt, and as native owners of land of five feddans or less numbered at the 1917 census over 1,500,000, or about one-tenth of the total population, the benefit of the Five Feddans law was very appreciable. Moreover, the peasantry could obtain loans from the Agricultural Bank at the fixed rate of 8% interest.

Agriculture, Mining and Trade.—The Agricultural Department, established by Sir Eldon Gorst in 1910, was in 1913 transformed by Lord Kitchener into a Ministry of Agriculture. Cotton maintained its position as the mainstay of Egyptian prosperity. The crop of 1910 realized £E35,840,000, being £E5,700,000 above the previous best. The crops of 1908, 1909, and 1911 were, however, poor or medium, and steps were taken to put the industry on a sounder basis. Reclamation of land had been pushed northward in the Delta into low-lying areas where there was no natural drainage, while a middle zone had become salted and water-logged. Thus arose the necessity of drainage works on a large scale. Undrained soil, indiscriminate destruction of bird life[3] and the loss in seven years of a quarter of a million head of cattle through disease had led to a great increase in cotton pests, while a harmful system prevailed of mixing different varieties of cotton-seed for sowing. In Nov. 1912 a cotton congress was held in Cairo, representatives of master cotton-spinners from every European country and Japan being present. At this congress Mr. Dudgeon, director-general of the Agricultural Department, outlined a scheme whereby in five years seed for producing species approved by spinners could be obtained for the whole of Egypt. A Cotton Research Board was created in 1919 and in that year Mr. H. M. Leake, a leading authority on cotton-breeding, visited Egypt with the object of improving the quality and increasing the yield of the cotton crop. From 1916 the crop had represented practically only two varieties of cotton, *sakel* (72%) and *ashmuni* (20%)—the latter grown in Upper Egypt. The *Mitafifi* and *Nubari* varieties, 26% and 15% respectively in 1913, had shrunk in 1919 to 2·2% and 1·5%. The pressing and baling of the cotton are done almost exclusively at Alexandria.

The attraction of cotton caused the cultivator to restrict the areas under food crops; so much so that in 1915 and again in 1918 the Government was compelled to limit the area under cotton. The chief food crops are wheat, barley, maize, rice and sugar-cane. In 1919 the area under cotton was 1,573,000 feddans as against 1,274,000 under wheat. In 1916 the figures had been: cotton 1,677,000 feddans, wheat 1,075,000. The figures for the 1920 wheat crop were, however, illusory; in many instances wheat sown was rooted up, or allowed to be grazed by cattle, and cotton planted in its place. While the cotton crop varied considerably in amount the average annual production was about 315,000 tons. The crops of 1920 realized the unprecedented price of £E75,096,000, an increase of 15% in value over 1917, though a big decrease in quantity.

With a view to broadening the basis of the agricultural resources of the country decrees were issued (Dec. 1920–May 1921) prohibiting for the three years 1921–3 the planting of more than one-third of each holding with cotton. This action was taken at the request of the provincial councils.

From 1912 onward there was a notable development in the mineral wealth of Egypt. Nitrates and phosphates, the last-named from the Red Sea coast, together with a little gold, were up to then the chief mineral exports. Petroleum was known to exist on both shores of the Gulf of Suez but it was not till 1912 that the export of crude oil began. This oil was from the Gemsa mines. In 1914 a new oil-field was discovered at Hurghada and the oil from this field did much to save Egypt from a fuel famine during the World War. This led the Government to undertake drilling operations on its own account, but up to the close of 1920 the stage of production from Government mines had not been reached. The value of the mineral output (in its raw state) rose from £E400,000 in 1914 to £E1,420,000 in 1919. Oil refineries were erected at Suez where, in 1916, harbour extensions were carried out to provide for the increase in the oil trade and the bunkering of oil-burning ships. The output of petroleum rose from 12,700 metric tons in 1913 to 281,800 tons in 1918. Phosphate was next in importance among minerals. The output varied greatly; it was 104,000 metric tons in 1913, rose to 125,000 in 1916, fell to 31,000 in 1918 and was 78,500 in 1919. Manganese ores have been exported since 1913 but the mines were much damaged by the Turks in 1915–6. In 1918 the manganese ore mined was 27,498 tons, the export 9,400 tons.

Of other industries cigarette-making at Alexandria from imported tobacco—a business almost entirely in the hands of Greeks and Armenians—showed wide fluctuations. Before the World War the tobacco was obtained chiefly from Greece, Turkey and Russia. During and after the war the place of Turkey and Russia was taken by China, India and Japan. The tobacco imported in 1913 was 7,269,000 kilogrammes; in 1919 it was 8,350,000 kgm. The export of cigarettes, 493,000 kgm. in 1913 fell to 285,000 kgm. in 1917, but rose to 561,000 kgm. in 1919.

The external trade of Egypt in the decade 1911–20 rose from £E55,826,000 to £E187,348,000, the figures for 1920 being the highest recorded. Imports in that year were £E101,880,000 and exports £E85,467,000. They compared with the previous highest returns of £E51,156,000 imports in 1918 and £E75,880,000 exports in 1919. There was a great increase of imports, following the removal of war restrictions, in 1918–20, but the rise was more in values than in quantity. In 1911 the balance of trade had been almost even, exports being £E28,598,000 and imports £E27,227,000.

As to exports, cotton, throughout the decade, represented 90% of the total; the other chief exports were cereals and vegetables, sugar, cigarettes and, from 1913–4, minerals. The largest exports in 1920, after cotton, were cotton seed and cakes, £E4,087,600; sugar, £E1,144,000; and cigarettes, £E951,000. The chief imports were cotton textiles (valued at £E18,771,000 in 1920), metal and metal ware (£E11,842,000), coal (£E8,315,000), wheat and flour (£E9,443,-

[1] £1 0s. 6d. approx.

[2] One feddan = 1·038 acres.

[3] In 1912 a law was passed for the protection of birds useful to agriculture. Many of these birds, such as the buff-backed heron (egret), had been almost exterminated. The new law proved effective and these birds again multiplied.

000), and tobacco (£E3,184,000). Much of the coal imported in 1919 and 1920 came from South Africa and Australia.

Alexandria is the principal centre of trade, taking normally over 90% of the total. Its share in 1913 was 91·8%. In that year Port Said had 11% of imports and 1% of exports. War conditions caused Port Said (and Suez) to obtain, temporarily, a much larger share—25%—of the trade, but in 1919 Port Said had dropped to 18% of imports and under 4% of exports. In that year Alexandria took 87·9% of the total trade.

The following table of the trade of Alexandria for 1913 and 1919, showing the chief importing and exporting countries, may be taken as showing the economic relations of Egypt as a whole. The most noticeable features of the table are the entry of Japan into the Egyptian market and the increasing competition of the United States. Japan first appeared as a customer in 1916.

(Values in round numbers of £E1,000.)

	1913			1919		
	Imp't from	Export to	Total	Imp't from	Export to	Total
United Kingdom	7,700	13,500	21,200	21,800	40,000	61,800
Germany	1,500	4,000	5,500	10	240	250
France	2,300	2,800	5,100	2,400	5,900	8,300
Austria-Hungary	1,900	1,700	3,600	—	—	—
Russia	900	2,200	3,100	—	—	—
United States	500	2,500	3,000	2,900	16,700	19,600
Italy	1,400	1,000	2,400	2,500	3,500	6,000
Turkey	1,900	500	2,400	—	—	—
Switzerland	130	1,000	1,130	430	650	1,080
Belgium	1,100	100	1,200	—	—	—
Greece	500	50	550	1,900	700	2,600
British India	500	30	530	2,350	600	2,950
Japan	—	—	—	1,700	1,900	3,600

The share of the United Kingdom and of British possessions in the import trade of Egypt as a whole was 37·6% in 1913 and 58·2% in 1919. In the last-named year the United States came next with 6·1% of imports, being followed by Italy, France and Greece. In 1913 the United Kingdom took 43·1% of exports, Germany 12·8%, Austria 5·6% and the United States 7·9%. The British share of the exports in 1919 was 54·3%, that of the United States 22% and of France 7·7%. The increase of United States trade was largely due to the demand for cotton; of the 1920 crop the U.S. took 35%, compared with 42% taken by the U.K. and 10% by France.

The value of merchandise in transit during 1920 was £E13,000,000 as compared with £E21,000,000 in 1913. It consisted almost entirely of coal and petroleum and passed largely through Port Said. Re-export trade (entrepôt), to which the geographical situation of Alexandria is peculiarly favourable, was valued at £E2,500,000 in 1920 compared with £E500,000 in 1913, and consisted mainly in the export of textiles, metal goods, kerosene, oil fuel and vegetable oils to adjacent countries of the Levant, notably Syria and Palestine.

Shipping.—The tonnage of ships entering Alexandria in 1911 was 4,095,000, the British share being 39%, Austria-Hungary coming next with 10%. In 1913 the tonnage was 3,718,000, a figure nearly maintained in 1914. During the World War the commercial tonnage greatly dwindled and in 1918 was 738,000 tons, of which 527,000 tons were British. The British passenger services were completely disorganized and this traffic was in 1919 almost wholly absorbed by Italian companies, notably the Lloyd Triestino (formerly Austrian Lloyd). Including vessels in transit through the Suez Canal, but excluding warships and all vessels on military service, the shipping figures for 1918—Alexandria, Port Said, Suez and all minor ports combined—were: Steamers entered, 2,108; tonnage, 5,329,000; steamers cleared, 2,161; tonnage, 5,489,000. Sailing vessels entered, 422; tonnage, 20,000; cleared, 463; tonnage, 25,000.

War and post-war developments included the establishment of regular lines of cargo steamers by Japan, Norway and the United States. Trade with the United States was still, however, maintained mainly by British ships.

Railways, Telegraphs, etc.—In 1915–6 the Egyptian railway system was prolonged from Salhia to Qantara on the Suez Canal, whence a line was built (originally for military purposes) across the Sinai Peninsula parallel to the coast, and was later continued to Jerusalem and Haifa. A steel swing-bridge over the Suez Canal at Qantara, completed in May 1918, gave through communication between Cairo and Jerusalem, but at the end of 1920 the Suez Canal Co. pressed for the demolition of the bridge on the ground of its interference with the canal traffic. The bridge was taken down by May 1921; while the question of a permanent alternative means of transit was being studied, a floating transporter carried goods across the canal in the railway trucks without break of bulk.

The railways suffered severely during the war owing to heavy military demands and had not in 1921 recovered from the overwork and arrears of maintenance. There was no considerable renewal of permanent way in the period 1914–20. This caused increased use of the canals, notably the Mahmudia Canal, which runs from the Nile at El'Atf to Alexandria. It is open to navigation throughout the year and has wharfage at Gabbari (the Alexandria goods station). In 1919 the building of short lines to give the Delta towns better access to Alexandria and Port Said was under consideration.

Wireless telegraph stations were erected at Cairo and Assiut and aerodromes laid out at Alexandria, Cairo and other towns, some of which served as stations on the trans-African route. In April 1919, a Ministry of Communications was formed, which took over control of railways, telegraphs, telephones, the post-office, ports and lights, etc., including air service. The telephone system had then recently been purchased by the State from a private company.

Irrigation.—The task of raising the Assuan dam was completed in 1912. The regulator at the head of the Menufia Canal—built about 1850—having suddenly collapsed in Dec. 1909, a new regulator had been built by Messrs Aird & Co. by July 1910, in time for the Nile floods. In 1912 extensive works for improving the irrigation and drainage of the Delta were begun; their completion was delayed by the financial stringency caused by the outbreak of the World War.

In 1916 the Egyptian Government in conjunction with the Sudan Government began investigations for new irrigation works on a larger scale. The scheme, approved in 1920 after much criticism, included the construction of a dam at Gebel Aulia, near Khartum, with a storage capacity double that of the Assuan dam, and of a barrage near Nag Hamadi in Upper Egypt. The object as defined by Lord Allenby in 1920 was to "permit the perennial cultivation of the remaining waste or basin areas of Egypt, amounting to some 1,900,000 ac. which are now uncultivated, and 1,200,000 ac. which under basin irrigation produce one crop a year." The works were also intended to reduce danger from floods. (*See* SUDAN.)

Education.—In 1917 census returns showed that 8% of the population over five years of age could read and write as against 6% in 1907. These figures hardly reflect the desire for education among all classes. The provincial councils, which since 1910 have had part control of elementary education, showed in many instances keen interest in their work. A commission presided over by Adly Pasha, then Minister of Education, reported in 1918 that the existing schools were inadequate and outlined a scheme for sites and buildings costing over £12,000,000, with an ultimate maintenance cost of some £2,000,000 a year. In 1916 higher elementary vernacular schools were established by the Ministry of Education; in 1920 the Ministry maintained 6 and the provincial councils 18 such schools. In that year the Ministry of Education had 54 girls' elementary schools—increased interest by mothers in the education of their daughters was a feature noted by the authorities in the report for 1919. "A few years ago," it was recorded, "it was rare to find a mother taking a direct personal interest in the welfare of her daughter at school; this was left to the father who . . . often had to overcome maternal opposition to (his daughter's) education." In 1917, 18 per 1,000 of the female population above five years could read and write compared with 3 per 1,000 in 1907. The corresponding figures for males were 85 per 1,000 in 1917 and 120 per 1,000 in 1907. In Feb. 1920 219,642 boys and 42,911 girls attended *maktabs* (elementary schools) under Government control or inspection.

In secondary and higher education there were no great developments during 1910–20, and no effective steps were taken to found the proposed State university. Much injury to education was caused by the strikes, for political reasons, which began among the students in many higher and secondary schools in March 1919.

Finance.—The revenue in 1911 was £E16,793,000, exceeding that of 1910 by £E827,000 and that of 1907 (the highest figure previously recorded) by £E425,000. Expenditure in 1911 was £E14,872,000. During 1913 the Domains loan was extinguished and the profit on the working of the domains became available for general purposes. The revenue had increased to £E17,368,000 by 1913 and expenditure to £E15,728,000. The effect of the outbreak of the World War was seriously to contract revenue and to necessitate great economies and the finding of new sources of income. The accounts for 1914–5 showed a deficiency of £E1,468,000. The recovery in the price of cotton and the expenditure of the British army stationed in Egypt, however, enabled the Finance Ministry to show a surplus of £E1,165,000. By 1919–20 the revenue had risen to £E33,677,000 in which year expenditure was £E28,991,000. On April 1 1920, the general reserve fund stood at £E15,576,000. Meantime, in 1917–8, the Egyptian Government had taken over charges amounting to about £E3,000,000 incurred by the Egyptian Expeditionary Force. The budget for 1920–1 (the financial year ending March 31), framed when cotton was at its highest price and trade increasing, was estimated to balance at the unprecedented figure of £E40,271,000. This included a sum of £E5,654,000 on new works. During the year the great fall in the price of cotton occurred, with a general contraction of trade, while food subsidies and emergency purchases of coal were a great drain on the revenues. The year closed with a deficit of £E12,900,000. This was made good out of the general reserve fund, which in April 1921 was reduced to £E3,000,000. The budget for 1921–2 was framed to meet the altered economic position. Revenue was estimated at £E36,701,000, and expenditure at £E38,682,000 with a draft on the general reserve fund to balance accounts.

The public debt stood on Dec. 31 1919 at £93,299,000 sterling, of which £5,282,000 was held by the Government and £88,017,000 was in the hands of the public. Interest on the debt was £3,550,000.

Administration.—In 1913 the two legislative bodies, the General Assembly and the Legislative Council, were replaced by a single body called the Legislative Assembly consisting of (1) Cabinet ministers; (2) 66 elected members; and (3) 17 members nominated to represent minorities. Members were to hold their seats for six years, one-third being elected every two years. The Legislative Assembly met in 1913 and had a somewhat stormy session. In 1914 martial law was proclaimed and there were no further sittings of the Assembly.

On the proclamation of the British protectorate (Dec. 4 1914) a High Commissioner replaced the British consul and agent-general. The then ruler, the Khedive 'Abbas Hilmi, was deposed and his cousin Husein Kamel, a son of the Khedive Isma'il, was placed on the throne with the title of sultan; on Husein's death his brother Ahmed Fuad Pasha became sultan (Oct. 9 1917). The capitulations continued in force pending the elaboration of measures which satisfied foreign Powers that under a new judicial system the interests of their subjects would be safeguarded. (*See* below, *History*.)

The most useful records of the finances, administration and social and economic condition of Egypt are the Reports of the British Agent-general published annually in London down to 1914. In 1920 appeared a Report from the High Commissioner covering the period of 1914–9, a report to which the present writer is indebted. Detailed information is given in annual reports of the various Egyptian ministries issued at Cairo. For a recent study of the Copts see S. H. Leeder, *The Modern Sons of the Pharaohs* (1918). See also M. S. Briggs, *Through Egypt in War Time* (1918).
(F. R. C.)

POLITICAL HISTORY 1909–21

The Pre-war Period.—The policy of entrusting the Egyptians with a larger administrative responsibility was initiated under Sir Eldon Gorst, who succeeded Lord Cromer as British Agent and Consul-General in 1907. Considerable success attended the extension of ampler powers to provincial councils, which in 1909 took over the direction of elementary education. But a sufficient period of time did not elapse before his premature death in 1911 to give the experiment a fair trial, and the new policy, which was generally interpreted in Egypt as an attempt to conciliate opposition by concession, rather stimulated than discouraged Nationalist agitation. In Feb. 1910 Boutros Ghali Pasha, the first Copt to attain the rank of Premier, was assassinated by a young Egyptian of the Nationalist party, which proclaimed the murderer a patriot and provoked demonstrations during his trial. Their influence had affected the General Assembly, which displayed its anglophobia by rejecting a proposal to extend the existing concession of the Suez Canal Co. after its expiry in 1968. The British Agent was compelled to recommend drastic measures to stop anti-British manifestations and Sheikh 'Abd el 'Aziz Shawish, the moving spirit behind them, was expelled from Egyptian territory. It is significant that he established his residence in Berlin. Mohammed Said Pasha became Prime Minister and Jusuf Saba Pasha, hitherto Director-General of Posts, joined the Cabinet. A long-felt want was supplied in 1910 by the creation of an Agricultural Department under the Minister of Public Works. After the murder of Boutros Pasha the tension between Copts and Moslems increased and a Coptic Conference held at Assiut in March 1911 drew up a memorandum preferring complaints of unfair treatment which the British Agent was unable to regard as justified. Sir Eldon Gorst, who had long been in failing health, requested to be relieved of his functions early in July 1911 and a few days afterwards he died. His long and intimate knowledge of the country lends special importance to his final report for 1910, in which he recognized that the Legislative Council and General Assembly had become instruments of agitation against the occupying Power and that the new policy had failed.

It might be open to question how far it would generally be opportune to appoint a former servant of the Egyptian Government to be representative of Great Britain in Egypt. An exception was, however, certainly justifiable in the case of Lord Kitchener, who had, moreover, been employed for many years elsewhere and who enjoyed exceptional prestige. He arrived in Egypt at the end of Sept. 1911. A fortnight later the Italian landing in Tripolitania followed a declaration of war with Turkey. Egypt was at once declared neutral. H.M. Government contested on behalf of Egypt the claim of Italy to blockade the coast up to a point 100 m. E. of Sollum, that post, which was occupied by an Egyptian force, being regarded as the limit of her western frontier. In spite of a general feeling of sympathy with a Moslem belligerent, intensified by geographical proximity and racial kinship, the Egyptian people displayed self-control, and neutrality was strictly observed. But the Libyan War had the effect of stimulating the patriotic sentiment which is largely a patriotism of Islam. The anarchical spirit displayed by the murder of Boutros Pasha was again revealed in July 1912, when a plot was detected to murder the Khedive, Lord Kitchener and the Prime Minister.

Lord Kitchener's energies were first devoted to the needs of the Egyptian peasantry. A law was introduced exempting small holdings up to 5·15 ac. from distraint for debt, while usurious money-lending at more than 9% was made punishable by fine and imprisonment. Boards of local magistrates were instituted to summarily decide trivial cases and avoid costly suits. Steps were taken to preserve the bird life so necessary to keep down cotton pests. Thanks to his efforts the beautiful egret, which was rapidly being exterminated, has once more become conspicuous in the fields. A representative international cotton congress was summoned to meet at the end of 1912. In that year Mohammed Said lost the services of Sa'd Zaghlul Pasha, his Minister of Justice, who subsequently became the leader of the Nationalists. But his administration was strengthened in 1913 by the formation of two new ministries, those of Waqfs (*see* 17.413) and Agriculture. Tension with the Khedive, however, led to his resignation in 1914. He was succeeded by Husein Rushdi Pasha, who remained in office throughout the period of the World War.

New Legislative Assembly.—The salient measure of Lord Kitchener's administration was a revision of the Organic Law of 1883 and the institution of a Legislative Assembly on a broader electoral basis than that of the old Legislative Council and General Assembly. Under the previous system the villages appointed representatives by manhood suffrage to elect provincial councils. The provincial councils returned 14 members from their own body to represent the provinces in the Legislative Council, to which 12 more were nominated by the Khedive. The council of 26, with the ministers and 46 other delegates elected by the village representatives, constituted the General Assembly. All laws and decrees before approval had to be submitted to the Legislative Council, which could invite information, submit petitions and criticize the budget. The General Assembly, with similar powers of discussion and criticism, met at rarer intervals. Its concurrence was necessary for any measures involving fresh taxation, but it had no power to initiate legislation. There was no justification for the existence of two bodies performing practically the same functions, and the inclusion of members of the provincial councils, whose duties were entirely different, was an anomaly. A single Legislative Assembly was now substituted for these two bodies, with considerably extended powers, including that of initiating measures on its own responsibility. It was made incumbent on the Government to justify persistence in legislation disapproved by the majority, and machinery was also introduced enabling the Government to directly consult the electors in regard to proposals rejected by the Assembly. The electorate was based on the old register, with the addition of all newly qualified voters, and numbered some two millions. Electors were divided into groups of 50, which returned delegates to carry the vote of each group to the poll.

Three weeks elapsed between the choice of delegates and the final elections. The first Assembly consisted of 49 landowners, 2 lawyers, 3 religious dignitaries and one engineer. The president and one vice-president were appointed by the Government. As elective vice-president Sa'd Zaghlul Pasha, who was already hailed by the opposition press as the champion of

Egyptian liberty, was chosen by an overwhelming majority. He led a bitter attack against Mohammed Said and indirectly against the British Agency in the early debates. The hostility of the new Assembly received encouragement from the Khedive, who now acted in complete understanding with the Nationalists.

Egypt during the War.—On the outbreak of the World War in 1914, and the change that was made in the status of Egypt, the sittings of the Assembly were suspended, and the term of its mandate expired without their having been renewed. Lord Kitchener was absent from Egypt on leave when Great Britain entered the war, and he never returned there, his services being demanded at home, where he was appointed War Minister. On Oct. 1 1914 enemy subjects were ordered by the G.O.C. in chief, Sir John Maxwell, to register themselves, and German or Austro-Hungarian male subjects of military age, or under suspicion, were deported to Malta. A proclamation of Nov. 2 placed Egypt under martial law. This enabled administrative measures to be enforced without reference to the Legislative Assembly and, where foreign subjects were concerned, without the elaborate procedure for obtaining the consent of foreign Powers. A further proclamation on Nov. 6 notifying a state of war with Turkey announced that Great Britain would take upon herself the sole burden of the war "without calling on the Egyptian people for aid therein." A number of Egyptian artillery nevertheless volunteered for service in defending the canal and took part in the repulse of the German-Turkish offensive, which was not supported by any movement in Egypt itself. Volunteer labour battalions were also raised, which played an important part in the conduct of the war. From 1917 onwards an Egyptian force, enrolled under the Frontier Districts Administration with British officers, maintained security and suppressed contraband in the Arabian and Libyan desert zone, hitherto patrolled by the coast-guards.

As the Egyptians were nominally subjects of the Sultan the entry of Turkey into the World War as the enemy of the occupying Power created an intolerable situation which demanded immediate settlement. Turkish suzerainty might have been determined by the annexation of Egypt to the British Empire. But it was decided rather to proceed along existing lines and to place Egypt under British protection. By a proclamation issued Dec. 18 the Secretary of State for Foreign Affairs gave notice that, "in view of the state of war arising out of the action of Turkey, Egypt is placed under the protection of His Majesty, and will henceforth constitute a British Protectorate. The suzerainty of Turkey over Egypt is thus terminated and His Majesty's Government will adopt all measures necessary for the defence of Egypt and protect its inhabitants and interests." A second proclamation issued the following day announced the deposition of the Khedive, 'Abbas Hilmi, who was in Constantinople, on the ground of his adherence to the King's enemies, and the acceptance of the succession by his uncle Prince Hussein Kamel, who was henceforth to bear the title of Sultan of Egypt. The arbitrary and corrupt methods of the deposed Khedive had rendered him generally unpopular with Egyptians, who had also little reason to regret the severance of the last link with Turkey. At the same time Mussulman feeling could not be indifferent to the danger which threatened the caliphate, and German agents had freely promised the eventual liberation of Egypt from British control after the victory which they confidently predicted. Sultan Hussein's position was therefore no easy one, in spite of the personal respect which he commanded.

Sir H. McMahon, High Commissioner.—The new status of Egypt was nevertheless introduced without disturbance, if without enthusiasm, under the direction of Sir Milne Cheetham as acting High Commissioner, pending the arrival early in 1915 of Sir Henry McMahon, who had been selected for that post. The British representative now took over the direction of foreign affairs and the Egyptian minister disappeared.

The complete failure of the Turkish attack on the Canal had its effect on public opinion, and as time went on the Sultan's personal popularity increased. On the other hand the Russian retreat, the failure of the Dardanelles attack and the final withdrawal produced some reaction and confirmed the general impression of German invincibility. In April and again in July 1915 attempts were made on the life of the Sultan. In justice to the Egyptians, however, it should be recorded that, whatever anticipations had been raised among them as to the outcome of the war, they bore with patience and goodwill the unwelcome disabilities which it entailed, and laid Great Britain under obligations both moral and financial. Requisitions of cereals and of live stock, the control imposed on the price of cotton, recruiting for the labour and the camel transport corps, without which the Palestine campaign could not have been brought to a successful conclusion, and finally the assumption by the Egyptian Government of the whole liability for expenditure on services connected with the war, held over in a suspense account which reached £3,000,000, constituted a British obligation for which too little credit was given.

Nationalist Propaganda.—The war had entailed the recall of a great number of British officials from Egypt for service elsewhere, and not only was much abusive action by uncontrolled local agents ascribed to British pressure, but a free field was left open for Nationalist propaganda, which had grown ever-increasingly active as the generation died out which had experienced the pre-occupation régime. Nationalist sentiment, legitimate and worthy of sympathy in itself, might have assumed a moderate and healthy form had it not from the first received an anti-British impulse from rivalries and jealousies among the Western Powers, making use of the indeterminate position of Great Britain as a serviceable political weapon. The situation was considerably modified by the Anglo-French understanding of 1904. But the Nationalist movement founded by the late Mustafa Kemal and fanned by Sheikh Shawish and others, had assumed a definitely anti-British colour, which the ex-Khedive had at one time exploited for his own personal ends. The members of a dissatisfied civil service, who regarded the presence of an ever-growing number of British officials in the higher posts as a bar to their promotion and interest, swelled the ranks of the Nationalists, reinforced by the students, who felt that their prospect of obtaining State employment, to qualify for which they had often made real sacrifices, was diminished by the competition of the foreigner. The lawyers, a very numerous class, who anticipated that the protectorate would entail a modification of the judicial system prejudicial to their situation, were unanimously hostile, as indeed were the members of all the professional classes. Not only had British officials increased in a manner which seemed disproportionate to the expanding activities of the departments and hardly consistent with the principle of training Egyptians to manage their own affairs, but, in contradiction of that very principle, they had tended to absorb administrative functions and not merely to advise. With increasing numbers they had become a community living their own lives, wholly aloof from the Egyptians and the other foreign communities, and with this loss of contact their influence and moral control had weakened. Finally, the war between Great Britain and Turkey, the seat of the caliphate, had emphasized the latent but always present impatience of the Moslem under Christian rule. The strength which the Nationalist movement continued to acquire during the earlier and middle phases of the war does not seem to have been sufficiently realized.

Sir R. Wingate, High Commissioner.—In Dec. 1916 Gen. Sir Reginald Wingate, who had filled the posts of Sirdar of the Egyptian army and Governor-General of the Sudan since Dec. 1899, was called to Cairo as High Commissioner in succession to Sir Henry McMahon. The health of Sultan Hussein, which had for some time caused anxiety, did not improve and it became urgent to settle the question of succession, left in abeyance in 1914. Prince Kamel ed Din, his only son, who had married the sister of the ex-Khedive, finally declined the position of heir-apparent, which was then offered to Prince Ahmad Fuad, the sixth son of the Khedive Isma'il. He had been educated at Turin, where he passed through the military school

Sultan Hussein died Oct. 9 1917. The removal from the scene of a ruler remarkable for his character, public spirit and thorough knowledge of his own country was a misfortune for Egypt. Certain modifications in the Ministry, in which it was proposed to include Sa'd Zaghlul Pasha, were considered after the accession of the new Sultan. But eventually only one resignation took place, Fathi Pasha, Minister of Waqfs, being replaced by Ziwar Pasha, the Governor of Cairo. But the discussions engaged in made it clear that the Prime Minister intended on the conclusion of peace to raise the question of autonomy and the regulation of Egypt's relations with Great Britain by convention.

After-war Plans.—As the World War drew to a close the principles formulated by the President of the United States, to which Great Britain and her Allies subscribed, had a far-reaching and even a decisive effect on educated opinion in Egypt. The numerous declarations of British statesmen, disclaiming any intention of permanently occupying the country, were insistently recalled, and the aspirations of the Egyptians to govern themselves were represented as having received international sanction through the acceptance of the principle of self-determination. Such sentiments were by no means confined to the discontented and the ambitious, who in the furtherance of their political aims would even have welcomed a German victory. Moderate opinion also adopted the view that the attitude of Egypt during the war and the sacrifices made by her people justified a claim for special consideration and that the time had come to reconsider the relations between their country and Great Britain. When in Nov. 1918 an Anglo-French declaration was published announcing that the policy of the Allies in the East contemplated the complete enfranchisement of the peoples so long oppressed by Turkish rule and the "institution of national Governments and administrations deriving their authority from the initiative and free choice of the local populations," Egyptians felt their title to manage their own affairs to be as good as that of Syria and Mesopotamia. They, moreover, regarded their own country with its progressive organization and western methods as far ahead in development of Arabia, where an independent kingdom had already been established. At the moment when concrete expression was being given to these sentiments certain other factors combined to excite public opinion. Early in 1918 a commission had been appointed under the presidency of the Prime Minister to consider the future organization of the Legislative Assembly in Egypt. Sir W. Brunyate, the Judicial Adviser, who during the long illness and after the death of Lord Edward Cecil also acted as Financial Adviser, was requested by the commission to prepare a basis for discussion and to consider the question of the participation in legislation of the foreign colonies, in view of an eventual abolition of the Capitulations. Another commission had already for some months been discussing the judicial reforms which such a measure would entail, and an impression which gained ground that in any new courts replacing the mixed tribunals the English language and legal procedure would predominate had confirmed the hostility of the legal profession in Egypt. The memorandum regarding the Legislative Assembly was submitted to the Prime Minister in Nov. 1918. Though only intended as a basis for confidential discussion its contents became known and were regarded as having the approval of H.M. Government. The project was interpreted as restricting the Assembly to consultative functions while all legislative power was to be vested in a Senate, in which the members officially appointed with a group of elected foreigners would constitute a majority. Its divulgation roused a storm of indignant protest.

Aspirations for Autonomy.—A Nationalist committee was formed at the end of 1918, under the chairmanship of Zaghlul Pasha, who now definitely became the leader of the party. On Nov. 13 he paid a visit to the High Commissioner and expressed the desire to go to London to put forward a programme of complete autonomy, a proposal which was rejected as calculated to serve no good object. At the same time the Prime Minister, with the approval of the Sultan, proposed that he should himself proceed to London with the Minister of Education, Adli Pasha Yeghen, to discuss the affairs of Egypt, urging that, as the Peace Conference would give official sanction to the protectorate, its nature could not be left indeterminate. Sir R. Wingate appealed for their reception with some insistence. But as the Foreign Secretary and other Ministers were shortly leaving for the Peace Conference and would be unable to devote sufficient time and attention to the problem of Egyptian internal reform, they were invited to defer their visit which would not at that moment be opportune. The real urgency of the issue and the danger involved in postponing its consideration appear still not to have been fully appreciated. Rushdi Pasha together with Adli Pasha then tendered their resignations. Every effort was made to induce the two ministers to remain in office and an approximate date was eventually suggested for the visit. But the ministerial crisis was still unsolved when in the middle of Jan. Sir R. Wingate was summoned to London to report personally on Egyptian affairs. He pressed for the immediate reception of the ministers and the withdrawal of restrictions on the movement of Nationalist leaders. The contentions of the Nationalists, to whom many of the moderates had rallied, were now receiving so much general support in the country that the ministers were only disposed to repair to London provided similar facilities were accorded to Zaghlul and his colleagues. As the latter were now openly engaged in a campaign aiming at the severance of all connexion between Egypt and Great Britain, their reception by the Foreign Office could not be entertained. On the other hand the invitation to the ministers was renewed. Rushdi Pasha, however, adhered to his resignation, which was accepted.

Meanwhile documents addressed to the foreign representatives and residents in Egypt announced that a delegation of 12 members, under the presidency of Sa'd Zaghlul, had been formed to lay before other countries the legitimate aspirations of Egypt. On March 3 this delegation forwarded to the Sultan, who had declined to receive them, a petition which, though drafted with all the forms of oriental courtesy, maintained the nullity of the protectorate and was clearly designed to intimidate His Highness and to prevent the formation of a new Government. Vigorous action was therefore taken without delay. On March 8 Zaghlul Pasha and three of his principal adherents were arrested and deported the following day to Malta.

Disturbances in 1918–9.—The immediate effects of this assertion of authority revealed the gravity of the internal situation. Anti-British demonstrations by the students in Cairo rendered military intervention necessary. On March 12 there were serious disturbances at Tanta and during the following days similar outbreaks occurred in the Delta provinces, characterized by looting and attacks on British soldiers and civilians. Railway lines were simultaneously torn up in different places, in accordance, it would appear, with a plan originally prepared for a rising had the Turkish attempt to cross the Canal proved successful. On the 16th Cairo was isolated by the severance of railway and telegraphic communication both with the Delta and with Upper Egypt, where foreign colonies were besieged in the quarter where they had taken refuge. On the 18th the fanaticism roused by the reports of unscrupulous agitators led to the brutal murder and mutilation at Deirut station of a British inspector of prisons, two officers and five of other ranks. Mobile columns had been dispatched with all possible expedition to the disturbed areas and by March 26 the main lines of communication were reëstablished, the danger points were in military occupation and the situation well in hand. But it required the employment of considerable forces and stern methods of repression to restore order and prevent further bloodshed. The leaders had probably never contemplated such a serious upheaval and were alarmed at a situation which had passed beyond their control. But the Nationalist committee, which continued to sit after the deportation of Zaghlul Pasha, cannot escape responsibility for the effects of their propaganda. During these and subsequent manifestations the Egyptian police in the great cities carried out their duties in an exemplary manner. The army, with the exception of a few units, was in the

Sudan, which remained entirely unaffected by events in Egypt. The extent and influence of the Nationalist organization appear to have been underestimated, and the British authorities evidently did not anticipate that within a week after the deportation of the leaders the anti-British agitation would develop into a national movement, supported by elements from every class, including the Copts, many of whom were no doubt prompted by prudential considerations to proclaim their solidarity with the Mussulman. That the fellahin, a pacific peasantry which had derived the greatest benefits from the British occupation, should have been so readily led by agitation to commit acts of savage violence had occasioned some surprise.

The movement among the fellahin was only of a very partial character, and generally restricted to the neighbourhood of large centres. At the same time several factors had by the end of 1918 combined to create a spirit of discontent and some loss of confidence in the British administration, which was made responsible for all the grievances experienced during the war. Recruiting for the labour and camel transport corps was in its earlier and really volunteer stage not unpopular, as the good wages paid were a boon to the poorer people, who enlisted again and again on the termination of their engagements. But when the voluntary system ceased to produce a sufficient number of men administrative pressure was exercised and the local officials took advantage of the absence of control. Unscrupulous Omdas in many cases abused their position, accepting bribes for exemptions and sending their enemies to serve under methods resembling those of the press-gang, while alleging British pressure as their excuse. In spite of the good prices paid, the requisition of domestic animals pressed hardly on the small farmers, who had to part with their only means of transport. Still more resented was the requisition of cereals and the manner in which it was enforced. Requisition rates ranged lower than market rates, which tempted local officials to collect larger amounts than they were required to furnish in order to sell the balance at the higher price, while cultivators who grew no wheat had to buy their quota at the market rate and sell at requisition rates. The process of verification and repayment was inevitably slow and opened the door to abuses. Collections for British Red Cross Funds, intended to be purely voluntary, were enforced by officials seeking to acquire merit for the amounts realized in their districts, and were often regarded by the ignorant fellah as a contribution imposed upon him to the British war-chest. The prices of food, clothing and fuel rose to an unprecedented degree during the war, and the average wages of the labouring class became inadequate to meet the enhanced cost of living and supply the necessaries of life. Meanwhile the fortunate producer of cotton and the privileged foreigner were seen to be accumulating fortunes. The discontent thus engendered among the poorer peasantry created a favourable field for the agitator, who proclaimed that the removal of the British occupation would ensure prosperity.

Lord Allenby's Régime.—Lord Allenby, the C.-in-C. in Egypt, who had left for Paris on March 12 1919, was directed to return at once as special High Commissioner during the absence of Sir R. Wingate, with instructions to restore law and order and "to administer in all matters as may be required by the necessity of maintaining the King's Protectorate on an equitable basis." The situation now passed from one of active to one of passive resistance. A general strike was maintained for only a few days, but students, lawyers and a large number of public officials declined to resume their activities. Lord Allenby adopted a policy of conciliation and, notwithstanding the dangerous interpretation to which such a rapid change of policy was liable, the removal of the embargo on the free movement of Egyptians was approved. This entailed the liberation of Zaghlul and his associates interned at Malta, who left for Paris, where their arrival almost coincided with President Wilson's recognition of the British protectorate. Their efforts to obtain a hearing at the Peace Conference were disappointed. Punitive measures for the outrages perpetrated during the outbreak inevitably tended to maintain embitterment.

On April 9 Rushdi Pasha reconstituted a Ministry with Adli Pasha as Minister of the Interior. An additional Ministry to take charge of all communications was now instituted. But the life of the new Government was ephemeral and, having failed to terminate the official strike while deprecating intervention by the High Commissioner, Rushdi once more resigned on the 21st. A stern proclamation by Lord Allenby, acting as C.-in-C. under powers of martial law, which announced that all officials not returning to duty forthwith would be struck off the lists, had the desired effect.

Appointment of the Milner Mission.—H.M.'s Government now decided to send to Egypt a mission, under the chairmanship of Lord Milner, "to inquire into the causes of the recent disorders, and to report on the existing situation in the country and the form of the constitution which, under the protectorate, will be best calculated to promote its peace and prosperity, the progressive development of self-governing institutions, and the protection of foreign interests." Such were the terms of reference eventually drawn up. It would have been well if such a commission could have proceeded at once, while the impression of repressive measures was still strong, before the Nationalist movement had completed its organization, had exploited industrial unrest and extended throughout the country a propaganda which now received open encouragement from sections of the Arab university of El Azhar. But circumstances rendered its departure impossible before the autumn. A month after Rushdi's resignation, Mohammed Said Pasha (Prime Minister 1910–3) formed a new Ministry, in spite of the opposition which was henceforth to be anticipated to any combination from the Nationalists. Certain changes were also regarded as opportune in the British personnel. Sir Paul Harvey, who had resigned the position of Financial Adviser during Lord Kitchener's administration, returned. Sir W. Brunyate, who had acted in that capacity since the death of Lord Edward Cecil, also resigned his position as Judicial Adviser. Mr. Douglas Dunlop, Adviser to the Minister of Education, whose department had been much attacked, was replaced by Mr. R. S. Patterson, the Director-General of Accounts, as was Mr. Haines, the Adviser to the Interior, by Brig.-Gen. Sir G. F. Clayton, chief political officer to the Egyptian Force. A period of drift now ensued during which, though conditions appeared outwardly calm, the Nationalists continued to be active and to advocate a boycott of the Mission.

Among the arguments used to discredit the British administration much capital was made among the small landowners by the allegation of an intention to curtail the water-supply of Egypt in favour of the Anglo-Egyptian Sudan. A project had been adopted for the construction of barrages at Gebel Aulia and Sennar on the White and Blue Niles respectively. The former was designed to create a reservoir which would enable the remaining waste lands of Egypt, some 1,900,000 ac., to be cultivated, while extending *perennial* irrigation to some 1,200,000 more, now under *basin* cultivation, and therefore restricted to one crop in each year. The Blue Nile dam to be constructed near Sennar contemplated the raising of the river to a level necessary to feed a great canal which would irrigate the triangle south of Khartum known as the Gezira, approximately equal in area to the Egyptian Delta, and suitable for raising cotton. The unfortunate attacks made by Sir W. Willcocks and Col. Kennedy on Sir Murdoch Macdonald, Adviser to the Ministry of Public Works, which were shown by the report of the eminent irrigation experts serving on the Nile Projects Commission to be unfounded, did much to encourage these misrepresentations. Charges repeatedly preferred against the Adviser of having falsified figures to justify his proposals rendered inevitable a prosecution for criminal libel which ended in conviction.

The proposal to boycott the Milner Mission gained strength from the protest of the Prime Minister against its arrival before the signature of peace with Turkey, and his resignation which followed. Wahba Pasha, who had acted as Minister of Finance in the last two Cabinets, consented with no little courage to preside over a Ministry of Affairs.

Special Mission.—The special mission to Egypt was composed of Viscount Milner (chairman), Sir J. Rennell Rodd, Gen. Sir John Maxwell, Brig.-Gen. Sir Owen Thomas, Sir Cecil Hurst, and Mr. J. A. Spender, with A. T. Loyd and E. M. B. Ingram as secretaries. The mission arrived in Egypt on Dec. 7 1919. Every possible measure had been taken for its security in view of the attitude of organized antagonism which was at once openly manifested by strikes and street demonstrations in which even the Cairene ladies emerged from their seclusion to take part. Every effort was made to prevent Egyptians of note from coming into contact with the mission and those who did so were denounced in the local press. Tho headquarters of the mission were watched by pickets and the movements of individual members carefully followed, even into the provinces, with a view to preventing any contact with the people. Serious riots at Tanta followed a visit to that city, where military intervention became necessary.

During their stay in Cairo there was a series of attacks on British soldiers and no less than three attempts were made to assassinate Egyptian ministers by bomb-throwing. Soon after the arrival of the mission the chiefs of El Azhar University identified themselves with the Nationalists by a manifesto addressed to the High Commissioner, setting forth the claims of Egypt to complete independence and demanding the withdrawal of the British. A somewhat similar declaration signed by six princes of the khedivial family was sent in a letter to Lord Milner and simultaneously published in the press. The denunciation of the protectorate was the prevailing note.

The general hostility displayed was to some extent mitigated by a declaration issued on Dec. 20, in which the real aims of the mission were clearly stated. The belief that its object was to deprive Egypt of rights hitherto possessed was declared to be without foundation, and free expression of all opinion without limit to the field of discussion was invited. But the relations of the mission with the Egyptians were confined to informal discussion and conversations with individuals. These as time went on became so general that its members were able to thoroughly ascertain the current feeling of the country. A visit was paid by the mission to Alexandria, where its members were enabled to hear the views of the French, Italian and Greek as well as of the British Chamber of Commerce. An exhaustive inquiry was made into the working of every public department. The principal British officials were consulted, as well as the leading members of the non-official British community. Sir Cecil Hurst devoted a great part of his time to an investigation of the judicial system and the reforms which would become necessary to meet new conditions. Sir John Maxwell and Sir Owen Thomas also visited the Sudan. Before the departure of the mission in March 1920 a large volume of material had been collected, and certain propositions, on which remarkable unanimity was displayed, were provisionally drafted with a view to the preparation of a final report in England. While there had been no means of ascertaining how far a settlement on the lines contemplated would command general support in Egypt, it was clear that on certain points both extreme and moderate opinion were at one, and a solution on the basis of mutual agreement was obviously preferable to an imposed arrangement.

Milner-Zaghlul Agreement.—An opportunity presented itself in April, largely through the good offices of Adli Pasha, of which advantage was taken, to enter into relations with the Egyptian Delegation in Paris, who were now disposed to meet the mission in England. Meanwhile Wahba Pasha, whose health no longer permitted him to stand the strain of office, resigned on May 19 and was succeeded as Prime Minister by Tewfiq Nessim Pasha. Zaghlul with seven other delegates reached London on June 7 1920. Friendly relations were established with them and, after deliberations which extended to the middle of August, the general lines of an eventual settlement were drafted. But Zaghlul and his friends were not prepared to commit themselves to acceptance without reference to their supporters in Egypt, and four members of the delegation accordingly returned to Cairo with a memorandum outlining the bases on which an agreement might subsequently be framed. This memorandum, which came to be known as the Milner-Zaghlul Agreement, was in general accordance with the conclusions adopted by the mission in Egypt, though it went somewhat further, especially as regards the right of Egypt to foreign representation. A letter handed to Adli Pasha together with the memorandum made it clear that the latter had no reference to the Sudan, which lay outside the scope of the suggested agreement.

The proposals embodied in the memorandum may be summarized as follows:—

In order to establish the independence of Egypt on a secure and lasting basis it is necessary to define precisely the relations between Great Britain and Egypt and to modify the privileges and immunities now enjoyed by capitulatory Powers. Negotiations between accredited representatives of the Governments should contemplate:—a Treaty of Alliance between Great Britain and Egypt under which Great Britain will recognize the independence of Egypt as a constitutional monarchy with representative institutions, and Egypt will confer upon Great Britain the rights necessary to safeguard her special interests and to enable her to give foreign Powers guarantees which will secure relinquishment of capitulatory rights; Great Britain will defend the integrity of Egyptian territory, and Egypt will, in case of war, render Great Britain all assistance in her power within her own borders. This Treaty will stipulate that Egypt will enjoy right of representation in foreign countries, and in absence of an accredited representative confide interests to the British representative; Egypt will not adopt an attitude inconsistent with the alliance, or enter into any agreement with a foreign Power prejudicial to British interests; Egypt will confer on Great Britain the right to maintain a military force on Egyptian soil for the protection of her Imperial communications; Egypt will appoint, with concurrence of H.M. Government, a financial adviser, who will take over powers now exercised by commissioners of debt and be generally available for consultation; Egypt will similarly appoint a British official in Ministry of Justice, with access to minister, to have cognizance of all matters affecting foreigners and be available for consultation regarding maintenance of law and order; Egypt will recognize right of Great Britain to intervene in case of legislation operating inequitably against foreigners; British representative will have a special position and precedence over other foreign representatives; engagements of British or other foreign officers and officials may be terminated by either party within two years after the Treaty comes into force, with pension or compensation to be therein determined.

Further provisions contemplate:—approval by a Constituent Assembly of the Treaty, which would only come into force after foreign Powers have agreed to close their consular courts; a new organic statute securing ministerial responsibility to legislature, religious toleration and protection of rights of foreigners; conclusion by Great Britain of agreements with capitulatory Powers, rendering possible the extension to foreigners of jurisdiction of mixed tribunals and of Egyptian legislation; transfer to H.M. Government of rights exercised by foreign Governments under capitulations; maintenance of existing treaties to which Egypt is a party on matters of commerce and navigation; liberty to maintain foreign schools and organize religious and charitable foundations; elimination of international element in Alexandria Board of Health; validation of all measures taken under martial law; reorganization of mixed tribunals to undertake all jurisdiction hitherto exercised by foreign consular courts; communication by Great Britain of terms of Treaty to foreign Powers and support of application by Egypt to be admitted as a member of the League of Nations.

The four delegates returned from Egypt in Oct. and accompanied Zaghlul and his colleagues to London. They reported that the proposed settlement had been well received by the Egyptian public and that any attempted opposition had met with complete failure. At the same time they had been urged to support modifications of certain specific points. These contemplated a limitation of the functions of the Financial Adviser and of the officer attached to the Ministry of Justice; abandonment of a provision postponing the coming into force of the contemplated Treaty until agreements had been concluded with the Powers for the modification of the Capitulations, and a formal abolition of the protectorate.

The mission adopted the view that no good purpose could be served by further discussion of details at that stage. These points, on which they preferred to express no opinion, as well as others, could be raised when negotiations were opened. Zaghlul Pasha stated that his efforts to create a favourable atmosphere for settlement would be weakened if he could give no undertaking with regard to these reservations and especially the abolition of the protectorate. The Egyptian delegates then

left England and the mission concluded their report, which was forwarded to the Secretary of State for Foreign Affairs on Dec. 9 1920 and presented to Parliament as Egypt. No. 1 (1921).

After the Milner Report.—A period of suspense ensued during which the report was translated into Arabic. Its recommendations reëstablished the ascendancy of a moderate party in Egypt. After an effort to constitute a ministry representing a coalition of all parties, Adli Pasha accepted the task of forming an administration. His selection was in accord with the desire of the majority of the delegates who had visited London. It was then announced that "H.M. Government, after a study of the proposals made by Lord Milner, have arrived at the conclusion that the status of protectorate is not a satisfactory relation in which Egypt should continue to stand to Great Britain. While they have not reached final decisions with regard to Lord Milner's recommendations, they desire to confer with a delegation nominated by the Sultan with a view, if possible, to substitute for the protectorate a relationship which would, while securing the special interests of Great Britain and enabling her to offer adequate guarantees to foreign Powers, meet the legitimate aspirations of Egypt and the Egyptian people."

Zaghlul Pasha returned to Egypt from France on April 5 1921 and was received with great demonstrations of welcome. He at once took up a position of hostility to the new Government, and, though offered a place in the official delegation, was only willing to take part in it if he were himself appointed president. The majority of his former colleagues of the unofficial delegation then separated themselves from him. He declared the new Government not to be representative of opinion and a campaign of protest against the departure of the delegates was inaugurated. Moderate opinion in Egypt was unfavourable to his attitude and he only retained the support of the extremist and the turbulent elements in the country, who were, however, successful in producing demonstrations in Cairo and in Alexandria, in which city very serious riots took place on May 20, continuing through the two following days. They assumed the form of an anti-European outbreak, intensified by the nervousness of the European colonies and retaliation on their part against the demonstrators. The situation in Alexandria passed beyond the control of the Egyptian police and order had to be restored by British military intervention. Some 68 Egyptians and 10 Europeans were killed during the disturbances, and 162 Egyptians and 66 Europeans were wounded, the principal sufferers among the latter being Greeks. The effect of these riots, which were deplored by the majority of Egyptians, was to bring the question of the adequate protection of foreigners once more into prominence. Zaghlul Pasha indeed issued a manifesto deprecating attacks on foreigners and protested that the riots at Alexandria had nothing to do with politics. But the general tone of his subsequent utterances, his continued efforts to undermine the Ministry and to discredit the official delegation, only tended to bring home to him the responsibility for these unfortunate events. In the autumn of 1921 Adli Pasha visited London, where discussions took place between him and the Government as to the proposed new constitution; but an agreement was not reached, and he returned to Egypt without any further progress having been made.

Economic Situation 1909–21.—From the time of the economic crisis of 1907 the record of Egypt had been one of reviving and ever-increasing prosperity. The failure of the Bank of Egypt in 1911 and other failures about the same time were due to antecedent causes. The last of a succession of lean years with low Nile levels in 1910 was surmounted by the Government without recourse to a loan. The disabilities of the World War were more than compensated by the enormous prices realized for Egyptian cotton, which at one moment, in Feb. 1920, rose to 95d. per lb., ten times its pre-war price. The majority of Egyptian fortunes were invested in real estate and the competition for cotton land made £E400 a not uncommon price per feddan, while instances may be quoted of land which reached £E500 and even £E600. Previously to the war the Egyptian financial year ran from Jan. 1 to Dec. 31. It was then modified to bring it into conformity with the British financial year and has since run from April 1 to March 31 of the following year. In 1910 the budget figures were: revenue, £E17,177,107; expenditure, £E17,077,207. Five years later, for the financial year 1915–6, the increase was not very marked, the figures being: revenue, £E17,759,418; expenditure, £E16,594,666. But subsequently they rose by leaps and bounds, until for 1920–1 revenue and expenditure were both estimated at £E40,271,000. On the revenue side of this total £E35,675,000 represented ordinary receipts, while the balance of extraordinary revenue anticipated was derived from the sale of land and profits from the control of cotton. On the expenditure side £E32,616,920 represented recurring obligations; £E5,654,080 was assigned to new works and £E2,000,000 to loss on the purchase and distribution of articles of prime necessity. Upwards of seven millions of the increased expenditure was accounted for by the higher scale of remuneration assigned to all classes of government officials and the enhanced cost of materials. The estimated increase on state railways and the expansion of the police forces accounted for nearly two millions more.

In the course of 1920 the universal crisis in production and the cessation of demand for Egyptian cotton caused its price to drop precipitously and in March 1921 it stood at only a little above the pre-war figure. In spite of the fall of price there were few buying orders, less than 50% of the crop was shipped, and serious economic disturbance ensued. Tenants were unable to pay rents which had soared up with the high price of cotton, and landowners who had speculatively increased their acreage had to mortgage their estates. Goods, which had in 1919–20 been imported on a scale unprecedented in Egypt's foreign trade record in anticipation of a continued high purchasing power, remained unsold, and the bonded warehouses were overstocked with uncleared merchandise. On the other hand the general drop in the price of commodities relieved the situation of the labouring population, and the position was rendered less acute by the large profits accumulated during the preceding period by the class most affected by the paralysis of the cotton market. It was calculated in 1920 that Egyptian savings invested abroad, largely in British Treasury bills, might be reckoned at £150,000,000, more than the whole public debt.

The break in cotton prices inevitably affected receipts from customs, sales of land and other sources. At the same time the reduction in the acreage devoted to cereals had entailed large purchases abroad, while the menace of a fuel famine had made it incumbent on the Government to ensure the coal supply in spite of the high prices prevailing. The result was that, while the financial year 1920–1 closed with a revenue somewhat short of that estimated, approximately £E40,100,000, expenditure rose to £E53,000,000, of which £E8,940,000 was due to food supplies and £E6,460,000 to purchases of coal. Egypt was thus faced with a deficit of £E12,900,000, to be met by a draft on the Reserve Fund, which had greatly increased in the prosperous years 1917–20, and amounted, after due deductions for depreciation of stock, to £E15,942,866, leaving some three millions in hand to face a deficit on the budget for 1921–2.

While Egypt was enabled to meet this formidable deficit thanks to the accumulations of former years, the expansion of revenue had for a long time past fallen far short of the legitimate capacity and requirements of the country. The Egyptian financial system was inequitable and remained inelastic, owing to the impossibility of imposing taxation in proportion to wealth and of making it incident on foreign as well as on local subjects. The land-tax, when reassessed under the scheme of 1895, was fixed for a period of 30 years from the date of valuation. It was then calculated to represent about 28% of the rental value. Before many years had passed it had ceased in any way to approximate to that figure, but it could not be altered until the prescribed term had expired. Egypt, one of the richest countries of the world, remained, owing to a combination of circumstances, one of the most lightly taxed. Limitations on local taxation have similarly arrested municipal development. These disabilities have indirectly contributed to the increase of criminality by restricting the extension of the police force, while expenditure on public health and education has been inadequate.

The Egyptian debt on Dec. 31 1919 stood at £93,299,640, distributed between the three categories as follows: guaranteed loan, £6,199,900; privileged debt, £31,127,780; unified debt, £55,971,960. The Government and the commissioners of the debt held £5,282,260. The amount held by the public was thus reduced to £88,017,380. (J. R. R.)

EHRLICH, PAUL (1854–1915), German bacteriologist, was born in Silesia March 14 1854, of Jewish parentage. He was educated at Breslau and Strassburg, where he studied medicine. He was soon drawn towards research in chemistry, and in his earlier years carried out various important investigations in aniline dyes. He was at the same time winning fame as a bacteriologist, and in 1907 discovered a red dye, known as "trypan red," which effected the complete sterilization of animals infected with trypanosomes, a work of enormous importance for the treatment of diseases caused by these parasites. He considerably improved the technique of serum preparation, and also discovered a method by which the potency of the anti-diphtheria toxin could be tested. He also investigated the problems of cancer. Ehrlich's most famous dis-

covery, however, was made in connexion with his researches into venereal diseases. It was announced in 1910 that he had prepared an arsenical compound, known as salvarsan or "606," which was a cure for syphilis. He lectured in London in 1907, and in 1913 attended the medical congress held there. He received many honours from his Government and marks of distinction from almost every university and scientific society. He died at Homburg Aug. 20 1915.

See *Paul Ehrlich: eine Darstellung seines wissenschaftlichen Wirkens*, Festschrift zum 60. Geburtstage des Forschers (1914).

EICHHORN, HERMANN VON (1848–1918), German field-marshal, was born at Breslau Feb. 13 1848. He took part, as a young officer, in the campaigns of 1866 and 1870–1. In 1897 he was appointed chief of the staff of the VI. Army Corps at Breslau, in 1901 divisional and in 1907 corps commander. In 1905 he was promoted to the rank of general of the infantry and in 1913 to that of *Generaloberst*, while in the same year he was appointed inspector-general of the VII. Army Inspection at Saarbrücken. At the outbreak of the World War he was incapacitated in consequence of an accident, but was able to play a part in the battle of Soissons in Jan. 1915. In that month he was appointed to the command of the X. Army, which was engaged in the great battle of the Masurian Lakes in the following February. In Aug. he took Kovno and afterwards the fortresses of Grodno and Olita, and continued his victorious advance into Russia. From 1916–8 Eichhorn was in command of the army group known by his name in Courland. In Dec. 1917 he was raised to the rank of field-marshal and was sent to the Ukraine as chief-in-command of the German troops on the eastern front. He was assassinated at Kiev July 30 1918.

EINEM, KARL VON (1853–), Prussian general, was born at Hertzberg in the Harz Jan. 1 1853. He entered the Prussian army in 1870 and rose to the rank of major-general in 1900. In the same year he was entrusted with the organization of the German section of the international military expedition to Peking. In 1903 he was raised to the rank of lieutenant-general and appointed Minister of War, an office which he held till 1909. He had meanwhile been promoted to be a general of the cavalry, and in 1909 he was placed in command of the VII. Army Corps, which under Kluck he led in the advance through Belgium in 1914. In Sept. 1914 he was appointed to the command of the III. Army (the army of the Aisne), which he successfully handled throughout the heavy fighting in Champagne in Feb. 1915. He continued his defence of his section of the German position with this army throughout 1917 and the early months of 1918.

EINSTEIN, ALBERT (1879–), German-Swiss physicist, was born of Jewish parents at Ulm in the kingdom of Württemberg on May 14 1879. His boyhood was spent at Munich where his father, who owned electro-technical works, settled in the early 'eighties. The family migrated to Italy in 1894, whilst Albert Einstein went to the Cantonschule at Aarau in Switzerland, where he passed the *abiturienten* examination, the indispensable preliminary to any professional career in Central Europe, two years later. He attended lectures while supporting himself by teaching mathematics and physics at the polytechnic school at Zürich until 1900 and finally, after a year as tutor at Schaffhausen, was appointed examiner of patents at the patent office at Berne, where, having become a Swiss citizen, he remained until 1909. It was during this period that he took his Ph.D. degree at the university of Zürich and published his first papers on physical subjects. These were so highly thought of that in 1909 he was appointed extraordinary professor of theoretical physics at the university of Zürich. In 1911 he accepted the chair of physics in Prague, only to be induced to return to his own polytechnic school at Zürich as full professor in the following year. In 1914 his preëminence had become so evident that a special position was created for him in Berlin, where he was elected a member of the Royal Academy of Sciences and given a sufficient stipend to enable him to devote all his time to research without any restrictions or duties whatsoever. He was elected a foreign member of the Royal Society in 1921, having also been made previously a member of the Amsterdam and Copenhagen Academies, while the universities of Geneva, Manchester, Rostock and Princeton conferred honorary degrees on him.

Einstein's work is so important and has proved fertile in so many various branches of physics that it is not possible to do more than enumerate a few of the most salient papers. The work by which he is best known, the theory of relativity, was begun in 1905 with the publication of the restricted principle with its consequences (*see* RELATIVITY). Though considered fantastic by many, it had secured fairly general acceptance in Germany in 1912, and was followed by the generalized theory in 1915. But Einstein's work has been by no means confined to such abstract questions. One of his earliest publications gave the complete theory and formulae of the phenomenon known as Brownian motion, which had puzzled physicists for nearly 80 years. He showed that the heat motion of particles, which is too small to be perceptible when these particles are large, and which cannot be observed in molecules since these themselves are too small, must be perceptible when the particles are just large enough to be visible and gave complete equations which enable the masses themselves to be deduced from the motions of these particles. Much of his time again was spent on the obscure problems usually combined under the heading "quantum theory." The importance of these has become more and more evident, and the difficulty of reconciling the apparently inevitable discontinuities of the product of energy and time which experiment indicates, with our accepted habits of mind, always had a peculiar fascination for Einstein. Sooner probably than anybody else he realized the far-reaching implications of the theory propounded by Planck. His paper on the variation of the specific heat with temperature, which appeared in 1907, was the first extension of Planck's fundamental hypothesis, and its verification in essentials is one of the most convincing arguments in its favour. Numerous other papers on molecular physics, including an experimental research on magnetism, appeared in the *Proceedings* of the Russian Academy of Science, the *Physikalische Zeitschrift*, the *Proceedings* of the German Physical Society, the *Annalen der Physik*, etc. (F. A. L.)

EISNER, KURT (1867–1919), Bavarian Socialist politician and author, was born in Berlin on May 14 1867. He became a journalist, and at an early stage of his career had the first of his many experiences of imprisonment for the subversive tendency of his writings. He was successively on the editorial staff of the *Vorwaerts* in Berlin 1898–1905 and of other socialist newspapers at Nürnberg and Munich. On the outbreak of the World War he at first seemed to be going to side with the Government, but, after having obtained some private knowledge of the way in which German public opinion had been duped, he turned against his own party, the Social Democrats, and attacked them for supporting the war. In Jan. 1918 he was prosecuted at Munich on a charge of treason for inciting munition workers to strike. He was released from prison on the ground that he was a candidate for the Reichstag, and recovered his liberty in time to arrange the mass meeting on the Theresienwiese at Munich on Nov. 7 1918, which the same day led to the overthrow of the Bavarian monarchy, the flight of the King, and the institution of a Bavarian revolutionary Government under the presidency of Eisner. A red-haired Jew, he possessed a magnetic and artistic temperament, and had various special methods of arousing and restraining the revolutionary masses, including orchestral and vocal concerts of high excellence in the formerly royal theatres and the opera house of Munich. His policy followed extreme lines in the sense of furthering the Workmen's and Soldiers' Councils system, while at the same time he manifested a Bavarian particularism of his own in his efforts to maintain his conceptions of republican government in conjunction with the Councils in Bavaria as against the centralizing tendencies of the Berlin policy. It was with difficulty that he was induced to agree to the arrangements for reëstablishing the Federal system of the German Reich and for the election of a National Constituent Assembly. Meanwhile a Bavarian Assembly had been elected, and the Bavarian reactionaries feared that, when it assembled, Eisner's influence might continue to predominate or might even be fortified. He was, further, obnoxious to them on account of his revelations as to the origin of the war, and at an international Socialist conference at Berne he had urged the German delegates to make a clean breast of Germany's war guilt. He was on his way to open this Assembly, when he was shot dead in the street by a young Count Arco on Feb. 21 1919. This crime was speedily followed by the Bolshevist chaos into which Munich was for a brief period plunged in April.

Eisner was the author of various books and pamphlets, which display considerable literary faculty. They include *Psychopathia Spiritualis* (1892); *Eine Junkerrevolte* (1899); *Wilhelm Liebknecht* (1900); *Feste der Festlosen* (1903), and *Die Neue Zeit* (1919). (G. S.)

ELECTRICAL ENGINEERING (*see* 9.193).—In the articles on ELECTRICITY SUPPLY, ELECTROMETALLURGY AND ELECTROCHEMISTRY, TELEGRAPHY AND TELEPHONY, PYROMETRY, ELECTRIC LIGHTING, WIRELESS TELEGRAPHY AND TELEPHONY, various important applications of Electrical Engineering, as developed since 1910, are separately dealt with. This article deals with developments connected with the dynamo (*see* 8.764), and with progress as regards power stations and electric traction generally.

LARGE ELECTRIC SUPPLY STATIONS

Technical advances on the generation side of the electrical industry have been mainly in connexion with the wider use of the steam turbine on the one hand and with alternating-current transmission on the other. Thus the large turbo-alternator has become the standard machine for all important central stations dependent on steam. A further factor in this development has been the tendency towards the linking-up of supply stations in large areas in order to obtain increased economy—a matter which has so much importance for industry as to call for the appointment in Great Britain in 1919 of special Electricity Commissioners to deal with it. In other countries also the statutory regulation of electric supply has been seriously discussed and in Germany state control has been adopted.

Perhaps the most important feature which affects linking-up problems and standard lines of manufacture is the question of the system, or rather of the frequency, to be adopted. In the course of natural development, the 3-phase alternating current system at a frequency of 50 cycles per second has been more and more widely used until it can now be regarded as the standard throughout Europe. On the Continent, apart from traction work for which 50/3 or 15 cycles per second have been adopted, a few stations only still operate at 42 cycles per second. In Great Britain the chief exceptions are to be found in the use of 40 cycles in the N.E. coast area, and of 25 cycles in Birmingham and the Clyde valley, the 3-phase system being still retained. With 50 cycles as the standard the turbo speeds become fixed at 3,000 revolutions per minute (2-pole machines) and 1,500 revolutions per minute (4-pole machines). Units up to 20,000 kva. have been built at the former speed, and at the latter up to 40,000 kva. In the United States the standard frequencies are 60 and 25 cycles per second, the latter being essentially used for traction purposes. The higher frequency makes the construction of large 2-pole units more difficult, but nevertheless the successful development of high-speed machinery and of reduction gearing is having a marked influence towards the higher frequency. Even 60-cycle rotary converters for traction work are becoming common. Four-pole turbo-alternators running at 1,800 revolutions per minute to give a frequency of 60 have been built up to a capacity of 33,333 kva. Steam-turbine units of as much as 60,000 kw. are in use, but in this case the high-pressure and two low-pressure turbines each drive a separate 20,000 kw. generator at 1,500 revolutions per minute.

Thus the alternator has been able to keep pace with the demands of the steam turbine as regards large powers at high speeds with high thermal efficiencies for the combination. Even comparatively small units of 6,000 to 7,500 kw. have shown an efficiency from the thermal units of the coal to the net kilowatt-hour of 18 per cent. It is possible that the normal units of the future will be in the neighbourhood of 25,000 rather than of 50,000 kw. if an output of 100,000 to 150,000 kw. should come to be regarded as the maximum desirable for any one station.

A longitudinal section through a large 2-pole turbo-alternator of modern type is shown in fig. 1, wherein will be seen the channels provided for air to ventilate both rotor and stator. A fan is attached to each end of the rotor to blow air through the stator channels, and the heated air is discharged at the top of the outer casing.

The design of large turbo-alternators presents many difficult problems. The rotor (particularly at 3,000 revolutions per minute) is commonly of the cylindrical type made from a solid steel forging, the exciting winding being accommodated in slots and the coil ends secured by means of covers forged from special alloy steels. It is only by the most rigid construction that successful rotors can be made to withstand the enormous stresses set up at peripheral velocities in the neighbourhood of 25,000 ft. per minute. The adequate ventilation of such rotors is not easily obtained, and, while both air and water ducts are used, there is a strong tendency to dispense with ducts altogether and rely on non-combustible insulation (mica) for preventing injury from high temperature. The stator also needs especial care—not only is the cooling problem difficult, but the bracing of the coil ends has to be such that no movement of the conductors is possible even under conditions of sudden short circuit.

It has doubtless been due to the rapidly increasing demands for large powers and high speeds, and the success achieved therewith, that the frequency of 50 cycles has come to be more widely adopted

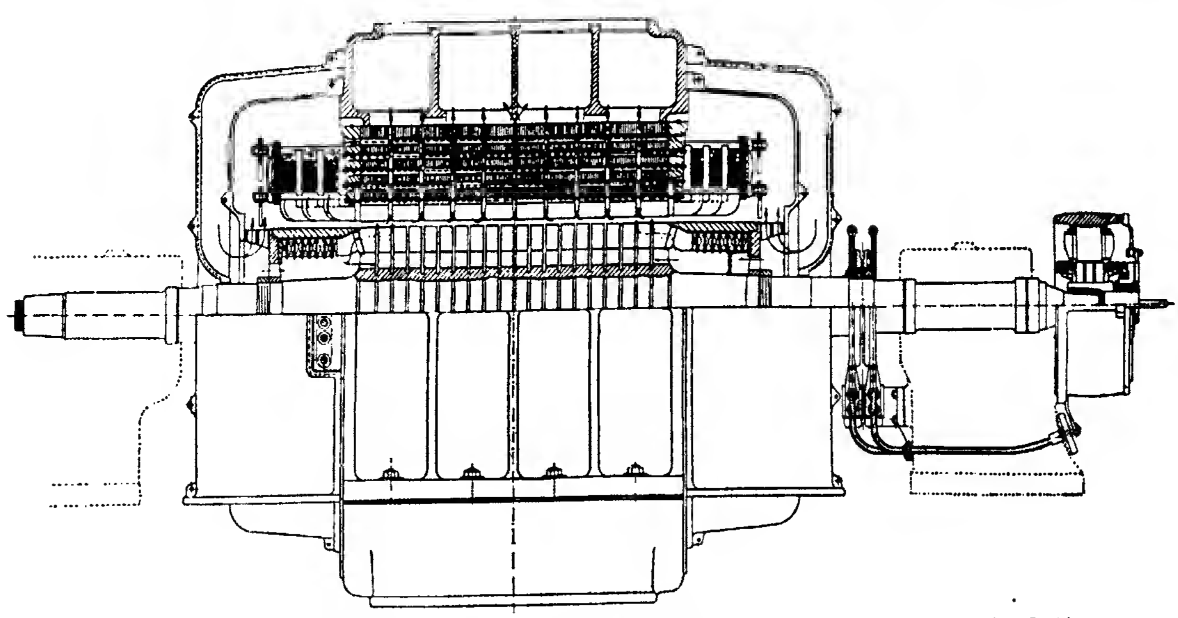

FIG. 1.—Longitudinal Section of Large 2-Pole Turbo-Alternator (Metropolitan-Vickers Electrical Co., Ltd.).

than the frequency of 25 cycles. Where the latter frequency has been retained it has been found preferable to use mechanical reduction gearing up to capacities of about 5,000 kw. Reduction gear may indeed be said to have revolutionized turbine driving for small outputs, the loss in the gearing being more than compensated by the increased efficiency of the high-speed steam turbine. It has further to be remarked that the application of reduction gearing to electrical work is still in its infancy. The greater expense of the geared drive is considered by many to be justifiable on account of its greater reliability and the higher efficiency of the plant.

The development of the continuous-current turbo-generator could not keep pace with the demand for increased output. Though satisfactory units up to 1,000 kw. were built, continuous-current turbo-generators are seldom built at the present day, except for installation on board ship. The demands of large users of continuous-current power, such as railways, chemical works, etc., are best met either by geared generators (steam turbines driving continuous-current generators through double helical reduction gearing) for moderate outputs, or by rotary converters for large outputs. Units of 2,000 to 5,000 kw. are not uncommon.

Both machines and transformers owe much of their development to the further utilization of the means for reducing the losses which occur in the iron and the copper. The use of silicon and other elements in alloy with steel in order to increase the resistance to the flow of eddy currents in iron is the factor which has been mainly responsible for the reduced weight per kva. of transformers, whilst the devices adopted for diminishing the unequal distribution of current in machines and transformers have rendered possible many modern designs.

As an instance of a modern power station may be cited that at Zschornewitz (Golpa), which at the present time (1921) is the largest steam-driven station in the world. This was erected in 1915 during the course of the war at the instance of the German Government for the supply of power for the production of nitrate of calcium in order to ensure a sufficient home supply of nitrates for agriculture and other necessary purposes. The engine-room contains 8 steam-turbine sets, each of 22,000 kva. capacity at 1,500 revolutions per minute, and the magnitude of the output may be judged from the daily consumption of about 7,000 tons of coal obtained from the lignite coal-field in the area of which the station is situated. There are 64 very large tubular boilers with 9 chimneys, each 328 ft. high, and 11 large cooling towers. Current is generated at 6,600 volts; of the total output 6,400 kw. are supplied at 6,000 volts to the nitrate works, while 33,000 kw. are supplied to Berlin, 95 m. distant, through a 100,000-volt double transmission line to a receiving station at Rummelsburg. The State is erecting at Friedrichsfelde a large distributing station for Berlin and adjoining districts, and at this station the combined outputs of the power stations at Lauta (40,000 kw.) and Spremberg (20,000 kw.) and from the Golpa transmission will be dealt with, while a third generating station in the Lausitzer lignite coal-field is in contemplation.

The lay-out of the plant in modern stations has been mainly governed by principles of economy. Larger boilers, higher steam pressures, greater superheat, the substitution of a small number of large turbine-driven sets for a large number of small slow-speed sets have all helped in this direction. The design and arrangement of the switch-gear have also been matters on which much care has been bestowed, particularly in countries where high transmission pressures up to 100,000 or even 150,000 volts have been adopted. In this connexion more efficient protection against lightning, pressure surges, short circuits, faults to earth, etc., may be particularly mentioned. The transformer is now built for such large powers and high pressures that, as with the switch-gear, separate housing is essential.

The cooling of the machinery and transformers calls for special consideration in the lay-out of large plants. Air is still the common cooling medium for machines, but the quantities needed by modern turbo-generators are so large that special intakes and outlets have to be provided. In addition, measures have to be taken for cleaning the air, particularly near towns or industrial centres. For this purpose dry filters were first tried, but were rapidly replaced by wet filters; that a completely satisfactory solution has not been attained thereby is evident from the experiments now being made to circulate the same air through the machine and a refrigerator. With transformers the case is somewhat different; oil is here the cooling medium, and air-blast transformers are now seldom called for. With natural oil-cooling no special provision has to be made, but in larger transformers usually the oil is water-cooled either by passing water through a cooling coil immersed in the upper part of the oil or by pumping the oil through a cooling chamber.

When continuous current is required it is often customary to generate 3-phase alternating current at the pressure required at the slip rings of the rotary converters, thereby dispensing with transformers. An important feature in connexion with modern switchgear is the mistake-proof devices for preventing wrong connexions or danger to the operators.

Railway Electrification

The valid reasons upon which the electrification of railways may be advocated have now become more clearly defined, and progress has been made as these reasons have shown themselves to be applicable to specific cases. Before the World War there was a pronounced desire in certain countries to make themselves economically independent, and therefore to utilize available water-power rather than to import coal, although it was not always easy to show that any appreciable saving would accrue from electrifying railways under these conditions. The countries chiefly concerned in this way were Italy, Switzerland and Sweden. A great impetus, however, was given to this movement during the war on account of the scarcity and high price of coal, and a stage has now been reached when it is safe to say that whatever the cost of coal may be in the future, certain railway lines will no longer be worked by imported coal. Another great factor has been the difficulty of dealing with increased traffic. The introduction of the electric locomotive—by increasing the average speed, especially on inclines, and by rendering heavier train loads feasible—has in several cases proved a cheaper solution than doubling or quadrupling the track. The tunnel and terminal advantages will also be recognized.

As an indication of the importance that the electrification of main lines has assumed, reference may be made to the fact that in many countries the question has been taken up by the states concerned. The outstanding feature of all the reports and discussions that have appeared has been the debatable question of the best system. As far as can be seen at present, different countries will ultimately decide in favour of different systems.

The three systems which call for discussion are:—

(*a*) The three-phase system;

(*b*) the single-phase system;

(*c*) the continuous-current system.

From a technical standpoint, all three systems may be said to be satisfactory. It will now be convenient to deal with the several countries separately.

Great Britain.—The general electrification of railways has been discussed, but has hardly received serious consideration. In 1920, a committee was appointed to advise the Ministry of Transport, and in its interim report advocated as the standard system the continuous-current system at 1,500 volts, the mode of generation of the power to be that prevailing in the district. Up to the present, practically the only lines that have been electrified have been city and suburban railways in and around London, Liverpool, Newcastle-upon-Tyne and Manchester. Until recently, the 600-volt continuous-current system, as used on tramways, was adopted for the railways, but with a third rail instead of an overhead conductor. There are now two exceptions—the Newport-Shilton mineral line 18 m. long at 1,500 volts with an overhead conductor, and the Manchester-Bury line 10 m. long with 1,200 volts and a third rail. There are only two examples of the single-phase system—the important electrification of the suburban system of the London, Brighton and South Coast railway, with an overhead conductor at 7,000 volts and a frequency of 25 cycles per second, and the small Morecambe-Heysham experimental line on the Midland railway. Extensions on the Brighton system were in progress before the World War, but these were not completed in 1921. With the exception of a few electric locomotives for hauling passenger coaches and goods trucks over the electrified sections, motor coaches are used entirely on the English electric railways. Amongst recent extensions of the 600-volt system in and around London may be mentioned the electrification of the suburban lines of the London and South-Western railway, the extension of the London and North-Western railway electrification to Watford, and the extension of the Central London railway on the Great Western railway from Shepherd's Bush to Ealing.

United States of America.—In the United States where so much has been done to develop both the continuous-current and the single-phase systems, many important electrifications have been carried out on both systems; but of late years, the leading firms, the General Electric Co. and the Westinghouse Co., appear to have favoured the continuous-current system. In America a break away from 600 volts was made long ago, and electrifications with 1,200 and 1,500 volts became quite common. Of recent years, the Butte-Anaconda mineral line was equipped on the continuous-current system at 2,400 volts, and served as an experiment for the electrification of the Chicago, Milwaukee and St. Paul railway at 3,000 volts. This line, over 655 m., was in 1921 the longest in existence, but conditions on this mountainous line through the Rockies differ considerably from conditions in densely populated areas. With the possibility of one train in about every two hours, it is hard to draw comparisons with the New York Central, the Pennsylvania and the New York, New Haven and Hartford lines.

The single-phase system has also been extensively applied in the United States, particularly on the Philadelphia section of the

Pennsylvania railway and on the Norfolk and Western lines, where the traffic is very heavy. There is a marked difference between the types of locomotives and of motors developed in America and those developed in other countries, and it is possible that the direction along which designers have gone in the United States has not on the whole been the most favourable for the single-phase system. At the same time it would be wrong to assume that America as a whole is in favour of the continuous-current system. The use of 16⅔ cycles in Europe as compared with 25 cycles in America has been much to the advantage of the former continent in single-phase work.

Italy.—Italy was one of the first countries in Europe to consider and adopt the electrification of its railways. At that time (1902) the three-phase system was practically the only one available for main lines, the position in this respect being somewhat akin to that on the Brighton railway when the single-phase system was chosen. The one serious drawback to the three-phase system is the need for two overhead wires at different potentials, which makes the overhead construction at points and crossings very complicated. Also the profile of certain tunnels renders the adoption of this system difficult. One undesirable result of the overhead complications is the limitation of the pressure to 3,000 volts. The objectionable double overhead potential and the choice of two other satisfactory systems have prevented the extension of the three-phase system to other countries. At the same time it should not be supposed that less success has been obtained with this system than with either of the others—indeed, the whole technical world must view with admiration the ability shown by the Italian engineers in carrying out the system. Many important State lines are now worked electrically, among which may be mentioned the pioneer Valtellina line (opened in 1902), the Giovi tunnel and the Mont Cenis tunnel lines. For mountain lines the three-phase system is peculiarly well adapted, because of the automatic regenerative braking action which occurs as soon as the motors run above synchronous speed. The original locomotives had two speeds obtained by the cascade arrangement of two motors; while the newer locomotives have four speeds, the cascade connexion being combined with pole-changing devices. The power for the Italian lines is obtained from hydraulic stations, the use of water-power being important in a country without native coal.

Switzerland.—To Switzerland belongs the credit of much pioneer work in railway electrification ever since the Oerlikon Co. equipped an experimental line from Seebach to Wettingen. The piercing of the Simplon tunnel in 1907 was followed by the adoption of the three-phase system so as to utilize available plant as far as possible. This tunnel is 14 m. long (from Brigue in Switzerland to Iselle in Italy), and insulation difficulties were experienced with both overhead conductors and locomotives on account of the hot springs, which produced a very humid, warm atmosphere. On a cold day, a locomotive entering the tunnel from Brigue became rapidly covered with moisture. The earlier locomotives were provided with slip-ring induction motors, two speeds being obtained by changing the number of poles; the later locomotives have squirrel-cage rotors and are arranged for four speeds, the stators being provided with two-pole changing windings. The three-phase electrification has now been extended to Sion in the Rhone valley. In 1912 the Loetschberg railway from Berne to Brigue (Simplon tunnel) was opened and from the outset this line was operated electrically. The system chosen was the single-phase system at 15,000 volts and 15 cycles. (This may be changed later to 16⅔ cycles, the frequency used on the Federal railways.) After the initial difficulties had been overcome, both in the overhead system and in the locomotives, the Swiss Government decided to apply the same system on the St. Gothard railway. In this connexion mention may be made of the important official commission which was appointed in 1904 to study the electrification of the Swiss railways. Several reports were issued by this commission, the labours of which were concluded in 1914. It has been claimed that the economy and efficiency of the single-phase system are greater than those of other systems, and this was particularly the case on the Loetschberg railway, where the single-phase overhead line is fed directly from the single-phase generating station at Spiez at the working voltage without transformers. Not only did the commission report strongly in favour of the single-phase system, but also advocated the generation of single-phase power at railway frequency (16⅔ cycles) rather than 3-phase generation at the industrial frequency of 50 cycles and conversion to single-phase at railway frequency. If the over-all cost of energy delivered to the locomotive, including attendance, be reckoned as unity when the current is converted from one system to another, this may be reduced to about 0·6 when conversion is dispensed with, and the latter figure can again be reduced still further when the intermediate link of transformers is eliminated. Extensions have been made on the lines adjoining the Loetschberg line as far as Berne, and the St. Gothard line (Lucerne–Chiasso) is now working electrically from Erstfeld to Bellinzona. Several of the lines subsidized by the Canton of Berne have recently been electrified and linked up with the Loetschberg railway, while many other important projects are also under consideration. It is estimated that about 30 per cent of the Swiss railways are now worked electrically.

Doubtless one of the chief causes of the success of the single-phase system in Switzerland arises from the successful development of the single-phase commutator motor for traction work. In Europe there has always been a tendency to use fewer and larger motors and to mount them higher in the locomotive than is the case in America. Though this construction has introduced new problems with connecting and coupling rods, it has permitted the logical development of the single-phase motor. Of all the different types of commutator motor—the repulsion motor with fixed and movable brushes (Déri motor), the repulsion motor with phase compensation (Winter Eichberg Latour motor as used on the London, Brighton and South Coast railway), and the various forms of series repulsion motor—the successful survivor is doubtless the compensated series motor, the excitation required to give the E.M.F. to neutralize the transformer E.M.F. in the coils short-circuited by the brushes being obtained by suitable winding on auxiliary poles. Though such motors can be built for low terminal pressures only (200 to 500 volts) and therefore necessitate step-down transformers on the locomotive, advantage is taken of this to obtain economical and ample speed control by providing suitable tappings on the secondary of the transformer.

Germany.—In Germany the single-phase system has also been adopted where main lines have been electrified. The chief electrified lines are the Dessau–Bitterfeld section of the Magdeburg Hall line, the Silesian mountain lines and the Wiesental railway in Baden. Early in the present century trials had been made on the Berlin–Zossen experimental line, and it would appear that the single-phase system at 15,000 volts, 16⅔ cycles, will be adopted as the standard system for the German railways. The power for several of these lines is generated at 60,000 to 80,000 volts in steam stations. The electrification of the Dessau–Bitterfeld line was the alternative chosen in preference to quadrupling the tracks in order to cope with the increasingly heavy demands on this section.

Many different types of electric locomotive have been built in Germany, some of which were in accordance with the specifications of the railway engineers. Much adverse criticism was raised owing to important troubles in several constructions, arising mainly from failures in the driving mechanism. Many problems, both in Germany and Switzerland, concerning vibrations set up by the natural frequency of the system, deformation of the several parts and the play in the bearings, had to be investigated before successful solutions were found. In some cases it was found that an elastic member between the driving and the driven parts proved effective in damping the oscillations.

Sweden, like Italy and Switzerland, is a country without coal but with ample water-power. The first important electrification in Sweden was the Riksgräns railway, the most northerly railway in the world, situated entirely within the Arctic Circle. This railway extends from Luleå in the Bothnian Gulf to Narvik, an ice-free port on the Norwegian coast, and is used for transporting mineral ores to the latter place for export. Since the original electrification was carried out in 1910 extensions have been made, and it is hoped that the whole line will shortly be worked electrically.

The high price and great scarcity of coal towards the end of the war, and afterwards, made the consideration of the utilization of water-power extremely urgent. The expert commission appointed to study the question confined its attention to the problem of immediate urgency—the Stockholm–Gothenburg line. A careful comparison was made between the continuous-current system at 3,000 volts and the single-phase system at 15,000 volts, and it was shown that the latter was slightly better from an economic standpoint, in addition to which the Swedish railway administration and manufacturing firms were fairly well acquainted with the actual working of the single-phase system. The proposals for this scheme were accepted by the Riksdag in 1920.

France.—A commission was also set up in this country to study the electrification of the French railways. Before the war certain short sections had been electrified on the single-phase system, but as a result of a post-war visit to the United States, the commission appeared to be whole-heartedly in favour of the continuous-current system, at a pressure of 1,500 volts—in this respect agreeing with the findings of the British advisory committee. It is intended to make use of the waterfalls for supplying energy to the railways.

Austria.—Prior to the war, the Mittenwald railway between Austria and Bavaria had been electrified, and it has now been decided to adopt electrification on a general scale. The system adopted is the single-phase at 15,000 volts and 16⅔ cycles. Locomotives were ordered in 1920, and it was hoped to commence running in 1925.

General.—As general problems connected with electric traction on railways may be mentioned interference with communication circuits, regenerative braking and speed control.

In most countries telegraph and telephone lines run alongside the track, and all systems have created disturbances in these circuits from electromagnetic or electrostatic influence. Some of these disturbances are periodic and traceable to harmonics in the current in the power circuit; others, perhaps the most violent, arise from pressure surges, earths, short circuits, etc. Numerous remedies have been adopted, most of which are more or less costly. Thus the avoidance of close parallels by removing the communication circuits to a distance or placing them in underground cables is an expensive expedient. To say, as is usual, that the single-phase system causes worse disturbances than the continuous-current system could not be accepted as a general statement; some of the most troublesome cases have occurred in continuous-current systems fed from rotary

converters. However, the causes are now better understood and successful remedies are in sight. It may be mentioned that, while the French commission in their decision in favour of the continuous-current system were largely influenced by the interference question, the Swedish commission regarded it as no better in this respect than the alternating-current single-phase system.

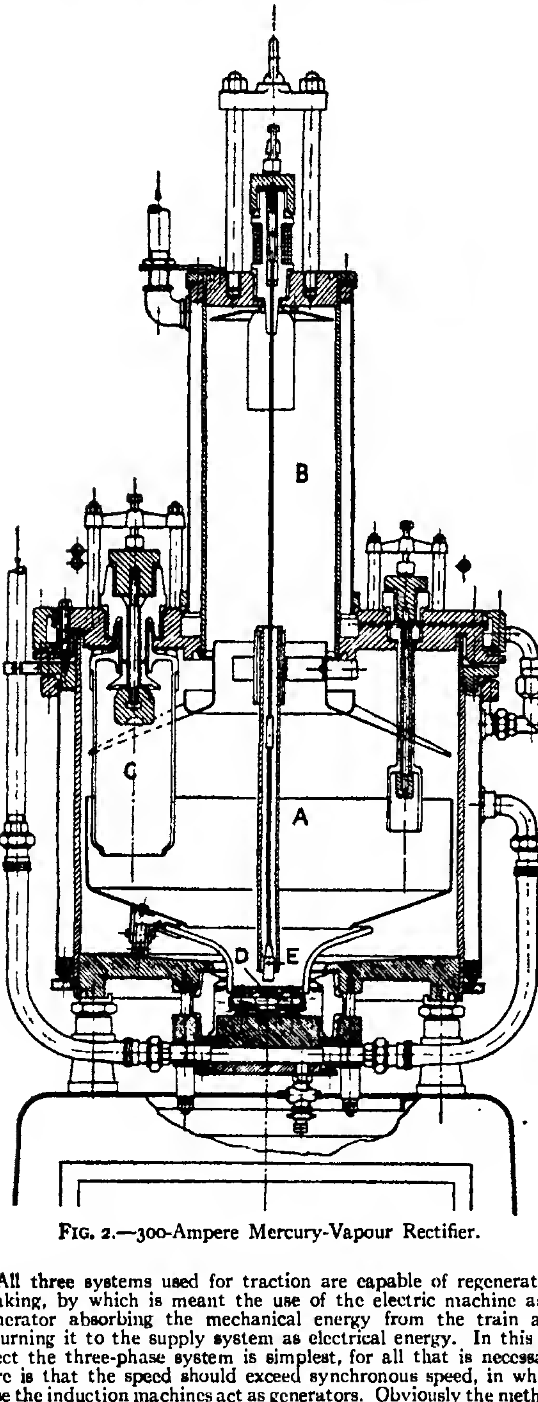

FIG. 2.—300-Ampere Mercury-Vapour Rectifier.

All three systems used for traction are capable of regenerative braking, by which is meant the use of the electric machine as a generator absorbing the mechanical energy from the train and returning it to the supply system as electrical energy. In this respect the three-phase system is simplest, for all that is necessary here is that the speed should exceed synchronous speed, in which case the induction machines act as generators. Obviously the method is not suited for bringing trains to rest. With the other two systems special devices are requisite, and though regenerative braking was first developed for continuous-current traction, successful solutions have now been developed and applied on single-phase locomotives in Switzerland, which enable the train to be brought to rest by regenerative braking. Hitherto, in the matter of regenerative braking, economy in power has usually been of less importance than the saving in wear and tear of tires, brake blocks and rails. On the lines where such braking is applied, it is frequently impossible to utilize the returned energy, which is accordingly consumed in resistance.

Speed control can be obtained with all systems. With a continuous-current supply series, parallel connexion and field weakening together provide a limited number of economical running speeds. It must be borne in mind, however, that weakening the field reduces one of the torque-producing factors, which may entail serious increase in armature heating when the torque rises rapidly with the speed. With three-phase supply two or four speeds are obtained by cascade connexion or pole-changing devices. The single-phase system, by means of a variable-ratio transformer, provides most easily a large number of economical speeds.

Large mercury-vapour rectifiers have recently been constructed and put into commercial use; these entail further auxiliary apparatus as vacuum and water pumps, and their relative advantage or disadvantage as an alternative to the rotary converter for traction work remains to be decided in the future. Fig. 2 shows a small 300-ampere rectifier as made by Messrs. Power Rectifiers, Ltd., which can supply the rectified current at any voltage up to 750 volts. The arc operates in the lower chamber A, between the mercury cathode D and anodes C, of which there are usually six connected to the six-phase secondary of a transformer. The neutral point of the secondary is brought out and forms the negative pole of the continuous-current system, the cathode being the positive pole of that system. The arc is struck by means of the ignition anode E, which is connected by a long rod with the solenoid mounted on the top of the condensing chamber B. This solenoid is controlled by a push-button ignition switch, and the connexions are so arranged that when the anode E touches the mercury a portion of the current which was previously flowing through the solenoid coil is diverted; this allows a spring acting in opposition to the solenoid to raise again the ignition anode. The rectifier is cooled by water circulated through the base of the cathode, through a jacket round the arc chamber, and thence through the plate in which the anodes are mounted and the jacket round the condensing chamber. Larger sizes dealing with 600 and 1,000 amperes are manufactured, and for larger outputs two or more rectifier cylinders are placed in parallel and connected to a single transformer.

HYDRAULIC ELECTRIC STATIONS

Probably in no direction has greater progress been made of recent years than in the utilization of water-power. In all civilized countries throughout the world plants have been installed and projects drawn up for utilizing this natural source of energy. An idea of what is possible and of what has been done in this direction is obtained from the following approximate table, taken from a paper by E. M. Bergstrom (*Inst. Mech. Eng.* 1920):—

	B.H.P.		
Country	*Available*	*Developed*	*Per Cent*
U.S.A.	28,100,000	7,000,000	24·9
Canada A	18,803,000	1,735,000	9·2
" B	8,094,000	1,725,000	21·3
Austria-Hungary	6,460,000	566,000	8·8
France	5,587,000	1,100,000	11·6
Norway	5,500,000	1,120,000	20·4
Spain	5,000,000	440,000	8·8
Sweden	4,500,000	704,000	15·6
Italy	4,000,000	976,000	24·4
Switzerland	2,000,000	511,000	25·5
Germany	1,425,000	618,100	43·4
Great Britain	963,000	80,000	8·3

Low, medium and high falls, ranging from 4 ft. (*e.g.* on the river Main) to 2,700 ft. of head (*e.g.* at Luchon on the French Pyrenees) have all been brought into service. To take one instance only, the modern water-power station on the river Dal, about 80 m. from Stockholm, contains four turbines, each of 10,000 H.P. coupled directly to dynamos at 125 revolutions per minute, and larger sets up to 20,000 H.P. are not uncommon. The latest (1920) station of the Southern Power Co., operating in S. Carolina, U.S.A., has been installed on the Wateree river for 90,000 H.P. and contains five turbines, directly coupled to generators each of 14,000 kva. The extension of station No. 3 of the Niagara Falls Power Co., developing an additional 100,000 H.P. at Niagara, is noteworthy for the inclusion of 32,500 kva. 12,000-volt three-phase alternators running at 150 revolutions per minute and a frequency of 25 cycles per second. One of these, manufactured by the Allis Chalmers Mfg. Co., is shown in fig. 3.

For high falls Pelton wheels are employed, and in the case of Luchon, quoted above, each Pelton wheel develops 6,200 H.P. at the high speed of 1,500 revolutions per minute. Still higher heads are being utilized, and owing to the high costs of material and

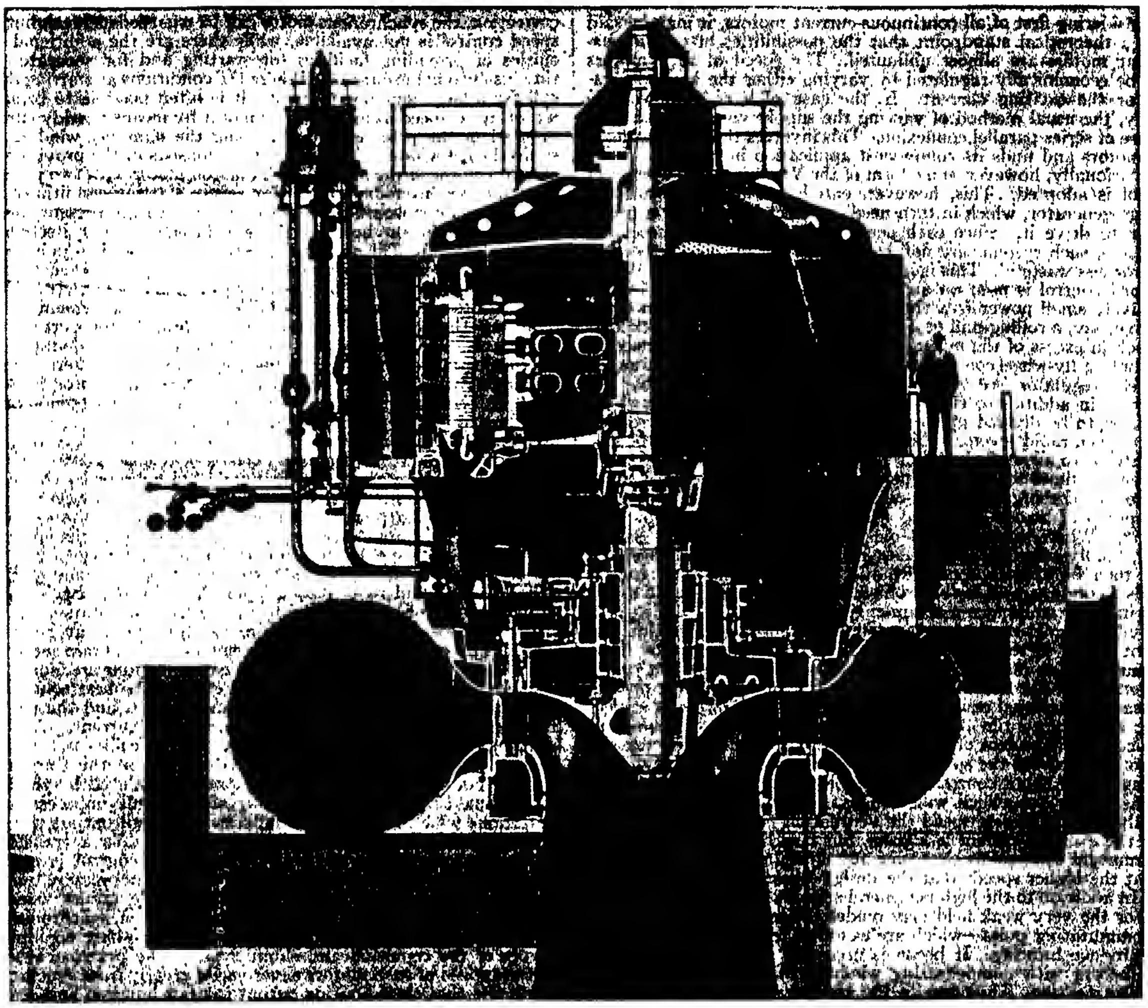

FIG. 3.—32,500-kva. Combined Water-Turbine and Alternator.

labour, the tendency is to favour the development of high-head falls which require less civil engineering owing to their smaller volumes of water. The chief problem in the design of water-wheel alternators is in the construction of the rotor. Owing to the possibility of racing, water-turbine-driven sets have to be capable of withstanding overspeeds of 80 to 100%. In many cases the peripheral speed is high on account of the large output, while large diameters become necessary to meet the demands for fly-wheel effect. The result is that a very rigid construction is necessary for the rotor, usually embodying some modification of the dovetail for securing the poles and field windings. The stator windings also, as in turbo-alternator, have to be securely braced in order to withstand the severe conditions of sudden short circuit. It is customary to make water-wheel alternators totally enclosed to reduce windage losses, to assist artificial ventilation and to protect the machine against possible leaks from the turbine.

Small hydro-electric stations are now in action which are either entirely automatic and actuated by a change of water level, or set in operation by remote control in accordance with the demands for power from the network. A case of interest as involving the export of energy is the hydro-electric transmission of power up to 20,000 H.P. from the power-station of Gösgen on the river Aar in Switzerland to a distributing station situated in France, where the supply is placed in parallel with the steam-driven station of Vincy. Transmissions from Norwegian waterfalls to Denmark and Sweden are also contemplated.

One reason for the comparatively small amount of power utilized in Great Britain has been the abundance of coal. In many cases the development of water-power has only become possible since coal became dear and scarce, for it must not be forgotten that hydraulic installations are frequently very costly on account of the civil engineering works that have to be constructed in places difficult of access, and of the long high-tension transmission lines.

In many countries water-power is now being developed in accordance with definite policies. Thus in Switzerland, where the linking-up of stations has been adopted on a wide scale, the low-head power stations in the valleys, which utilize river energy, are designed to supply the mean power and therefore to run on practically constant load, while the "peak" loads are supplied by the high-head stations in the hills, which are fed from natural lakes or reservoirs in which the water is impounded by means of dams.

In Italy power is available from the Alps in summer from the melting of ice and snow, and from the Apennines in winter from rain. By linking up the several stations a continuous supply of energy is assured. In Germany the canalization of rivers is carried out hand-in-hand with the supply of electric energy by building power-stations at the weirs.

Wave-power, tidal rise and fall, and tidal currents in estuaries have all received attention, especially in France, as possible sources of power in the future, and a large scheme for utilization of the water-power available from the Severn has been proposed, but in no case have the projects advanced beyond the stage of discussion.

APPLICATIONS OF ELECTRIC MOTORS

One of the main factors in the development of electrical supply has been the extended use of electric motors for driving machinery of all kinds. In addition to the numerous class of simple, straightforward drives, the electric motor has been applied with success under more difficult conditions, demanding large starting torque, considerable powers and wide variations of speed. Along with this development has been the extension of the three-phase system, in consequence of which there has arisen a wide demand for variable-speed, alternating-current motors. Some directions of their application may be dealt with.

Considering first of all continuous-current motors, it may be said from a theoretical standpoint that the possibilities of continuous-current motors are almost unlimited. The speed of such motors may be economically regulated by varying either the applied pressure or the exciting current. In the case of a constant-voltage supply, the usual method of varying the supply voltage consists in the use of series-parallel connexion. This involves the use of at least two motors and finds its commonest application in traction.

Occasionally, however, some form of the Ward-Leonard system of control is adopted. This, however, entails the use of a variable-voltage generator, which in turn needs an electric motor or a prime mover to drive it. Since each conversion of energy is associated with loss, such systems are not only costly but eventually become more or less wasteful. This is particularly the case when the Ward-Leonard control is used on an alternating-current system of comparatively small power (*e.g.* that of a private installation) in order to drive, say, a rolling-mill or a winding-engine where the peak load is much in excess of the mean load. Here it often becomes needful to supply a fly-wheel converter set consisting of an induction motor with slip regulator (see below), a variable-voltage generator and a fly-wheel, in addition to the driving motor, the armature of which has often to be divided into two or three parts in order to reduce inertia when rapid reversals are necessary. The function of the slip regulator is to allow the speed of the induction motor to fall when a heavy load comes on, and so to permit the excess load to be taken up by the stored energy in the fly-wheel. Such sets often have to deal with peaks of 20,000 H.P. and may give an overall efficiency of 50-70%. Where the supply systems are sufficiently large, as on the Rand, the fly-wheel can be dispensed with, but the induction motor must then be able to cope with the peaks. The electric winder affords a good example of the problems that have to be met in many cases in order to replace a steam-engine drive.

A much simpler method of controlling the speed of a continuous-current motor is to vary the exciting current. This can be done automatically or manually, and it may be made dependent on or independent of the load; but in every case a single machine only is necessary. The usual continuous-current motor for different speeds is the shunt motor; in this, with a given excitation, the speed is practically independent of the load; but by increasing or decreasing the exciting current the speed is lowered or raised respectively. By this method of shunt control it is possible to obtain speed ranges as high as 1·5 or 1·6. Such wide ranges, however, make the design difficult. At the lowest speed the ventilation is usually very poor, while the exciting current is highest, but fans built on the shaft of the armature can usually overcome any difficulty arising therefrom. It is at the higher speeds that the design becomes a serious problem. In addition to the high peripheral speeds of armature and commutator the very weak field may render the motor unstable, while the commutating poles—which are essential to prevent sparking—may produce hunting. It becomes necessary therefore to provide such motors with compensating windings in order to neutralize armature reaction. Thus despite the economy of this method, the motors become costly when wide speed ranges are demanded.

Series motors in which the exciting winding is in series with the armature winding, and in which in consequence the speed becomes a function of the load, are widely used for drives where there is no danger of the load being removed—*e.g.* for traction or for fans, cranes, etc., but the only common application of voltage and field control of series motors is for traction work.

The compound-wound motor combines the shunt and series characteristics in varying degree, according to requirements. If a series characteristic is required with merely a limiting top speed, it is only necessary to provide the motor with a small shunt winding in addition to the series winding in order to prevent racing. When, however, an increased torque at starting or a fall in speed in the case of overloads is demanded, a small series winding is added to the shunt winding. In the former case the series turns may be short-circuited if desired after a definite speed has been reached.

Except in cases where a variable voltage is applied to the motor, starting resistances are necessary with continuous-current motors, so that continual starting becomes wasteful. For general speed control the continuous-current motor is doubtless unrivalled, and where circumstances justify the outlay conversion from alternating to continuous current is the best solution. A typical case would be a factory in which several variable-speed motors are installed.

Coming to the alternating-current side, mention must first be made of the question of power-factor rectification. The alternating-current, three-phase system having established itself as the standard method of transmission, vigorous attempts are being made in every country to keep the power-factor of such systems as high as possible, in order to secure the minimum outlay in transmission and generation. Obviously, with three-phase supply it becomes highly important to employ wherever practicable three-phase motors, but in any such application the power-factor must not be overlooked. Broadly speaking, the user does not stand to gain by ignoring this question, for whether the rectification is achieved by him or by the power company, or is not done at all, the consumer has to pay.

Though with alternating current there are more types of motors available than with continuous current, speed control presents a more difficult problem. From the point of view of power-factor correction, the synchronous motor can be regarded as ideal, but here speed control is not available, while there are the additional difficulties of providing facilities for starting and for separate (continuous-current) excitation. Where the conditions at starting do not call for a large amount of torque, it is often possible to bring the motor up to speed as an induction motor by means of eddy currents induced in the pole shoes or by using the damping winding as a squirrel-cage winding. The next stage consists in the provision of a starting motor in the form of an induction motor with two poles less than the synchronous motor. For severe starting conditions, such a starting motor would become too costly, and the present solution is being sought by building the synchronous motor itself as an induction motor. The machine then runs up to speed as an induction motor, is excited by continuous current and pulls into synchronism, whence it continues running as a synchronous motor. In addition to meeting severe starting conditions, this arrangement is also replacing the induction motor where power-factor correction is important. By its simplicity the induction motor is doubtless the alternating-current motor that finds most favour. Where repeated starting or where speed control is necessary the motor is uneconomical, because the input to an induction motor depends on the torque, and is independent of the speed. Nevertheless it is often preferable to incur this waste rather than to install converting sets. It is possible, however, to obtain economical speed control with an induction motor by changing the number of poles or by connecting two induction motors in cascade—in each case, however, with a certain sacrifice in power-factor as well as through the extra cost incurred. There are numerous ways of effecting a change in the number of poles—*e.g.* by regrouping the coils, by varying the number of phases, by using two or more windings, etc.—and generally it becomes needful to employ a squirrel-cage rotor. Such a rotor, however, does not necessarily mean a low starting torque, for some of the locomotives used on the Simplon tunnel railway have such windings. Generally speaking, it is not usual to obtain more than six speeds with induction motors, while two and four are more usual.

The commutator motor offers theoretically the best solution for obtaining speed control with alternating current, and the possibilities here are the same as with continuous current. Actually, however, the limitations are more severe, because not only do commutation conditions limit the pressure as in the continuous-current motor, but the transformer pressure induced by the alternating flux in the coils undergoing short-circuit imposes further limitations which result in a comparatively small output per pole. The reduced commutator pressure usually entails a transformer between supply and motor, but where speed control is required advantage can be taken of this to vary the applied pressure by using a variable-ratio transformer. The real trouble occurs when the E.M.F. in the short-circuited coils depends upon synchronism, as in three-phase commutator motors and single-phase commutator motors of the repulsion and shunt types. The practical result is that the speed of such motors never varies greatly from synchronous speed, and that their limiting output is a few hundred horse-power. On the other hand, types like the single-phase series commutator motor, free from this restriction, have been successfully built for outputs of over 1,000 H.P. and speed ranges up to four or five times that of synchronism. Despite limitations, alternating-current commutator motors are becoming more widely used, particularly for small outputs; while as cascade or auxiliary motors they have been successfully applied for utilizing the slip energy of large induction motors. Variable-speed sets of this kind will probably be more widely developed in the future, particularly when the properties of alternating-current commutator motors come to be better understood.

ELECTRICITY SUPPLY (*see* 9.198).—UNITED KINGDOM.—In its commercial aspects the history of electricity supply in the United Kingdom from 1910 to 1914 was comparatively uneventful. No fresh legislation was passed; no new supply schemes of the first magnitude were brought forward. The supply undertakings were in the main content with steady development among both industrial and domestic consumers. Advances were more rapid in the lighting field on account of the appearance of the drawn-wire tungsten lamp, first in the vacuum type and later in the gas-filled type. Improvements in cooking and heating apparatus also stimulated the domestic day load. The war, however, arrested the growth of the domestic demand and brought an urgent and practically unlimited call for electric power in factories and workshops extended for war purposes and in new factories erected for the production of munitions of war. During the first months of war the need was met by running all the plant (including reserves) available in public generat-

ing stations to its full capacity. The margin of power thus pressed into service was of great value in accelerating the output of munitions, and when the Ministry of Munitions was formed—in the spring of 1915—no special department to organize the supply of electric power was thought necessary. Within a few months evidence of the vital importance of electricity for almost every war demand had become so strong that a department was formed to deal with all electrical engineering questions. All proposals for the extension of generating stations and mains had to be brought before the Electric Power Supply Department of the Ministry, which issued priority certificates for those judged to be most urgent. The output of electrical manufacturing firms was likewise controlled, so that the production of both electric power and electric plant was centrally organized to meet the ever-increasing demand for current.

Between June 1914 and Oct. 31 1918 the plant capacity of 327 municipal undertakings rose from 705,000 kilowatts (K.W.) installed to 1,490,000 K.W. installed or on order, and of 230 company-owned power stations from 430,000 K.W. installed to 788,000 K.W. installed or on order. Thus the additional generating plant installed or on order during the war aggregated 1,143,000 K.W., and was almost exactly equal to the total plant capacity existing at the outbreak of war. Further, considerable orders were placed for private electric generating plants, particularly in connexion with the extension of iron and steel works, where waste heat was available. All of the additional power was required for power, smelting, and other industrial purposes. New connexions for domestic purposes were not made, and owing to military requirements, coal shortage, and other causes restrictions were placed on public and private lighting and on the general domestic consumption of electricity. Exact statistics of total domestic demand are not available, but in this direction there was a substantial diminution in output during the war.

The capital cost of these extensions, including mains and substations, was about £23,000,000. They were financed, where necessary, by Treasury issues of interest-bearing loans, repayable by annual instalments over 15 years or so. Further, the Ministry of Munitions was empowered to guarantee to bear the difference between the cost of carrying out extensions during the war and the estimated cost of the same work if carried out at a period, generally one or two years, after the period of hostilities, and also to meet the cost of any portions of extensions found to be in excess of the post-war needs of the undertaking. The object of this arrangement was to put the undertakings in the position they would have occupied if they had not extended during the war, but had waited until their post-war requirements had to be met. About £3,150,000 out of the total of £23,000,000 was thus advanced by the Ministry of Munitions. Some applicants pressed for definite Government grants, but these were refused on the ground that electric supply undertakings enjoyed a monopoly with perpetual or lengthy powers for the supply of a commodity required after the war, and were therefore in a different position from manufacturers called upon to undertake a form of production not needed under peace conditions.

The general policy of the British Government was to encourage power users to take current from the public mains rather than to erect separate small generating stations. Even where private plants were sanctioned, as in the special cases mentioned above, linking-up with an adjacent public service undertaking was arranged wherever possible. Public supply undertakings were also in some cases linked together for mutual assistance.

During the war there was a marked increase in the average size of generating units, an improvement in load factor, and a reduction in the costs of generation. Before the war the average size of generating unit installed was 522 K.W., with 8,000 K.W. as the capacity of the largest unit. At the end of Oct. 1918 the average size was 7,044 K.W., and units of 25,000 K.W. and 30,000 K.W. were being built. In 1914 the coal consumption per unit sold was 4·1 lb.; in 1918 it fell to 3·75 lb. in spite of the very inferior fuel then in use—an improvement due to the larger and more efficient plant and the rise in load factor resulting from concentration of load.

Two special control orders were imposed on the industry by the Ministry of Munitions. The first—Converter Plant Control Order, 1918 (issued April 5 1918 and cancelled Feb. 28 1919)—was designed to reduce the demand for converter plant and to assist supply engineers in persuading customers (especially shipbuilding firms) that the alternating current available was quite suitable for their requirements. The second was the Electricity (Restriction of New Supply) Order, 1918, issued on Nov. 8. A shortage of coal had arisen in the early part of that year owing to large withdrawals of miners for active service, and from other causes; and the coal controller accordingly rationed the use of coal. As the Ministry of Munitions undertook to limit new electrical connexions to consumers wholly engaged on urgent munitions work the rationing was not applied to power stations. Concurrently with the issue of this order the coal controller rationed the use of both electricity and gas for domestic purposes. On Jan. 10 1919 the order was revoked.

In spite of the enormous increase in output, which made the four years of war equivalent in electrical growth to the previous 32 years of industry, the financial condition of the undertakings did not on the whole improve. Very few undertakings paid excess profits, and most of them had to raise their prices substantially in order to keep receipts above the rising tide of costs, due to increases in wages and the higher cost of coal, stores and repairs. The position of the smaller provincial undertakings, which had practically no industrial load, became especially difficult. Maximum prices are scheduled in every provisional order, and in many cases they proved too low in the abnormal circumstances created by the war. The Statutory Undertakings (Temporary Increase of Charges) Act, 1918, was passed to afford relief. The Board of Trade was empowered, after inquiry into applications for relief, to permit increases in maximum charges sufficient, in the case of companies, to enable three-quarters of the pre-war dividend to be paid, and, in the case of municipalities, to not more than 50% above the pre-war charges, or more than sufficient to enable the undertaking to be carried on without loss.

Committees on Electricity Supply.—The proof afforded early in the war of the great national importance of electricity supply led to a series of official investigations into the question of reorganizing the industry on broader and more efficient lines. The Reconstruction Committee (later the Ministry of Reconstruction) formed a Coal Conservation Sub-Committee which discussed the subject chiefly from the standpoint of the more economical use of fuel. The supply industry was also touched upon by the committee formed by the Board of Trade to consider the position of the electrical trades after the war. As the result of a recommendation by this committee a Departmental Committee of the Board of Trade on electric power supply was formed. A report on the same subject was prepared by the Committee of Chairmen of the Advisory Council of the Ministry of Reconstruction. These reports, particularly that of the Board of Trade Committee on electric power supply, led up to the appearance before the House of Commons in the 1919 session of the Electricity (Supply) bill. In its original form the bill provided for the appointment of electricity commissioners and for the constitution of district electricity boards to secure a cheap and abundant supply of electricity by: (*a*) the acquisition of generating stations, (*b*) the acquisition or use of main transmission lines of any authorized undertakers, (*c*) the supply of electricity within their district (including the construction of generating stations, main transmission lines, and other works required for the purpose), and (*d*) the acquisition of the undertakings or parts of the undertakings of authorized distributors and power companies. At dates to be specified all the public generating stations and main transmission lines in a district were to vest in the board subject to the payment of the "standard price." In the case of municipal undertakings the standard price was defined as one or more annuities sufficient to indemnify the local authority against their liabilities for interest and sinking fund. In the case of a company it was to be "the cost of and incidental to the construction of the generating station or main transmission line, and the acquisition of the site thereby, less depreciation." Boards were to be empowered to borrow for these purposes on terms to be fixed by the electricity commissioners, who were also to be empowered to lend to boards or authorized undertakers, subject to Treasury approval, money up to a total of £25,000,000, if they were satisfied that the boards or undertakers could not otherwise raise the money on reasonable terms. A sum of £20,000,000 was also to be made available out of the consolidated fund to enable the Board of Trade to construct interim works during the first two years.

Opposition to the bill was directed chiefly against the compulsory character and operation of joint electricity control, the magnitude

of the sums of public money involved and the inadequacy of the "standard price" in the case of supply companies. In order to meet the first point clauses were introduced by the House of Commons to enable joint electricity authorities to be constituted on a voluntary basis to undertake duties similar in the main to those of district electricity boards. The formation of a *board* with compulsory powers was retained as an alternative to an *authority* where voluntary action failed to carry out the intention of the Act.

As the bill did not reach the House of Lords until shortly before the end of the parliamentary session, the contentious parts of the bill were withdrawn by the Government.

Electricity (Supply) Act, 1919.—The Electricity (Supply) Act, 1919, was therefore essentially a voluntary measure. It provided for the appointment by the Board of Trade of not more than five electricity commissioners, three of whom were to be selected for practical, commercial, and scientific knowledge and wide business experience, including that of electrical supply. The five commissioners appointed were Sir John Snell (chairman), Mr. W. W. Lackie (formerly chief engineer and manager of the Glasgow Corp. electricity department), Mr. A. Page (formerly general manager of the Clyde Valley Electrical Power Co.); Sir Harry Haward (formerly comptroller of the L.C.C.), and Mr. H. Booth, of the Board of Trade. Their general duties are defined in the Act as "promoting, regulating, and supervising the supply of electricity"; and they are empowered to conduct experiments for the improvement of electricity supply or the utilization of fuel or water-power, and to appoint committees to advise them on matters connected with the general improvement and development of the supply of electricity. Their first specific duty was to determine provisionally "electricity districts" for the purposes of the Act and to hold a local inquiry in each suggested area to determine the area finally, and to hear and consider schemes for improving the existing organizations for the supply of electricity. Such schemes might provide for the establishment and incorporation of a district electricity authority representing authorized undertakers in the district, county councils, local authorities, large consumers of electricity, and other interests within the district, and for the exercise by that authority of the powers of the authorized undertakers, and for the transfer to it of any of the undertakings by consent and on terms provided by the scheme. Effect is given to a scheme by its embodiment in an order presented to the Board of Trade for confirmation and, when confirmed with or without modification, laid before Parliament for approval, whereafter it has the effect of an Act.

The duty of a joint electricity authority is to "provide or secure a cheap and abundant supply of electricity within its district," and for that purpose it shall have such powers as may be embodied in the scheme as regards: (*a*) the supply of electricity within the district (including the construction of generating stations, main transmission lines, and other works), and (*b*) the acquisition of supply undertakings. No generating station or main transmission line can be established or extended without the consent of the electricity commissioners, except in the case of a private station, which must comply with regulations as to the type of current, frequency, and pressure laid down by the commissioners. Each joint authority is given power to supply electricity within its district except in the area of an authorized distributor or a power company for any save certain specified purposes, unless consent is given, such consent not to be unreasonably withheld. Local authorities are given power to transfer their supply undertakings or their rights of purchase over supply companies' undertakings to joint authorities by agreement. Similar provision is made for the transfer of company undertakings to joint authorities. Under the heading of "Transitory Provisions" the Act enables the Board of Trade, at any time after an electricity district has been provisionally determined and until two years after a joint authority has been established, to carry out interim works, for which purpose the Treasury may issue out of the consolidated fund sums not exceeding £20,000,000 in the aggregate, such works to be vested later in the joint authority on repayment of capital cost and interest. Several amendments to the Electric Lighting Acts are made, notably with regard to overhead lines and wayleaves, all absolute vetoes being abolished. Joint authorities and municipal supply authorities are authorized to provide, let for hire, and connect, but not to manufacture or sell, electrical apparatus.

The Act applies to Scotland and Ireland with slight modifications, and provides that all the powers of the Board of Trade relating to electric supply shall be transferred to the Minister of Transport, to whom the electricity commissioners shall be wholly responsible. (These powers were formally transferred to the Minister of Transport on Jan. 23 1920 by an Order in Council, entitled the Ministry of Transport [Electricity Supply] Order, 1920.) In the 1920 session, and again in 1921, the Minister of Transport brought in a bill—the Electricity (Supply) bill—to amend the Act, with the chief object of conferring financial powers on joint electricity authorities. These authorities are to be empowered to borrow on the security of their revenues and property; and authorized undertakers, county and local authorities, and any local authority, company, or person receiving or intending to receive a supply of electricity are to be authorized to lend money, subscribe for securities, guarantee payment of interest, or give financial assistance in any other approved form to the joint authorities. The prices charged by a joint authority are to be so fixed that the receipts shall be sufficient to cover expenditure with such margin as the electricity commissioners may allow; and the commissioners may require such modifications in prices charged by authorized undertakers as will secure that the benefit of any reduction in the cost of electricity to the undertakers or in the capital employed shall accrue to consumers. Clause 14 makes the ordinary period of revision of maximum prices three years (instead of five under the Electric Lighting Acts, 1882 to 1909), and the provisions are extended to local authorities.

In pursuance of Section 5 (1) of the Electricity (Supply) Act, 1919, the electricity commissioners issued, during 1920, notices of the provisional determination of 13 electricity districts, as follows:—(1) Lower Severn; (2) Mid-Lancashire; (3) S.E. Lancashire; (4) W. Riding (Aire and Calder); (5) Mersey and W. Lancashire; (6) N. Wales and Chester; (7) London and Home Counties; (8) N.W. Midlands; (9) N.E. Midlands; (10) S.W. Midlands; (11) E. Midlands; (12) S. Wales; (13) N. Lancashire and S. Cumberland. For the guidance of organizing committees of supply engineers and representatives of local authorities and others interested, the commissioners had previously issued a statement on the procedure to be adopted at local inquiries into the delimitation of areas, and a memorandum setting out the technical and other particulars required in connexion with proposals for the formation of joint authorities. The holding of local inquiries was begun in 1921.

Growth of Associated Effort.—Apart from the Electricity (Supply) Act, 1919, and the changes wrought by the war, the most notable feature in the electric supply industry was the growth of representative associations. The municipal undertakings are represented in the Incorporated Municipal Electrical Assn. (founded in 1895); the electric power companies by the Incorporated Association of Electric Power Companies (registered in 1905); and the provisional order companies outside London by the Provincial Electric Supply Committee of the United Kingdom (formed in Jan. 1917). The majority of the metropolitan electric supply companies are represented by the London Electricity Joint Committee (1920), Ltd., and there is also a conference of local authorities owning electricity undertakings in Greater London. Similar associated effort has been manifested in other branches of the electrical industry, and the Institution of Electrical Engineers has provided a common platform upon which all sections could meet for the discussion of legislative and other problems. In June 1919 the British Electrical Development Assn. (director and secretary, Mr. J. W. Beauchamp) was formed (incorporated Jan. 17 1920) to further the interests of electrical progress by means of organized propaganda. This association is supported by the Institution of Electrical Engineers, the main associations representing the electricity supply industry, the British Electrical and Allied Manufacturers' Assn., the Electrical Contractors' Assn., and kindred electrical associations. During 1921 the British Electrical Development Assn. submitted to the electricity commissioners a lengthy memorandum on the subject of tariffs for electric supply undertakings. Multi-part tariffs, in which the flat rate per unit is replaced by a fixed charge intended to cover the capital cost of service and by a running charge, were strongly advocated as a means of stimulating the use of electricity for cooking, heating, and other purposes apart from lighting, and also of putting the finance of supply undertakings on a more satisfactory footing in view of the abnormal increases in the cost of plant, fuel, and labour brought about by the war. The commissioners were asked to include in the Electricity (Supply) bill a clause authorizing multi-part tariffs. At present such tariffs cannot be enforced, as the undertakings must offer, at least as an alternative, current at a flat rate with a maximum charge.

Joint Industrial Councils.—For the purposes of "Whitley" Councils to deal with questions of wages and conditions of labour in electric supply undertakings, the country has been divided into 13 districts, each with a district council representing employers and employed. The district councils are in turn represented on a national joint industrial council for the electricity supply industry (formed May 1919). There was also instituted, on Dec. 12 1919, a national joint board of employers and members of staffs for the electricity supply industry, to deal with all matters affecting salaries and conditions of employment of technical engineers. This board proposed to set up 13 district joint boards corresponding to those constituted by the national joint industrial council mentioned above.

Statistics.—The total British capital involved in 1920 by 334 electricity supply companies (this being the number for which returns were available) is given in Garcke's *Manual of Electrical Undertakings and Directory*, Vol. 24, as £72,812,872. In 1910 the corresponding figure for 239 companies was £47,047,847. Loans authorized to be raised by municipalities for electricity amounted to £70,836,470 (308 undertakings) in 1920 and to £42,617,969 in 1910 (316 undertakings). Over the same period the average dividend (on the whole of the capital) of electricity supply companies rose from 4·32 % to 5·58 %, the major part of this increase being due to the ordinary shares, which returned 6·51 % in 1920 as compared with 3·91 % in 1910. During 1920 the municipal undertakings showed a trading balance of £5,828,432. After providing for special charges, interest on loans, sinking fund, and depreciation and reserve, there was among the more successful undertakings an aggregate surplus of £621,385 and among the others a deficit of £260,852.

The total capacity of plant installed by companies and municipalities was, so far as could be definitely ascertained, 2,546,000 K.W. in 1920, with a load connected (equivalent 30-watt lamps) of 144,274,800, and an aggregate maximum load of 1,372,548 K.W. The Board of Trade units of electricity are recorded for 1920 as 3,086,382,748, and in 1910 as 1,027,420,254.

Further information on the above subjects may be gathered from the following publications: "Electric Power Supply during the Great War" (Part I.) by (Sir) A. B. Gridley and A. H. Human (*Jour. Inst. Elec. Engrs.*, vol. lvii., No. 282, May 1919); *Interim Report of the Coal Conservation Sub-Committee of the Reconstruction Committee on Electric Power Supply in Great Britain* (Cd. 8,880); *Report of the Board of Trade Committee on the Electrical Trades after the War* (Cd. 9,072); *Report of the Board of Trade Committee on Electric Power Supply* (Cd. 9,062); *Report of the Committee of Chairmen of the Advisory Council of the Ministry of Reconstruction on Electric Power Supply* (Cd. 93); *The Manual of Electrical Undertakings*, vols. xiii–xxiv. (A. G. W.)

United States.—The decade 1910–20, perhaps not so rich as its predecessor in fundamental electrical invention, showed so greatly increased a demand for electric current that much effort was applied to improving methods of production and supply. In many sections of the country all sources of water-power nearby were already employed so that it was necessary to transmit power two and three hundred miles. The highest voltages used in 1910 would be too low to be economical for such distances; during 1910–20 the use of transmission voltages in excess of 100,000 became fairly common; in 1921 220,000-volt lines were being completed. Larger generating units also became necessary. There were in operation in 1921 35,000-K.W. water-wheel units, and 50,000-K.W. units were to be used in Canada in 1922. Steam turbines of the multiple-unit type as large as 72,000 H.P. were operating in New York City and single-unit types up to 35,000 H.P. were operating successfully.

Because of the better light and smaller consumption of the tungsten lamp, which was made practicable by the discovery of a process for drawing tungsten wire, the demand for electric current grew rapidly. This lamp, by using less current, reduced the expenditure of every establishment using electric light, and it became necessary to develop a commercial organization to sell service. By 1921 virtually every electric light and power company maintained a selling organization. Much of the new demand was due to the war. The orders of the Allies for munitions in and after 1915 found the factories of North America ill-equipped to undertake so sudden an increase of production. It was quicker to buy electric power than to procure and install additional generating equipment. Then, later, a serious coal shortage made it apparent throughout the country that a central power-distributing organization was more economical and reliable than a number of small isolated plants. Added to the industrial demand thus suddenly thrust upon the power companies came a heavy demand from households for current for appliances. Domestics had been enticed from service by the munitions plants and electric labour-saving devices replaced them.

There were in 1921 nearly 7,000,000 homes in the United States wired for electric service, served by 5,600 electric light and power companies, the output of which for that year was expected to be about 42,000,000,000 K.W.-hours. From the sale of this current $1,050,000,000 would be obtained. The capital invested in these plants then amounted in round numbers to $4,500,000,000. The growth of retail outlets *per capita* for electrical merchandise increased nearly 400% during 1910–20, and the output of central power plants nearly 300%.

In spite of the lower consumption of current by the tungsten lamp the prices for electric current decreased steadily until 1916, when higher wages and costs of materials offset economies of efficient operation. About that time a number of supply companies initiated what is known as the "coal clause" in their contracts with consumers, under which the rate varied in a fixed ratio to the fluctuating price of coal. By the end of 1921, however, these clauses had begun to disappear. Household rates were not raised during the war, but later there were many increases. There was some urging of the London sliding scale of rates but in 1921 only two or three companies were using it. In fact, while during the first ten years of the century a great variety of rate-schedules was proposed and put into use, the second decade was free, comparatively, from such activity except perhaps for a form of household schedule which based the rate on the number and type of rooms plus a charge for current.

State regulation, which had appeared in a few states before 1910, by 1921 was found in nearly all states, and any attempt to substitute local regulation was opposed bitterly by the power companies. State regulation did more than anything else to free electricity supply from political interference. As a result term franchises were fast disappearing and were being replaced by indeterminate franchises.

No review of the decade's progress of electricity supply would be complete without reference to the great expansion of syndicate operation and management. Through the control by one company, usually known as a holding company, of numerous properties, a great saving was made. Central organizations have applied to small properties better engineering and management than they otherwise could have had. This also resulted in the discontinuance of small uneconomical plants and the substitution of large unified systems supplying many communities.

The advantages derived from unified systems became so significant that "super-power" projects began to be agitated. The United States Government became interested and an appropriation was made for an investigation of the power resources of the industrial region of the Atlantic seaboard, from Washington to Boston, under the auspices of the U.S. Geological Survey. This report was not yet published in Oct. 1921. It was known, however, that a vast network fed by a number of "super-power" plants would be recommended. Other surveys were being made by those locally interested in the South and in the North-West.

A little more than half of the current sold by power companies in the United States is generated by water-power. The development of the water-power resources of the country, however, was greatly retarded during 1910–20 by the threat of unfavourable Federal legislation. Congress considered for twelve years a water-power bill which was finally passed in 1920. Since its passage there has been a water-power stampede similar in many ways to the 1849 gold stampede to California. Applications were on file in 1921 for more than 51,000,000 H.P. and preliminary permits and licences had been granted to develop 2,255,696 H.P. The bill creates a Federal water-power commission, comprising three cabinet officers, the Secretaries of War, Agriculture and the Interior, to which is given authority over all matters over which the Federal Government has jurisdiction, pertaining to the development of water-powers in navigable streams, on the public domain and in the national forests.

The features of the bill are: (1) the erection of a commission (The Federal Power Commission); (2) the granting of a 50-year lease; and (3) the ability of the Government to resume control of the project on the payment of just compensation at the termination of the lease. Priority is given to national, state and municipal governments. On the Colorado river alone one company was planning to develop between three and four million H.P. of electrical energy.

In order further to assure continuity and reliability of central service, and also to make certain economies possible, the interconnexion of large power systems was introduced. One such system extends along the Gulf states, from Alabama to Georgia, through the Carolinas and into Tennessee. Another interconnects most of the important New England systems, and a third covers the great industrial region of Pennsylvania. California is connected from end to end, and the Rocky Mountain states are similarly linked. In addition there are other important but less extensive interconnexions; it would be possible by spanning a few gaps to interconnect almost the whole country.

Embraced in these interconnexions are certain large industrial plants. They interchange current with the public utilities under an arrangement beneficial to both. The tendency, however, is unmistakably toward service of all manufacturing plants by central stations. The only reason this has not gone further is that the power companies during 1915–21 were generating to their full capacity.

A survey made by the *Electrical World* of New York City shows that in 1920 there were 326,840 consumers of electric power in the United States. These were divided by sections as follows: New England, 35,300; Middle Atlantic, 50,950; South Atlantic, 19,200; North Central, 133,730; South Central, 22,370; Mountain, 10,690; and Pacific, 54,600.

Seventy-one central power companies had in 1921 an output of more than a hundred million K.W.-hrs. and nine in excess of a thousand million K.W.-hours. The three companies having the largest output were in 1920 the Niagara Falls (N.Y.) Power Co., 2,328,326,064 K.W.-hrs.; the Commonwealth Edison Co., Chicago, Ill., 1,883,570,000 K.W.-hrs.; and the Pacific Gas & Electric Co., San Francisco, Cal., 1,475,678,673 K.W.-hrs.

Municipal ownership sustained a great setback during the war because high costs of production added too much to city budgets. As a result a great many municipal plants went out of existence, their service being replaced by that of large transmission systems. Just before the war, however, there were some important additions to municipal operation, particularly in California and Ohio.

Another activity curtailed by the war was the organized sale of electric ranges. The provision by central stations of current for cooking before the war was becoming extremely important. Many cities had established a special range rate as low as 3 cents per K.W.-hour. High first cost, however, interrupted this activity, but in 1921 it seemed to be reviving. The practice in street lighting had been that the public utility service should own and maintain the lighting

system, but during 1910–20 there was a marked tendency toward municipal ownership of the system. The energy is purchased at the substation in bulk.

The latest statistics available for Canada are as of Jan. 1 1919 and show 795 central electric power stations in which the capital invested was $401,942,402. The total revenue from the sale of power was $53,549,133, for lighting purposes $16,952,512, and for all other purposes $36,596,621. The generating capacity at that time was 1,433,722 kva.

In Canada private operation seemed to be gradually giving way to provincial operation. The largest single system was that of the Ontario Hydro Electric Power Commission which with its latest acquisitions supplied about 1,000,000 horse-power. In 1921 this, the largest single electrical system in the world, developed under the direction of Sir Adam Beck, was being copied in other parts of Canada and was finding admirers in different parts of the United States, particularly California, where a similar system was proposed. The provincial systems were equivalent in effect to municipal control. The domestic rates were very low and as a result electricity was used quite extensively in the homes. A rate as low as one cent a K.W.-hr. was charged for electric cooking. (S. B. W.)

ELECTROCHEMISTRY (*see* 9.208) and **ELECTROMETALLURGY** (*see* 9.232).—Although these subjects are essentially connected, it will be convenient here to group separately the principal headings in each case under which notable advances had been made during 1910–21.

I. Electrochemistry

Alkalies and Chlorine.—The electrolytic methods of producing alkalies and chlorine by the decomposition of brine made remarkable progress during the period 1911–20. Electrolytic alkali works are now being operated in all the leading manufacturing countries where the raw materials of the industry are found; and even those who control the operation of the old Le Blanc process of alkali manufacture in the United Kingdom have found themselves at last compelled, by the force of circumstances and by the changing conditions of the trade and industry, to adopt the newer method of decomposing salt.

The cells now being operated industrially may be classified as diaphragm and non-diaphragm cells. In the former class, a porous diaphragm, composed of cement, asbestos or other material unacted upon by the electrolyte (or by the ions produced by the electrolysis), is employed to separate the cell into two or more compartments, and in this way the chlorine liberated at the anode is to a large extent prevented from taking part in secondary reactions with the sodium or potassium hydrate formed at the cathode.

The "Elektron," Hargreaves-Bird, Outhenin-Chalandre, Basel, Billiter-Siemens, Nelson, Allen-Moore, Gibbs and Townsend cells are all of this type, the chief difference between them being in the construction or design of the diaphragm and in the arrangements made for withdrawing the sodium-hydrate solution from the cathode compartment of the cell, before it has had time to be decomposed by the electric current. The defects of all diaphragm cells are the higher voltage required per cell, and the increased costs of maintenance, due to the lack of durability on the part of the diaphragm.

For these reasons the other class—namely, non-diaphragm cells—always attracted the electro-chemist, and many of these have been patented and tried. Only two types have survived industrial trial—namely, (1) the Castner-Kellner, Whiting and Solvay cells, which employ a moving mercury electrode in the cathode compartment of the cell, and thus produce an amalgam of sodium which can be removed from the cell before it is decomposed; and (2) the "bell" type of gravity cell, which makes use of the different specific gravities of the brine, and of the newly-formed sodium or potassium hydrate solution, in order to effect a separation of the two. The Aussig "bell" cell and the Billiter-Leykam cell are the only two representatives of this class in actual operation; the Richardson and Holland cell, which was tried on a large scale at St. Helens in the years 1896–1900, having proved a failure.

The attempts to use molten lead in place of the more expensive mercury in the liquid or moving electrode cells have also failed, after trial upon an industrial scale; the wear and tear of the cell structure, and the fire dangers with this type of cell, having caused the suspension of operation of the Hulin cell at Les Clavaux in France, and of the Acker cell at Niagara Falls in America. The works where the latter cell and process were operated was, in fact, burnt down some few years ago, and has not been rebuilt.

The World War caused a considerable increase in the number and capacity of the works for the electrolytic decomposition of brine, liquid chlorine being required in very large amounts by the military authorities, not only for gas-warfare but also for sterilizing water supplies. The U.S. Government in 1918 planned and erected a large works of this type at the Edgewood Arsenal, equipping it with 3,552 cells of the Nelson (diaphragm) type in order to provide the army authorities with all the liquid chlorine they required. At the date of the Armistice, this plant could have produced *100 tons* of chlorine gas per day of 24 hours, if worked to the full.

The figures in Table I are drawn from the most reliable sources, and give a useful summary of the comparative efficiencies of the various cells as operated in 1921, and the strength of the caustic-soda solution they produce. It will be noticed that the cells with the highest current and energy efficiencies give the weakest solution of sodium hydrate at the cathode, and that in order to obtain a fairly concentrated cathode liquor, one must sacrifice to some extent the electrical efficiency of the process.

Table I.

Comparative Efficiencies of the Leading Types of Electrolytic Alkali and Chlorine Cells.

(Allmand's and Kershaw's Figures.)

Type of Cell	Cathode Efficiency %	Energy Efficiency %	Voltage	Concentration Grammes per litre NaOH	K.W. hrs. per Kgm. NaOH
Finlay	98	75	3·0	80	2·0
Billiter-Siemens	92	68	3·1	120	2·3

*This cell produces Na_2CO_3—not NaOH.

To produce one ton of solid caustic soda from a solution containing only 80 grammes per litre of NaOH (the strength produced by the Finlay cell) means the evaporation of over 12 tons of water; whereas with a cathode liquor containing 240 grammes NaOH per litre (the strength produced by the mercury cell processes), only one-half this weight of water will have to be evaporated to obtain the solid product, and the fuel consumption will thus be reduced 50%.

The answer to the question which cell is the best for the production of solid caustic soda or potash depends, therefore, largely upon the relative costs of electric power and of solid fuel in the locality where the cell is to be operated. The Whiting, Castner-Kellner, and Wilderman mercury cells, as shown by the table, all yield cathode liquors of fairly high concentration—200 to 240 grammes NaOH per litre. If the cost of mercury were not so high, they would be generally adopted for the production of caustic hydrates and chlorine, in spite of their rather low energy efficiencies, since they also yield a specially pure product at both the anode and cathode.

Of the diaphragm types of cell, the Billiter-Siemens, Billiter-Leykam, Townsend and Nelson cells all yield a liquor containing 120–160 grammes NaOH per litre, and, therefore, come next to the mercury cells. No figures for the concentration of caustic liquor or the efficiency of the Gibbs cell are available.

The Aussig bell, Griesheim, and Outhenin-Chalandre cells, on the other hand, yield a liquor containing only 60–80 grammes NaOH (or under) per litre, and in view of the amount of fuel required to produce solid caustic from such weak liquor, it is surprising that these cells have attained so wide a use on the continent of Europe.

Chlorates, Perchlorates and Persalts generally.—The electrolytic method of manufacture of chlorates and perchlorates of potash and soda was in 1921 being worked in all countries where cheap electric power was available, the most notable works being that of Messrs. Corbin & Cie, at Chedde, in the Haute Savoie department of France, and at Trollhattan in Sweden. The cells used at Chedde are constructed of cement, and are arranged in terraces so that the electrolyte flows through them by gravity. Very thin sheets of platinum-foil fixed in ebonite frames act as bipolar electrodes in series, the number of electrodes per cell and of cells in a circuit being arranged to suit the voltage of the generators. The electrolyte used is a 25 to 30% solution of KCl or NaCl; a current density of 100 to 200 amperes per sq. ft. of anode surface is employed. This leads to a high E.M.F.

being required, even though the electrolyte is heated to 70° C. and the bipolar electrodes are only ½ in. apart.

When potassium chloride is employed as electrolyte, the chlorate can be easily separated by crystallization on cooling from the mother-liquor containing the unaltered chloride; but when sodium chlorate is being produced, different treatment is required to obtain separation of the chloride and chlorate, since the sodium salt is much more soluble than potassium chlorate. The current efficiency when producing either sodium or potassium chlorate can be raised to 90%. when the process is well-managed; and the conversion of chloride into chlorate is completed in one operation.

Were it not for the fact that no satisfactory substitute for platinum can be found as electrode material for chlorate cells, and that consequently the capital costs of the cell installation are very high, the electrolytic process of chlorate manufacture would before now have quite supplanted the older chemical process, which is still operated in the few places where the Le Blanc process survives.

The conditions required in order to obtain *perchlorates*, and other highly oxidized salts such as persulphates, in an electrolytic cell are: —(1) Insoluble electrodes; (2) a high current density at the anode; (3) the prevention of any reducing action by the hydrogen liberated at the cathode. This latter condition is obtained, either by the use of a diaphragm between the two compartments of the cell, or by the employment of salts, such as chromates or cyanides, which serve to suppress the cathodic reduction.

According to the most reliable information, perchlorates are now produced by electrolyzing a concentrated solution of sodium chlorate, containing 600–700 grammes per litre of this salt, at a temperature of 10° to 30° C. with a current density of 400–500 amperes per sq. foot. When the chlorate content of the electrolyte falls below 100 grammes per litre, the resistance of the bath increases considerably, and the temperature rises to 45° to 50° C. with a reduction of the current density to 270 amperes per sq. foot. If the chlorate concentration of the electrolyte falls below 10 grammes per litre, much ozone is given off, and the evolution of this gas may increase to such an extent that the workmen in the cell rooms are affected injuriously. Under normal conditions, however, the conversion of the chlorate into perchlorate proceeds without evolution of ozone, and with an average efficiency of 85%; the power required to produce 1 kgm. of sodium perchlorate from chlorate being 3½ K.W.-hrs. As the sodium salt is deliquescent it is not worked up as such, but the potassium salt is precipitated by adding potassium chloride. The ammonium salt is prepared similarly, by treating the sodium perchlorate solution with ammonium chloride; or the ammonium salt can be produced by starting with calcium chloride, and by converting this by successive stages of anodic oxidation into calcium perchlorate, which is finally decomposed by the ammonium chloride, to yield ammonium perchlorate.

Sodium perborate is produced in a similar manner, by electrolyzing solutions of sodium borate; and as this salt has found a wide application in the arts and industries, some further details of its method of manufacture may be given here. The process employed is based on the use of a mixed solution of sodium borate and an alkaline carbonate as electrolyte, with the addition of some substance which will coat the cathode with a colloidal or other deposit that lowers the reducing action of any hydrogen liberated at this point; chromic acid being most suitable for this purpose. During the electrolysis, the strength of the alkali carbonate solution must be maintained, preferably by the presence of the solid salt; but towards the end of the electrolysis this solid carbonate can be allowed to go into solution. Sodium borate must also be present in the solid state during the electrolysis, in order to keep up the concentration of the electrolyte. The presence of magnesium silicate, stannic acid and alkali bicarbonates is said to accelerate the conversion of the borate into the persalt. The latest theory of the conversion is, that percarbonate is first formed, and that this salt then reacts with the sodium borate to yield sodium perborate during the course of the electrolysis; in any case, for the success of this method of production, the presence of solid perborate in the cell appears to be necessary.

Persulphates and Hydrogen Peroxide.—Persulphates are another class of highly oxidized salts which are finding a wide application in the arts and industries, especially in photography, and here again the electrolytic method of production is the simplest and most efficient.

As a practical matter, in judging the comparative merits of the chemical and electrolytic methods for producing these persalts and compounds, it is necessary to note that the cost of the electric current, when producing pure chemicals of this type, is not a very serious item in the total cost of production. As a rule, the desired salt can be produced in a pure state by one simple operation in the electrolytic cell or bath; and this of course is a factor in the economy of the electrolytic methods which must not be overlooked in judging the comparative cost of electrolytic and chemical methods of manufacture of what are usually classed as " fine " chemicals.

The method of producing persulphates in the electrolytic cell is based upon the discharge of SO_4 ions at the anode of the cell. The conditions required to effect this discharge are the same as in the case of the production of perchlorates:—(*a*) A low temperature; (*b*) a high current density with a smooth platinum anode; (*c*) an acid solution, or one at least free from alkali.

When employing a diaphragm type of cell, a concentrated solution of ammonium sulphate is employed in the anode compartment of the cell and sulphuric acid of medium strength in the cathode compartment. Smooth platinum must be employed as anode material, but lead can be employed as cathode; and the cathodes may be of much larger surface area than the anode.

Two methods have been employed for the production of *hydrogen peroxide* by electrolysis; the one based upon the use of persulphuric acid as intermediate product, and the other upon the use of potassium or ammonium persulphate. The conditions which necessarily should be observed in the first method are as follows:—(1) The density of the sulphuric acid should be between 1·35 and 1·50; (2) the electrolysis should be carried out as rapidly as possible; (3) the current density should be high, about 950 amperes per sq. ft.; (4) the solution must be cooled, or a hollow anode may be used, cooled internally by the circulation of water at 15° to 20° C.

Hypochlorites.—It is noteworthy that Charles Watt, in his very remarkable patent No. 13,755 of 1851, clearly explained all the conditions which must be maintained in the cell in order to produce hypochlorites by the electrolytic decomposition of sodium or potassium chloride solutions. The advances that have been made since that year have been simply in the form and design of the apparatus used for carrying out the electrolytic method. The leading features of the modern cells, designed specially for hypochlorite production, are, however, very similar. They all possess graphite or platinum electrodes, placed close together so that the chlorine liberated at the anode reacts at once with the alkaline hydrate formed at the cathode; and they possess also some mechanism for promoting the rapid circulation and cooling of the electrolyte, in order to avoid the formation of chlorate. The three leading types of electrolyzer, for the production of bleaching solutions, are:—(1) the Haas and Oettel (or " Manchester," as it is now called), (2) the Kellner, and (3) the Mather and Platt.

The latest form of the Manchester electrolyzer, as operated in 1921, makes use of carbon as electrode material, and of the liberation of hydrogen at the cathode, to effect automatic circulation and mixing of the liquid. The inner or working cell is a rectangular stoneware tank, divided by the carbons into 30 narrow compartments or cells. The first and last carbons of the set form the main electrodes of the cell; the intervening carbons act as secondary electrodes, *i.e.* as anodes on the one face and cathodes on the other. This electrolyzer holds 750 litres of 15% brine, and takes 75 to 80 amperes at 110 volts. Its output in 10 hours equals 10·5 kgm. of active chlorine.

The Kellner electrolyzer consists of a shallow stoneware tank, divided into a large number of narrow cells by means of vertical glass plates, so arranged that the electrolyte is obliged to take a zig-zag course in its passage through the electrolyzer. The electrodes are formed of platinum-iridium gauze and are arranged horizontally, with the anodes below the cathodes, so that the chlorine liberated at the former may be absorbed by the supernatant liquid. This electrolyzer is constructed usually to take a current at 110 volts, and has only two terminal electrodes; all the intervening electrodes function as secondary electrodes. The Kellner electrolyzer holds 820 litres of brine testing 15%, and requires a 90-ampere current at 110 volts. Its output in 10 hours equals 15·0 kgm.

The Mather and Platt electrolyzer is constructed on the filterpress principle, with a trough for supply of the brine running along the top of the frame. The frame holds 22 separate cells fixed transversely, and the brine feeds these through a perforated tray in fine streams which break up into drops on falling and thus prevent current leakage. The 22 cells forming one electrolyzer are placed in one frame, and are connected in series. They take a current of 250 amperes at 110 volts. The salt consumption is 10·3 lb. salt, and the power consumption is 2½ K.W.-hrs. per lb. of available chlorine produced.

In recent years the direct production of hypochlorites and bleaching solutions by electrolysis has been curtailed. It has been found more economical to use the chlorine gas obtained from the electrolytic alkali cells for this purpose, and to absorb this either in the milk of lime, or in the hydrate solution produced at the cathode, the absorption taking place in a separate vessel outside the cell.

Oxygen and Hydrogen.—The electrolysis of acidulated water to show that it is composed of two gases, and the recombination of these gases by explosion to form drops of water, is one of the oldest of chemical lecture-table experiments; and it is not surprising, therefore, that cells for producing oxygen and hydrogen upon a commercial scale, by electrolytic methods, have been

patented and operated. The Schoop, Garuti, and Schukert cells were the best known of these. The first-named used sulphuric acid, while the remaining two employed caustic potash as electrolyte; the power consumption being 5·9 and 4·1 K.W.-hrs. respectively per cubic metre of the mixed gases.

In recent years, however, oxygen has been more economically obtained by the fractional distillation of liquid air, which can now be produced very cheaply; and hydrogen is obtained either from electrolytic alkali cells (as a waste product), or from blue water gas, by improvements of the old iron-contact process. By means of this, the carbon monoxide is first oxidized to CO_2 and is then removed from the gas mixture by absorption. The electrolytic production of hydrogen and oxygen is, therefore, now carried on in only a few localities, and for the few industries where both gases are required for immediate use in their relative combining proportions, as in the oxyhydrogen blowpipe.

Ozone.—Since most of the early patents for ozone apparatus have lapsed by efflux of time, the general type of apparatus for the production of ozonized air, as placed on the market in 1921 has been standardized.

Ozonizers now usually consist of an inner cylinder of sheet copper or aluminium, connected to the high-tension side of the transformer and well insulated, and an outer metal cylinder which is connected to the casing of the ozonizer, and is kept at zero or earth-potential. The two cylinders are separated by a glass tube through which the air is passed, and the silent discharge takes place in the annular air-space between the two metal sheets. The outer sheet of metal is water-cooled, and thick glass windows at each end of the ozonizer tube enable the operator to see if the discharge through the air-gap is occurring in a proper manner. Alternating currents with frequencies up to 60 cycles are employed for these installations; and the practical limit of E.M.F. has been found to be 10,000 to 12,000 volts.

Ozonized air has been employed for bleaching wax, textiles, paper-pulp and sponges; for the sterilization of air and food; and also for the acceleration of the drying and hardening processes in paints and varnishes, and for the rapid oxidation of oils.

Organic Products.—It is difficult to obtain any information as to the extent to which electrolytic methods have been and are being applied in 1921 outside the laboratory in the field of organic chemistry; but there is reason to believe that in Germany considerable progress had been made in this direction, and that not only *bromoform* and *iodoform* but also *anthraquinone* and other organic products have been produced electrolytically.

Phosphorus.—At one time the electrothermal process for the production of phosphorus from bone-ash was being employed at Oldbury, near Birmingham, and at Niagara Falls, and an output of 30 tons per month was reported to have been attained. The bone-ash was mixed with silicic acid (sand) and carbon, and the mixture was then heated to between 1300° and 1500°C. The phosphorus commenced to distil over at 1150°C. and was all expelled from the mixture before a temperature of 1450°C. was reached. According to Hempel, this method of manufacture had also been used in Germany, gas-tight iron cylinders lined with fire-clay being used as the furnaces in which the raw materials were heated. The use of silicic acid (or sand) to produce a calcium-silicate slag, it must be noted, is only practicable with methods of reducing calcium phosphate which render this slag quite fluid, a result that can be attained only by aid of electric heat. Molten calcium silicate is also very corrosive, and the advantage of the internal system of heating is that the outer walls of the furnace can be artificially cooled, and a layer of cold slag can be formed to protect the refractory lining from the action of the slag.

A process very similar to that described above, for the manufacture of phosphorus, was brought out in America and patented some years ago in the name of Machalske. The furnace used for operating this process possessed an internal chamber, measuring 12 in. x 18 in. and was provided with a carbon bottom, sides of calcined magnesia, and a cover of fire-clay and red brick. Two electrodes, each 8 ft. in length by 4 in. in diameter, passed through holes in the cover. With electric power at 3 cents per e.h.p.-hr., Machalske claimed that yellow phosphorus could be produced by this method at a total cost of 7 cents per pound.

From 80 % to 92 % of the phosphorus can be recovered by this method of manufacture; the balance remains in the furnace or retort as calcium silicophosphate, and it cannot be expelled by any increase of the temperature.

II. Electrometallurgy

Aluminium.—There were no discoveries or marked advances during the period 1910–20 in the development of new sources of aluminium, and the mineral *bauxite* remains the chief raw material of the industry. The increased demand for bauxite, however, has led to several new deposits being opened up and worked, and although none of these equal in purity the French bauxite deposits, the mineral has been found to be much more widely distributed over the world than was at one time supposed. With the aim of reducing the cost, numerous attempts have been made to dispense with the preliminary purification of the alumina (*see* 1.767–770) and to operate the baths with the raw bauxite, but these so far have not proved successful. In time this improvement in the electrolytic process and reduction in cost of aluminium manufacture will no doubt be achieved.

The world's production of bauxite in recent years is given in Table I, which is taken from a pamphlet published in 1921 by the Imperial Resources Bureau. As regards alternative sources of supply, silicate of aluminium or clay is one of the most widely distributed materials which occur in the crust of the earth. Weaver, in a recent Canadian patent (No. 190,054 of 1919), proposes to open up this source of aluminium and its salts by treating the clay with chlorine in the presence of carbon. This leads to the formation of $AlCl_3$, $SiCl_4$ and CO, and with cheap supplies of liquid chlorine the method might be practicable. The chlorides are separated, and the metal is extracted by the electrolytic method described below. Whether this suggested process of using $AlCl_3$ in place of Al_2O_3 as raw material for the aluminium industry will prove successful remains for the future to disclose.

Production and Output.—The electrolytic process by which aluminium is produced from alumina, as worked in 1921, differed but little from that by which Heroult, at Neuhausen in Switzerland, and Hall, at New Kensington in America, first started the manufacture upon an industrial scale in 1889. The production, however, is now concentrated in the hands of a small group of powerful companies.

As regards the growth of the industry, the figures in Table II, taken from the pamphlet already referred to, indicate very clearly the remarkable expansion which has occurred in the manufacture during the period 1910–20. Compared with the figures compiled by J. B. C. Kershaw some years previously for the period 1893–9, the expansion of the industry becomes even more striking:

	1893	1894	1895	1896	1897	1898	1899
Total World Output (tons)	713	1,057	1,129	1,755	3,327	3,953	5,459

In twenty years, therefore, the world's output of aluminium had increased from 5,000 to 150,000 tons, and the metal had come to rank 4th in the list of nonferrous metals, when judged by the standard of consumption; for only copper, zinc and lead are employed in larger amounts in the arts and industries. The remarkable increase in production which marked the war period was of course due to war requirements; aluminium being used in enormous amounts not only in the powdered form for paints, and as an ingredient of certain forms of explosive (such as "ammonal"), and of pyrotechnical materials, but also being employed, either as pure metal or in the alloyed state, for the construction of airships, aeroplanes, motor-cars, fuses, bombs, radiators and many forms of measuring instruments. The close of the war occasioned, therefore, a very considerable drop in the demand for the metal—but there was little doubt that later the demand for aluminium in the arts and industries would more than absorb the production of the increased plant.

As regards the localities and works where aluminium is now produced, these are in every case operated by water-power, and the names of the companies and locations of the works are as follows:—

United Kingdom.

British Aluminium Co.—Foyers and Kinlochleven, Scotland (Stangfjord, Vigelands, Norway).
Aluminium Corporation Ltd.—Dolgarrog, North Wales.

France.

Soc. Electrometallurgique française.—Le Praz, Gardanne.
Compagnie des Produits chemiques d'Alais.—Calypso, St. Jean de Maurienne, St. Felix.

Switzerland, Germany and Austria.

Aluminium Industrie Aktien-Gesellschaft.—Neuhausen, Rheinfelden, Lend Gastein.

United States of America and Canada.

Aluminium Co. of America.—Niagara Falls, Massena, Shawinigan Falls.

Italy and Norway also possess aluminium works, and during the war two or three factories were started in the highlands of Bavaria for the production of the metal, by the Allgemeine Elektricitäts Gesellschaft, of Berlin. The figures given in Table II show that during the last year of the war Germany produced 25,000 tons of aluminium, and was second only to the United States in her output

being required, even though the electrolyte is heated to 70° C. and the bipolar electrodes are only ⅛ in. apart.

When potassium chloride is employed as electrolyte, the chlorate can be easily separated by crystallization on cooling from the mother-liquor containing the unaltered chloride; but when sodium chlorate is being produced, different treatment is required to obtain separation of the chloride and chlorate, since the sodium salt is much more soluble than potassium chlorate. The current efficiency when producing either sodium or potassium chlorate can be raised to 90%. when the process is well-managed; and the conversion of chloride into chlorate is completed in one operation.

Were it not for the fact that no satisfactory substitute for platinum can be found as electrode material for chlorate cells, and that consequently the capital costs of the cell installation are very high, the electrolytic process of chlorate manufacture would before now have quite supplanted the older chemical process, which is still operated in the few places where the Le Blanc process survives.

The conditions required in order to obtain *perchlorates*, and other highly oxidized salts such as persulphates, in an electrolytic cell are: —(1) Insoluble electrodes; (2) a high current density at the anode; (3) the prevention of any reducing action by the hydrogen liberated at the cathode. This latter condition is obtained, either by the use of a diaphragm between the two compartments of the cell, or by the employment of salts, such as chromates or cyanides, which serve to suppress the cathodic reduction.

According to the most reliable information, perchlorates are now produced by electrolyzing a concentrated solution of sodium chlorate, containing 600–700 grammes per litre of this salt, at a temperature of 10° to 30° C. with a current density of 400–500 amperes per sq. foot. When the chlorate content of the electrolyte falls below 100 grammes per litre, the resistance of the bath increases considerably, and the temperature rises to 45° to 50° C. with a reduction of the current density to 270 amperes per sq. foot. If the chlorate concentration of the electrolyte falls below 10 grammes per litre, much ozone is given off, and the evolution of this gas may increase to such an extent that the workmen in the cell rooms are affected injuriously. Under normal conditions, however, the conversion of the chlorate into perchlorate proceeds without evolution of ozone, and with an average efficiency of 85%; the power required to produce 1 kgm. of sodium perchlorate from chlorate being 3½ K.W.-hrs. As the sodium salt is deliquescent it is not worked up as such, but the potassium salt is precipitated by adding potassium chloride. The ammonium salt is prepared similarly, by treating the sodium perchlorate solution with ammonium chloride; or the ammonium salt can be produced by starting with calcium chloride, and by converting this by successive stages of anodic oxidation into calcium perchlorate, which is finally decomposed by the ammonium chloride, to yield ammonium perchlorate.

Sodium perborate is produced in a similar manner, by electrolyzing solutions of sodium borate; and as this salt has found a wide application in the arts and industries, some further details of its method of manufacture may be given here. The process employed is based on the use of a mixed solution of sodium borate and an alkaline carbonate as electrolyte, with the addition of some substance which will coat the cathode with a colloidal or other deposit that lowers the reducing action of any hydrogen liberated at this point; chromic acid being most suitable for this purpose. During the electrolysis, the strength of the alkali carbonate solution must be maintained, preferably by the presence of the solid salt; but towards the end of the electrolysis this solid carbonate can be allowed to go into solution. Sodium borate must also be present in the solid state during the electrolysis, in order to keep up the concentration of the electrolyte. The presence of magnesium silicate, stannic acid and alkali bicarbonates is said to accelerate the conversion of the borate into the persalt. The latest theory of the conversion is, that percarbonate is first formed, and that this salt then reacts with the sodium borate to yield sodium perborate during the course of the electrolysis; in any case, for the success of this method of production, the presence of solid perborate in the cell appears to be necessary.

Persulphates and Hydrogen Peroxide.—Persulphates are another class of highly oxidized salts which are finding a wide application in the arts and industries, especially in photography, and here again the electrolytic method of production is the simplest and most efficient.

As a practical matter, in judging the comparative merits of the chemical and electrolytic methods for producing these persalts and compounds, it is necessary to note that the cost of the electric current, when producing pure chemicals of this type, is not a very serious item in the total cost of production. As a rule, the desired salt can be produced in a pure state by one simple operation in the electrolytic cell or bath; and this of course is a factor in the economy of the electrolytic methods which must not be overlooked in judging the comparative cost of electrolytic and chemical methods of manufacture of what are usually classed as "fine" chemicals.

The method of producing persulphates in the electrolytic cell is based upon the discharge of SO_4 ions at the anode of the cell. The conditions required to effect this discharge are the same as in the case of the production of perchlorates:—(*a*) A low temperature; (*b*) a high current density with a smooth platinum anode; (*c*) an acid solution, or one at least free from alkali.

When employing a diaphragm type of cell, a concentrated solution of ammonium sulphate is employed in the anode compartment of the cell and sulphuric acid of medium strength in the cathode compartment. Smooth platinum must be employed as anode material, but lead can be employed as cathode; and the cathodes may be of much larger surface area than the anode.

Two methods have been employed for the production of *hydrogen peroxide* by electrolysis; the one based upon the use of persulphuric acid as intermediate product, and the other upon the use of potassium or ammonium persulphate. The conditions which necessarily should be observed in the first method are as follows:—(1) The density of the sulphuric acid should be between 1·35 and 1·50; (2) the electrolysis should be carried out as rapidly as possible; (3) the current density should be high, about 950 amperes per sq. ft.; (4) the solution must be cooled, or a hollow anode may be used, cooled internally by the circulation of water at 15° to 20° C.

Hypochlorites.—It is noteworthy that Charles Watt, in his very remarkable patent No. 13,755 of 1851, clearly explained all the conditions which must be maintained in the cell in order to produce hypochlorites by the electrolytic decomposition of sodium or potassium chloride solutions. The advances that have been made since that year have been simply in the form and design of the apparatus used for carrying out the electrolytic method. The leading features of the modern cells, designed specially for hypochlorite production, are, however, very similar. They all possess graphite or platinum electrodes, placed close together so that the chlorine liberated at the anode reacts at once with the alkaline hydrate formed at the cathode; and they possess also some mechanism for promoting the rapid circulation and cooling of the electrolyte, in order to avoid the formation of chlorate. The three leading types of electrolyzer, for the production of bleaching solutions, are:—(1) the Haas and Oettel (or "Manchester," as it is now called), (2) the Kellner, and (3) the Mather and Platt.

The latest form of the Manchester electrolyzer, as operated in 1921, makes use of carbon as electrode material, and of the liberation of hydrogen at the cathode, to effect automatic circulation and mixing of the liquid. The inner or working cell is a rectangular stoneware tank, divided by the carbons into 30 narrow compartments or cells. The first and last carbons of the set form the main electrodes of the cell; the intervening carbons act as secondary electrodes, *i.e.* as anodes on the one face and cathodes on the other. This electrolyzer holds 750 litres of 15% brine, and takes 75 to 80 amperes at 110 volts. Its output in 10 hours equals 10·5 kgm. of active chlorine.

The Kellner electrolyzer consists of a shallow stoneware tank, divided into a large number of narrow cells by means of vertical glass plates, so arranged that the electrolyte is obliged to take a zig-zag course in its passage through the electrolyzer. The electrodes are formed of platinum-iridium gauze and are arranged horizontally, with the anodes below the cathodes, so that the chlorine liberated at the former may be absorbed by the supernatant liquid. This electrolyzer is constructed usually to take a current at 110 volts, and has only two terminal electrodes; all the intervening electrodes function as secondary electrodes. The Kellner electrolyzer holds 820 litres of brine testing 15%, and requires a 90-ampere current at 110 volts. Its output in 10 hours equals 15·0 kgm.

The Mather and Platt electrolyzer is constructed on the filterpress principle, with a trough for supply of the brine running along the top of the frame. The frame holds 22 separate cells fixed transversely, and the brine feeds these through a perforated tray in fine streams which break up into drops on falling and thus prevent current leakage. The 22 cells forming one electrolyzer are placed in one frame, and are connected in series. They take a current of 250 amperes at 110 volts. The salt consumption is 10·3 lb. salt, and the power consumption is 2½ K.W.-hrs. per lb. of available chlorine produced.

In recent years the direct production of hypochlorites and bleaching solutions by electrolysis has been curtailed. It has been found more economical to use the chlorine gas obtained from the electrolytic alkali cells for this purpose, and to absorb this either in the milk of lime, or in the hydrate solution produced at the cathode, the absorption taking place in a separate vessel outside the cell.

Oxygen and Hydrogen.—The electrolysis of acidulated water to show that it is composed of two gases, and the recombination of these gases by explosion to form drops of water, is one of the oldest of chemical lecture-table experiments; and it is not surprising, therefore, that cells for producing oxygen and hydrogen upon a commercial scale, by electrolytic methods, have been

power from some small central station plant may be compelled to select the two-phase Rennerfelt arc furnace instead of the single-phase Rocking Detroit furnace, because the latter type of current cannot be economically provided for one power user alone.

The figures in the accompanying table are given by Gillett for the output and power consumption of the various furnaces named above, when melting brass and bronze.

The electrolyte contains 30 % free HCl and 80 to 85 grammes of gold per litre, with varying amounts of platinum and palladium. When the amount of these latter two metals in solution is sufficient to render it worth the expenditure of time and chemicals, a portion is withdrawn, and the platinum and palladium are then separated and can be refined by the appropriate chemical and metallurgical methods of treatment.

Type of Furnace	Power required K.W.	Charge of metal in lb.	Output per day in tons		Power consumption in K.W.-hrs. per ton	
			10 hrs.	24 hrs.		
1. Ajax-Wyatt	30	300	1–1½	3–3½	325	267
(Yellow brass)	60	600	2½–3	6–7	275	218

	300	2000	6–7	16–20	287	237

Nos. 3, 4 and 5 use from 2½ lb. to 6 lb. of graphite electrodes per ton of metal charged.

Bullion.—"Bullion" is the technical term for the alloys of the precious metals silver and gold; the name is also applied to the bars or ingots in which these metals are sold (for coinage purposes) to the mint authorities of the various countries of the world. Although chemical and metallurgical methods are still employed for separating or "parting" the silver and gold in bullion from one another, and from the baser metals with which they are often associated, since the year 1895 electrolytic methods have been making steady progress, and at the present time a very large proportion of the silver output of the world is electrolytically refined by aid of the Moebius process. As regards gold, the electrolytic method is also making progress; and electrolytic refineries for treatment of gold bullion by the Wohlwill process have been operated at Frankfort, Hamburg, Paris, New York, Philadelphia and San Francisco.

The chief disadvantages of the electrolytic methods of bullion-refining are those resulting from the value of the gold and silver locked up by the processes; and the latest improvements, therefore, are directed chiefly towards reducing the volume of the solutions in the tanks, and also the time required for the refining.

The Moebius process of silver-refining has already been fully described (*see* 25.115). The following description of one of the latest plants erected is of interest, since it shows that the horizontal system of travelling belts which act as cathodes has been dropped, and that the vertical type of anode, enclosed in bags, has been reintroduced. The plant is attached to the Amboy Refinery of the American Smelting & Refining Co., and consists of 144 stoneware tanks, grouped in 24 sections of 6 tanks each. The anodes weigh 100 oz. and are cast by hand in the lead refinery. The cathodes are made from cold-rolled silver sheets $\frac{1}{32}$ in. thick. Each tank contains 4 anode bags and 5 cathodes, the bags each holding 4 anode bars. The electrolyte is a neutral nitrate solution, containing, per litre, 15 to 20 grammes silver and 30 to 40 grammes copper; 75 % of the silver in the anode can be deposited in 24 hours. The deposit upon the cathodes is continuously removed by means of wooden sticks attached to a frame which has a reciprocating motion. A current density of 40 amperes per sq. ft. can be maintained under these conditions since no treeing of the silver can occur, owing to the continuous removal of the crystalline deposit.

The bags which surround the anodes receive all the slime, and are removed at regular intervals for recovery of the gold and other precious metals. The slimes are first boiled with sulphuric acid of 1·842 Sp. Gr. in order to remove copper and silver, the residue is then washed, dried, and cast into anodes for treatment by the Wohlwill process.

The gold-recovery installation at Perth Amboy is equipped with 5 earthenware cells, and a current density of 150 amperes per sq. ft. is employed. This density is considerably higher than that used in the early trials of the Wohlwill process, the object of the increase being, of course, to reduce the standing charges for interest per unit of output. One special feature of this installation is the use of mercury cups on the ends of the copper bus-bars. By aid of these cups, and cross bars of copper with bent ends to fit into these cups, any unit can be quickly cut in or cut out of the circuit. The cathodes are thin sheets, rolled from electrolytic gold, and are connected to the contact bars by bending one end of the sheet round them, and by fastening this down with a clip.

Cadmium.—This metal was produced during the World War period in America, by the electrolysis of acid solutions of the sulphate, freed from all impurities by chemical treatment.

The electrolysis was carried out in semi-circular lead-lined tanks, provided with rotating disc-shaped cathodes of aluminium sheet, $\frac{1}{8}$ in. in thickness. Under these conditions, smooth coherent deposits of metallic cadmium could be obtained, when using a current density of 15 amperes per sq. ft. of immersed cathode area. The average weight of cadmium deposited per 24 hours in the plant referred to above was 113 lb. per tank, and the current efficiency was 85 %.

As regards output in 1914, 91,000 lb. of metallic cadmium were produced in the United States, and the total had increased to 207,000 lb. in 1917. No figures were yet available in 1921 for the German output during the war years, but it was known that they also produced large amounts of cadmium and used it as a substitute for tin, in the manufacture of solders. The low melting-point of cadmium renders it useful also in the manufacture of fusible plugs in sprinkler systems of fire protection; and it has also been employed in conjunction with lead for the manufacture of bearing metals.

Calcium.—The method of Rathenau and Suter for production of metallic calcium upon a commercial scale, by electrolysis of the fused chloride, has already been described (*see* 4.971).

Up to 1921 no important uses had been found for calcium; consequently there was little demand and the price of the metal remained comparatively high. Before the war calcium was quoted in Germany at M.5.50 per kgm., equivalent to a price of 3s. to 3s. 9d. per pound. It could still be produced at this price, if a large demand for the metal were created.

The only application so far suggested for calcium is as an absorbent for the occluded and trapped gases in molten metals; and in this direction it comes into competition with the cheaper and lighter metal aluminium. Soddy, in a Royal Society paper of 1906, referred to the use of calcium for removing the last traces of O. and N. from rarefied gases, and stated that by its use very high vacua could be obtained, but no practical industrial application of this suggestion appears to have been made.

Calcium Carbide and Calcium Cyanamide.—The manufacture and application of these two products of the electric furnace have been described (*see* 1.138). Whereas the use of calcium carbide for generating acetylene for domestic or public lighting purposes is not extending, its manufacture and use as an absorbent for nitrogen increased rapidly after 1910. The cyanamide process, in fact, when operated in favourable localities, seems likely to remain one of the chief competitors of the Haber and electric-arc processes for the fixation of atmospheric nitrogen. According to reliable authorities, the relative power consumption for the three processes is as follows:—

Haber (taken as unity)	1
Cyanamide	8 to 10
Arc processes	25 " 30

Regarding power considerations alone, therefore, and ignoring technical questions, it is clear that the Haber process is of universal application—while the cyanamide process will only

advantage over the arc processes if its greater complexity can be counterbalanced by its greater efficiency. There is good evidence, however, for the belief that cyanamide costs have been very substantially reduced recently, and whereas in 1908 about 0·75 E.H.P.-year was required to produce a ton of cyanamide, the present energy consumption at Odda is believed not to exceed 0·6 E.H.P.-year per ton.

As regards the progress of the three processes, Landis has published the following comparative figures for the years 1913 and 1916:

Installed Capacity for Nitrogen Fixation Throughout the World in Short Tons of Fixed Nitrogen

	1913	*1916*
Cyanamide Process	65,590	209,510
Arc Processes	18,650	29,400
Synthetic Ammonia Processes	8,000	60,000
	92,240	298,910

Most of this increase was made in 1915, and 1,000,000 H.P. is now consumed in the three groups of processes.

Before the war, there were 16 calcium cyanamide factories in existence utilizing about 200,000 H.P. in the manufacture. Even at that time, however, the larger proportion of the calcium carbide manufactured was utilized in the cyanamide industry. According to official reports, Germany possessed in 1920 plant with an annual capacity of 600,000 tons of calcium cyanamide, equivalent to 120,000 tons of combined nitrogen. This plant was distributed among six firms, the largest works being that of the Mitteldeutsche Stickstoffwerke A. G. Piesteritz, with a tonnage of 175,000 per annum. Other large works for production of calcium carbide and cyanamide are located at Odda in Norway, where an annual output of 300,000 tons eventually will be realized; at Piano d'Orte in Italy, and at Niagara Falls, where the American Cyanamide Company is operating on the Canadian side of the Falls.

Copper.—The very remarkable growth of electrolytic methods in the copper industry is, of course, due to the presence of small amounts of silver, gold and other precious metals in the original copper ore. These "impurities" accumulate in the slime from the electrolytic vats, and in most cases the value of this mud more than covers the whole cost of the refining operations. In 1913, the last year for which reliable aggregate statistics were available in 1921, over 1,000,000 tons of copper were produced by the copper mines and smelters of the world; and of this total it is probable that from 70% to 80% had been electrolytically refined. In mere tonnage capacity and in the capital sunk in the industry, the electrolytic copper-refining industry, therefore, easily ranks first among electrometallurgical industries; for the refineries cover immense areas and many millions of pounds' worth of copper and precious metals are locked up in the vats during the refining process.

The greater number of the electrolytic refineries are located in the United States, because the States still produce between 50 and 60% of the world's output of copper. The largest refinery is that of the United Metals Selling Co. at Perth Amboy. At Port Kembla in New South Wales, a new refinery has been built to refine the metal produced by the Mt. Morgan and other copper-mining companies of the Australian continent; and a production of 44,000 tons per year had already been attained by 1921.

The improvements made in the electrolytic refining process since 1910 have been directed chiefly towards the reduction of refining costs; and the method of operation is so well established that the only improvements possible are those based upon the substitution of mechanical for hand labour. Travelling cranes, by aid of which the whole of the anodes can be charged and the cathodes removed at one operation, are now used in all up-to-date refineries; and casting machines are also employed for casting the anode plates from the blister copper which constitutes the raw material of the refining process.

Addicks, in a recently published article upon the design of copper refineries, discusses the size and capacity of the anode melting furnaces, and states that for smooth and safe operation there should be at least six furnaces (three for anodes and three for wirebar units), two of each set being in service and one out for repairs. The limit of size in the past has been the ability to charge, refine and cast the charge in 24 hours. With hand-charging and ladling, using the same men for both operations, 60,000 lb. is regarded as a large furnace. If a fresh set of men be used for charging, and as many ladlers employed as can be accommodated at the ladle door, 100,000 lb. can be reached. With hand-charging but mechanical ladling 300,000 lb. is possible; and with full mechanical charging and ladling 500,000 lb. is easily reached. A furnace casting a charge of 300,000 lb. or more, according to Addicks, may be considered, however, a thoroughly economical unit; but he is insistent that all the impurities possible should be eliminated at this stage of the process, for it is much more costly, in practice, to throw this burden upon the tank-house and silver refinery. It is also important, he states, to do all that is possible to facilitate uniformity of operating conditions. As a general rule, anodes of constant composition, a uniform current density and a single electrolyte should be used throughout the tank-house.

Graphite.—The production of artificial graphite by the Acheson process has grown into one of the most flourishing of the electro-metallurgical manufactures. The original Acheson patent which protected the process was dated 1896, and as the 17-year period allowed by American patent law had elapsed, the process after 1913 could be employed in all countries without payment of patent royalties. Consequently, there was a great expansion of the industry in countries where the demand for artificial graphite existed; and the manufacture is now carried on in the United Kingdom. The method described by Acheson in his original patent has undergone little alteration or modification in its general features, since it was first worked upon an industrial scale at Niagara Falls, in the year 1897.

The growth of the industry is shown by the following comparative figures of output at Niagara, for the two periods 1898–1900, and 1915–7 respectively:—

1898	185,647 lb.	1915	5,084,000 lb.
1899	405,870 "	1916	8,397,681 "
1900	860,750 "	1917	10,474,649 "

These totals do not include graphite used for electrodes, but only the artificial graphite which comes into competition with the natural variety.

The artificial graphite can be employed for any of the purposes for which natural graphite is used, with the exception of the manufacture of crucibles, and it is of interest to note that a recent American patent covers its application to this purpose also. The chief application of artificial graphite, however, is its use for electrodes, for which its high electrical conductivity renders it specially suitable. Its further advantages are that it can be produced in large blocks which can be sawed, tapped or screwed, and turned in the lathe to any desired shape. Some of the artificial graphite electrodes manufactured for electric furnace work have been of enormous size, namely 24 in. in diameter and 72 in. in length; and these could not possibly have been produced from natural graphite.

The production of artificial graphite was greatly stimulated during the war period by the increase in the number and capacity of the electric furnaces used for steel production and in the number of new installations of electrolytic cells for decomposition of brine; and there was a notable falling-off in the demand for these two purposes after the Armistice. In other directions, however, the use of artificial graphite has been growing, and of these applications the most notable are its use for the manufacture of lubricants, paints, dry-batteries, engine-gland packings, and boiler-scale preventives.

Electric Steel Furnaces.—Since 1910 a very remarkable increase has been seen in the number and capacity of electric furnaces, both for the purpose of refining the higher grades of steel and for the production of ferro-alloys, in the leading industrial and manufacturing countries of the world. This increase, no doubt, has been due very largely to war conditions. Every country, engaged in the struggle, was thrown upon its own resources with regard to the production of iron and steel; and as electric heating offered the quickest and most efficient method of converting ordinary carbon steel and scrap from the shell factories into the special steels required for the manufacture of shell billets, guns, armour plates, etc., etc., as well as for various other military purposes, electric furnaces were installed in all centres of the steel industry.

Descriptions have been given (*see* 14.824) of the Heroult arc furnace, and of the Kjellin and Rochling-Rodenhauser types of induction furnace. The latter type of furnace has not survived in the iron and steel industry, for the temperature attained in it has been too low to effect any useful refining work, and as a simple melting furnace for production of special alloy steels it is handicapped by the fact that some portion of the last charge of metal must always be left in the furnace ring to maintain the current. The Kjellin type of induction furnace as modified by Hiorth, however, is now used for the production of a specially pure iron for dynamo construction, the principle being to encase the whole secondary of

the furnace in a gas-tight ring. and to melt and cool the metal in vacuo. In this way all occluded gases are removed, and the magnetic permeability of the metal is greatly increased. With this exception the successful electric steel melting and refining furnaces are now all of the arc, or combined arc and resistance heating type. Detailed figures for all countries are not available, but the following comparative figures for the United Kingdom are striking. In the year 1912, only nine electric furnaces were operating, or in course of erection, in the iron and steel works or foundries of Great Britain; Messrs. Edgar Allen & Co. of the Imperial Steel Works, Sheffield, being the pioneers in the introduction of electric steel refining into Sheffield. Six years later, in October 1918, when the Armistice was declared, the number had grown to 123 (see Table III).

TABLE III.

Electric Steel Furnaces in Operation or in Course of Erection in the United Kingdom in November 1918

Type of furnace	No.	Average capacity tons	Average monthly output	Average current consumption
1. Heroult . . .	50	5	9595	992
2. Electrometals .	26	2½	3097	1031
3. Greaves-Etchells .	24	2	1109	1122
4. Stobie . . .	8	10	1010	880
5. Snyder . . .	6	1	918	787
6. Rennerfelt . .	5	1½	419	1495
7. Stassano . . .	2	2	136	1770
8. " Special " . .	2	1	204	769
	123	4	16,488	1105

The average monthly output of these 123 furnaces was 16,500 tons of steel, in the form of ingot-metal, special alloys and castings. Further particulars of the types of furnaces installed, with figures for the average monthly output and current consumption, are given in the table. It must be pointed out here, however, that the figures for the average current consumption of each type of furnace cannot be used as the index of their respective thermal or electrical efficiencies, since, in the absence of information concerning the physical state and the chemical composition of the charge, and the amount of refining work carried out in the furnace, average figures of current consumption cannot be considered a safe guide to relative furnace efficiencies.

The largest number of furnaces at the end of 1918 were installed at the East Hecla Works, Sheffield, of Messrs. Hadfields, Ltd. These works were equipped with 11 Heroult arc-furnaces chiefly of 6 to 7 tons, capacity. The largest furnaces erected in England were the 12- and 15-ton furnaces of the Stobie type at Dunston-on-Tyne, and at the Openshaw works of Armstrong Whitworth & Co.

As regards the lines along which progress occurred during 1911–20, the tendency in the United Kingdom was to increase the power of the transformers, rather than to follow the American plan of reducing costs by the erection of larger furnaces. When large tonnages of electrically refined steel have been required, it has been the custom to employ molten steel, which has been previously treated by the Bessemer or open-hearth process. This method of working is known technically as the " duplex " or " triplex " system, and it leads to a great reduction in the consumption of electric current per ton of metal refined. Three-phase current is also now generally employed for electric steel refining in place of single-phase current, since the use of three electrodes with the molten steel as the common neutral point of the system leads to much more uniform heating of the bath. As regards regulation of the load on the generators and transformers, the Thury system of automatic regulation of the arc gap is generally employed in the United Kingdom, and by an electrically operated device the total load of a battery of furnaces can be kept within any desired limits.

In the United States, for electric steel melting and refining, the tendency is to employ larger furnaces than in Great Britain, with improved mechanical equipment for charging and discharging the furnaces. Automatic apparatus for regulating the arc gap and power factor has also been coming into general use, the Thury system of current regulation being widely adopted. As regards electrode-holders and cooling-boxes, the tendency in American practice has been to substitute cast-steel holders and boxes for the bronze ones which have been hitherto used, since there is less risk of contamination of the charge with impurities, should there be a stoppage of the flow of cooling water and fusion of the metal. The mechanism for tilting the furnaces is also receiving attention: controllers of the reversing type now being employed with a motor brake to prevent " overtravel " of the furnace, and to hold it stationary in any position. The largest electric furnaces erected up to 1921 in America for steel melting and refining are the 25-ton Heroult three-phase arc-type furnaces at the South Chicago works of the Illinois Steel Company. In 1918 this company was stated to be producing electric steel at the rate of 16,500 tons per month, using the " triplex " system referred to above. The other types of electric furnace used in the American steel industry are:—Booth-Hall, Girod, Greaves-Etchells, Grönwall-Dixon, Ludlum, Snyder and Von Baur.

Ferro-Alloys.—Applications of ferro-alloys in the iron and steel industry have increased enormously since 1911, and in 1921 the Sheffield tool-steel trade was dependent for some of its most valuable products upon the ferro-alloys obtained by aid of electric heat. The discovery made many years earlier, that small percentages of chromium, nickel, manganese, vanadium and other rare metals, either separately or in combination, caused profound changes in the physical properties of steel, has in fact revolutionized modern steel manufacture; and the production of a rustless or " stainless " steel was one of the most notable advances of the war period. Molybdenum is the latest rare metal to be added to the list of those employed now in steel manufacture; and Prof. Arnold's molybdenum-vanadium steel was expected by some authorities in 1921 to have a great future.

The special steels are called binary, ternary or quaternary, according to the number of elements (other than impurities) which are present, and it is the quaternary steels, which contain carbon and two other elements, that are now finding the widest applications in the arts and industries. The ferro-alloys used in their manufacture have in the past been supplied chiefly from the large electrometallurgical works located in the French and Swiss Alps. The war showed, however, that dependence upon an overseas power for supplies of these essential raw materials for the steel industry was not a wise or safe arrangement. The production of ferro-alloys, therefore, was commenced in England at Widnes, Newcastle and other places, and has come to be regarded as a " key industry."

The furnaces used for the production of ferro-alloys are of the resistance type, and their design is based on that employed for the furnaces used in the manufacture of calcium carbide, but they have been modified considerably both in form and in other details of construction. The use of the electric arc for heating is not conducive to efficient working except in the steel and alloy refining processes, since the temperature required for reducing the ores lies between that of the ordinary metallurgical furnace and that produced by the electric arc. Furnaces working on the resistance principle have, therefore, been most successful in the manufacture of ferro-alloys, and arc furnaces are used only for refining. The ferro-alloys made in these furnaces in the early days of the manufacture were very impure, and the first ferro-chrome placed upon the market by a French firm contained from 7 to 9% carbon. Improvements in the design and method of working the furnaces, however, have led to the production of alloys containing a much lower percentage of this element; the percentage of carbon in some of the ferro-chrome now produced having been reduced to under two per cent. By treatment in a refining furnace this percentage can be still further reduced to under ·50%, or to any lower limit demanded by the steel-maker, but this of course adds considerably to the cost of the ferro-alloy. The use of pure raw materials, the avoidance of excessive heating of the charge, and the prevention of contact between the molten ferro-alloys and the electrodes or the walls of the containing vessel are the means by which this improvement in the purity of the product has been attained.

Electric Iron Smelting.—Electric heat for smelting iron ore is now employed at various centres in Sweden, Norway, Italy, Japan and Brazil, where the local conditions favour the use of electrically generated heat for this purpose. The furnace employed is an improved type of the shaft-furnace originally tried in the year 1911 at Domnarfvet and Trollhättan in Sweden, by the Swedish Iron and Steel Makers' Institute.

Magnesium and Magnesium Alloys.—Magnesium and its alloys have come to the front as metals of considerable industrial value and importance in recent years, owing to the demands of the aeroplane and motor industries for a light metal which will combine with this quality strength, toughness and ability to resist the effects of vibration and shock. The alloys of magnesium and aluminium which contain from 5 to 30% of Al have approximately the same mechanical properties as brass, and can be employed for the manufacture of screws, nuts, wire, tubes and sheets. The hardness of these Al Mg alloys increases with the proportion of the latter metal present in the alloy, and with 70% Mg the hardness is equal to that of mild steel. An alloy containing 92% Mg and 8% Al has been patented by a German firm, and is stated to have a strength equal to that of gun metal, with a specific gravity of only 1·75. If its claims are substantiated, the demand from aeroplane and motor-car manufacturers ought to result in manufacture on a large scale.

In the manufacture of the Mg Al alloys it is of great importance that the metals should be pure. The aluminium is first melted in a graphite crucible, and a small amount of cryolite is added as a flux. The magnesium in the required amount is then introduced and in

order to prevent loss by oxidation is held beneath the surface of the molten aluminium by tongs until it is melted. As regards the best contents of Mg for alloys designed for various uses, Klaudy states that a 2 to 5 % Mg alloy is best for wire-drawing; 5 to 8 % for rolling; 12 to 15 % for casting, and that the average strength of a cast 10 % Mg alloy is 20,000 lb. per sq. inch. An alloy he recommends for aeroplane construction work has the following composition:— Al 80 parts; Mg 12 parts; Cd 8 parts.

The Al Mg Cu alloys are stated to be useful for chemical work, as for example the alloy containing 96 % Al, 2 % Cu and 2 % Mg. This alloy is very dense, machines well, and has been used with success for the construction of a 3-in. flanged valve, designed for work with acetic acid.

As regards the methods of manufacture adopted for producing pure magnesium, it is known that before the war the Germans were manufacturing the metal by the electrolysis of fused "carnallite," a naturally occurring salt containing potassium and magnesium chlorides. The position at the commencement of the war was, therefore, that Germany had practically a monopoly of the manufacture of magnesium, and supplied the whole world with its requirements of the metal. It was only under the stress of war conditions that English and American manufacturers commenced to take an interest in this very interesting metal.

As regards America there were, in 1921, two plants at Niagara Falls producing magnesium, under the control of the American Magnesium Corporation, and there was also one at Rumford Falls, controlled by the Rumford Metal Co. The latter plant employed as raw material a pure magnesia obtained as by-product from some other process. The Dow Chemical Co. of Midland and the General Electric Co. of Schenectady are two other firms which produced magnesium in America during the war. Concerning the process of reduction or extraction used by the plants at Niagara Falls, very little information is available. There is no doubt, however, that the process used is an electrolytic one, and that the electrolysis takes place in a bath of fused chlorides with aluminium present when an alloy is desired. At Rumford Falls, where MgO is used as raw material, the method in fact is exactly similar to that used for the manufacture of aluminium.

Quartz-Glass and Fused Silica Ware.—This electric-furnace product has been manufactured since 1904 at Wallsend-on-Tyne by the Thermal Syndicate, and at Hanau in Germany by Heraeus. Quartz is an impure form of silicic acid (SiO_2); and quartz-glass is, therefore, a glass consisting chiefly of silicic acid, whereas ordinary glass contains silicic acid in combination with lime, soda, potash or lead. The great advantages of quartz-glass as compared with ordinary glass are that it has a much higher melting point and that it is not fractured by sudden changes of temperature. Other important properties are that it is neither hygroscopic nor soluble in acids, and that alkalies affect it less than ordinary glass except at the higher temperatures. It is, therefore, of great value for chemical and research work.

In the early days of the manufacture only tubes were made. The method of production was to embed a graphite rod in sand, and to heat this with a current of high amperage. A white opaque tube of quartz was obtained in this way, of much greater diameter than the graphite core. The opacity was due to the air entangled in the raw material, this air being imprisoned as minute air bubbles in the pasty mass when it softened under the application of heat. The latest method of overcoming this defect is to heat the fused tube a second time quickly up to 1800° C. by aid either of an oxyhydrogen flame or of the electric arc. The cellular structure then collapses, and a semi-translucent tube is obtained which is not only stronger but is a better conductor of heat than the original opaque tube. The highest grade of glass-sand and modern methods of blown-glass manufacture are now employed, with the aid of iron moulds similar in construction to those used for glass bottles, to produce any hollow kind of fused silica ware.

Sodium.—The Castner cell and process for the production of metallic sodium by the electrolysis of fused sodium hydrate has been generally adopted.

In a recent American patent, No. 1,334,179 of March 1920, and assigned to the Dow Chemical Co., A. W. Smith and W. R Veazey, of Cleveland, proposed to substitute a mixture of 35·6 parts of sodium chloride and 64·4 parts of sodium carbonate for the more expensive sodium hydrate. This mixture melts at 600° C. and yields a product equal in quality and purity to the present commercial sodium.

Tin.—The application of electrolytic or electrothermal methods in connexion with the tin industry has been confined to the recovery of the metal from tin scrap and from the old tin cans found in the refuse of all large towns. At one time the electrolytic recovery of tin from these two sources became a branch industry of some importance; but these electrolytic methods of treating tin-scrap metal and refuse had in many places been displaced by 1921 by newer methods, depending upon the use of liquid or gaseous chlorine. The electrolyte methods, however, continued to be carried on by some municipalities.

The alkaline process of electrolytic tin-stripping was patented first in the United Kingdom by an Englishman named Beatson; but the German firm, Th. Goldschmidt & Cie., of Essen, Germany, was the first to see and to turn to good account the possibilities of the process. This firm, by organizing the collection of the waste scrap in all countries and its transport on a large scale to their works at Essen, obtained at one time almost a monopoly of the raw material of the industry. The scrap, after cleaning and freeing from grease and fat, was employed as anode material in baths which contained a 10 % sodium-hydrate solution as electrolyte. Under the influence of the current the tin was dissolved as sodium stannate, and was deposited at the cathode as metallic tin, with reformation of the sodium hydrate. The chief chemical, therefore, was continuously regenerated, and the only drawback of the process was that the solution of the tin was not quite complete, and the iron-tin alloy, which existed on the plate under the coating of tin, was not dissolved by the sodium salt. The residual iron left in the vats still carried, therefore, measurable and variable amounts of tin, which diminished its value from the steel-melters' point of view.

At one time before the war, the alkali process of tin-stripping was being worked at seven different centres in Europe and at one or two in America, and over 40,000 tons of tin scrap was treated annually by the process. A plant which operated in Limehouse, London, was reported to be using the same process.

Electrolytic tin-stripping methods, which are based upon the use of ferric and stannic chlorides as solvent for the tin, have been patented and tried also upon a commercial scale. Their great advantage is that the solder and hard alloy of iron and tin, under the tin coating, is removed by the chloride treatment; and that only one-half the electric current required by the alkali process suffices to deposit the tin from the chloride electrolyte. The Bergsoe and Browne & Neil processes of tin-scrap treatment were the most notable examples of this method in the past. More recently, Walter and Lodge have patented the use of a stripping solution consisting of a 7 % solution of caustic soda or potash, with 1 % of stannous chloride, heated to 180° F. The scrap is placed in bags in a perforated revolving drum, which is rotated or oscillated within the vat, and is divided into longitudinal compartments by the cathode plates which project into it internally. The method is protected by British patents Nos. 122,025 and 122,618 of 1918, and is reported to have been operated in Birmingham.

Zinc.—The many different processes which had been patented or experimented with, up to the year 1910, for the electric deposition of zinc from sulphate or chloride solutions of the metal paved the way for the improved methods and processes of the later period, and there were in 1921 many large plants in operation in America and Australia, producing electrolytic zinc upon an industrial scale. Success depends upon freeing the electrolyte supplied to the depositing vats from all impurities more electro-negative than zinc—copper, cadmium, lead, antimony and arsenic. The presence of even very minute amounts of the two last-named impurities (arsenic and antimony) is found, in fact, to lead to low-current efficiencies. The non-recognition of this fact led to the failure of many of the electrolytic processes that were tried upon an industrial scale in the past. The other essential of success is to prevent "treeing" of the deposited zinc, since this leads to short-circuiting in the vats; and "treeing" has been overcome by stripping the cathodes every 48 hours, and by not attempting to form thick sheets of zinc.

The most modern and largest plant in which electrolytic zinc was being produced in 1921 was that erected in 1918 by the Anaconda Copper Co. at Great Falls, Mont., for recovery of the zinc from the complex zinc-lead ores of the Butte district, by a sulphate leaching process. The tank-house of this plant contains 864 vats, each 10 ft. long by 3 ft. wide by 5 ft. deep; and each vat will hold 28 anodes and 27 cathodes. The latter are of rolled sheet aluminium from which the deposited zinc can be stripped easily. The anodes are of chemical lead. The current for each unit of 144 cells is supplied by a rotary converter of 5,800 K.W. output, 10,000 amperes at 580 volts being required to run this number of cells. At full load the current density employed is 30 amp. per sq. ft. of cathode area, but 22 to 25 amp. yields the most satisfactory deposit.

Similar plants have been erected and operated at Park City, Utah, by the Judge Mining and Smelting Co. for treatment of the concentrates from a sulphide ore containing zinc, lead and silver; and at Trail, B.C., by the Consolidated Mining & Smelting Co. of Canada. This latter company claims to have been the first to put electrolytic slab zinc on the market at a cost which left a profit to the producer. The average composition produced at Trail, B.C., is Zn, 99·93 %; FeO, ·005 %; Pb, ·038 %; Cd, ·027 %.

Electrogalvanizing.—The electrolytic deposition of a coating of zinc, from sulphate solutions, upon iron articles is now a well-established industry in all the leading manufacturing countries.

ELGAR, SIR EDWARD (1857–), English composer (*see* 9.266), received the O.M. in 1911. His first symphony, produced at Manchester 1908, created a furore and was played upwards of 100 times in a twelvemonth. It was followed by the violin concerto; *Falstaff* (Leeds); the 2nd symphony in E flat; and all these by a wonderful series of compositions written during the World War. The *Spirit of England* (poems by Lawrence Binyon), *Carillons*, a pianoforte quintet, a string quartet in A minor and a 'cello concerto were produced between 1914 and 1920.

His wife, Caroline Alice Roberts, the daughter of Maj.-Gen. Sir Henry Roberts, whom he married in 1889, was herself an accomplished musician and linguist. She was the author of various poems, including *In Haven*, set to music by her husband in *Sea Pictures*. She died at Hampstead April 7 1920.

ELGIN, VICTOR ALEXANDER BRUCE, 9TH EARL OF (1849–1917), British statesman (*see* 9.268), died at Broomhall, Fife, Jan. 18 1917.

ELIOT, CHARLES WILLIAM (1834–), American educationist (*see* 9.274), was offered the post of ambassador to England by President Taft in 1909, but preferred to serve his country in a private capacity at home. The same position was tendered him in 1913 by President Wilson and again declined. He continued to take an active part, by writing and speaking, on all the important public questions of the day. His theories as to needed changes in education toward the concrete and practical had great influence upon American schools. The vocational movement, so marked after 1910, was without doubt accelerated by his continued insistence upon the training of the senses of sight, hearing and touch, as being the sources of the best part of knowledge. In 1914 he was elected president of the American Association for the Advancement of Science. In his educational writings he maintained that the traditional systems had dealt too exclusively with language and literature. In 1916, however, he was awarded a gold medal by the American Academy of Arts and Letters for his literary influence in his educational work. In the field of religion he was an authoritative spokesman on the Unitarian faith. In his later books, *The Religion of the Future* and *Twentieth Century Christianity*, he rejected obscure dogma, emphasized freedom in place of authority, and held that the teaching of Jesus had been "the undying root of all the best in human history since He lived," and that He would be the supreme teacher in the new religion, the outcome of which would be the brotherhood of man. Dr. Eliot gave much attention to labour problems and declared that "profit-sharing, combined with coöperative management, in which the employees take active and reasonable part, with coöperative care of health, education and happiness of employees, and with full knowledge by employees of the employers' account, is the only road to industrial peace." He condemned limited output by labour as well as uniform hours and wages. The settling of industrial strife he considered the next important thing after the establishment of a league of nations. He was a strong supporter of President Wilson's administration, and approved his personal appeal to the country in 1918 to return a Democratic Congress. He favoured prohibition as a war measure, and later as an amendment to the Constitution. He wrote in favour of military training after the Swiss method, but maintained that, after a league of nations was formed, no country should be allowed to have an army "whose officers have entered for life the profession of soldier." In 1920 he was an active worker for the Democratic party because he regarded the immediate adoption of the Covenant of the League of Nations as a moral obligation. He was the author of *The Conflict Between Individualism and Collectivism in a Democracy* (1910, lectures delivered at the university of Virginia); *Some Roads Towards Peace* (1914) and numerous articles on educational, religious, political and social questions.

ELLIOTT, HOWARD (1860–), American railway manager, was born in New York Dec. 6 1860. After graduating from the Lawrence Scientific School, Harvard (C.E. 1881), he was for several years a clerk in various offices of the Chicago, Burlington & Quincy railway. Later he was appointed general freight agent and then general manager of several lines belonging to the Burlington system. In 1902 he became second vice-president of the company and the following year president of the Northern Pacific. In 1913 he was made president of the New York, New Haven & Hartford railway and at the same time chairman of its board of directors. In 1917 he resigned and was made chairman of the committee on intercorporate relations of the New Haven system. The same year he was named by the American Railway Association as one of the six members of the Railroads War Board. He was again president of the Northern Pacific 1919–20, and then became chairman of its board of directors. He opposed the eight-hour law, urged higher freight rates, and suggested the creation of a department of transportation, with a secretary in the Cabinet.

ELLIS, ROBINSON (1834–1913), English scholar (*see* 9.294), died at Oxford Oct. 9 1913. Among his later publications were editions of the *Amores* of Ovid (1912) and the second book of Ovid's *Tristia* (1913).

ELWES, GERVASE CARY (1866–1921), English vocalist, son of Valentine Cary Elwes, of Billing Hall, Northants., and Brigg, Lincs., was born at Billing Nov. 15 1866. Educated at the Oratory school, Edgbaston, and at Christ Church, Oxford, Gervase Elwes married Lady Winefride Feilding, daughter of the 8th Earl of Denbigh, in 1889, and two years later, on appointment to the diplomatic service, he became honorary attaché at Munich, then at Vienna and finally at Brussels. Possessed of a charming tenor voice, he became known as an amateur singer of exceptional ability, and in the three cities named he studied music assiduously, in Vienna under Mandyczewski and in Brussels under Demest, while he also paid frequent visits to Paris from Brussels in order further to study under Bouhy. He entered the musical profession while still in the diplomatic service, which he finally abandoned in 1895. As a professional singer he made his first public appearance at the Westmorland Festival in 1903, and in London at a concert of the Handel Society. In London he continued his studies under Victor Beigel, sang with conspicuous success at the Monday "Pops," at the Kruse festival and at provincial festivals. His first representative festival engagement was at Leeds in 1904. In 1907 he toured Germany with Fanny Davies; two years later he sang with the Oratorio Society of New York in Bach's *St. Matthew Passion* and *The Dream of Gerontius*, the latter a work with which his name became indissolubly associated. He took part in upwards of 150 performances of it. His intensely deep religious convictions undoubtedly aided him in this work, for he was a very devout Catholic, and in Bach's *Passion* his performance was exalted. As singer of songs Elwes held an unique position. He excelled in the *lieder* of Brahms; and to him such English composers as Roger Quilter and Vaughan Williams owed a fair proportion of their success, at least in the beginning. Elwes left England late in 1920 for a long-promised tour of the United States, and he was accidentally killed at the railway station at Boston on Jan. 12 1921.

EMBRYOLOGY.—In the earlier article (*see* 9.314) the growth of the science of embryology was traced from the period of the Renaissance until the beginning of the 20th century. It remains here to deal with the more recent discoveries as to the nature and meaning of the developmental process.

The Cell.—We take for granted (*see* CYTOLOGY) a general acquaintance with the structure of the bodies of adult animals. It is now a matter of universal agreement to conceive the active

living parts of these bodies, which are included under the general name protoplasm, as built up of a series of units termed cells, each normally containing a single nucleus and separated from one another by quasi-solid membranes termed cell-walls.

The doubts as to the validity of the concept of the cell, which were raised in the later years of the 19th century, have not been sustained by later discoveries. A more refined technique has enabled us to demonstrate a cell-wall in cases where it was supposed to be absent; and where it really is absent, as for instance in the ectoderm of the Nematode worms, it has been proved that this is a secondary state of affairs, due to the degeneration of a well-developed layer of cells, which in younger stages of the life-history are clearly and sharply delimited from each other. It is true that in many, perhaps in most, cases the cell-walls are perforated so that adjacent cells are connected by bars of protoplasm, but this circumstance in no way invalidates the idea of the cell as the unit of structure.

Scope of Embryology.—The lowest grade of animals, termed the Protozoa, do not exhibit cellular structure. Either their bodies are so small that they possess only one nucleus, and in this case they may be regarded as free-living cells; or they contain more than one nucleus and attain a greater size, and then their protoplasm is not divided into compartments in accordance with the distribution of these nuclei.

Some of the largest of the Protozoa such as the extinct genus *Nummulites* were disc-like in form and attained a size of an inch in diameter; the bodies of these animals were divided into thousands of compartments by calcareous septa. To judge from what we know of the structure of their nearest living representatives they must have possessed numerous nuclei; but these nuclei were not distributed in accordance with the divisions of the protoplasm. Some compartments contained several nuclei, some one nucleus only and many none; so that true all-structure was absent.

In other cases the protozoön may be described as a colony of small uninucleate forms, connected together either by strings of protoplasm or by stalks springing from a common base. But all these more complex Protozoa are distinguished from the true higher animals or Metazoa by the fact that when reproduction takes place the whole body of the parent breaks up into germs, each containing a single nucleus, whereas in true Metazoa small portions only of the parent's body are set aside for reproductive purposes; in other words, in the Metazoa there is a persistent "soma" or body distinct from the germ-cells. Now of course the development of the Protozoa ought to form part of the subject matter of embryology, but in the case of the smaller species it is exceedingly difficult to say which stage corresponds to the adult condition of Metazoa, since reproduction by the division of the mother's body into two, can take place at various periods in the life-cycle, and therefore purely as a matter of convenience it is customary to confine the subject matter of embryology to the study of the life histories of the higher animals which exhibit definite cellular structure, in a word to the Metazoa.

Metazoa.—If we now examine the development of the Metazoa we find a few cases where, side by side with other methods, reproduction by *fission*, that is by the division of the mother's body, does actually take place.

Thus in the marine annelid *Procerastes* described by Allen[1] the mother worm breaks up into groups of one, two or three segments and each of these groups regenerates the missing parts and thus constitutes a new worm. In much more numerous cases an outgrowth of the mother's body, termed a "bud," is produced. The bud consists from the beginning of several tissues, and is slowly moulded into the likeness of the parent and when fully grown separates from it, or in the case of a colonial animal remains connected with it and helps to build up a compound organism. Such compound creatures are found amongst the sponges, the Coelenterata, the Polyzoa, and the Ascidians, the last-named group being degenerate allies of the Vertebrata.

The laws of bud-development have not been as clearly elucidated as those of the germ-cells. Development by germ-cells is universal amongst the Metazoa; and in all but two phyla the form in which they appear is remarkably constant. They are of two kinds, viz. male and female, and are normally incapable of development unless they have previously united in pairs to form what are called "zygotes" (Gr. ζύγον, a yoke).

The male cell or spermatozoön consists of a head which is a condensed nucleus made up of a compact mass of chromatin, and a tail which is a vibratile filament. Amongst the nematode worms, however, the male cells are devoid of filaments and appear under the form of small amoeboid cells, whilst amongst the higher Crustacea (*i.e.* the shrimps, lobsters and crabs) the tail is replaced by a peculiar vesicle, which under certain circumstances absorbs water and explodes, thus propelling the head forwards and in this way bringing about the union of the two germ-cells.

The Germ-cells.—The female cell or ovum (egg) is typically rounded and motionless but it is of very different sizes in different species of animals. These differences in size depend entirely on the varying amounts of food-yolk—*i.e.* reserve material—deposited in the cytoplasm; that is to say, in the extra-nuclear protoplasm. The food-yolk in turn differs in amount according to the extent to which the young organism must grow before it can obtain nourishment for itself. Thus the human egg is only about ·1 mm. in diameter since at a very early period of its development it becomes attached to the wall of the womb and subsequently draws all its nourishment from that source. The egg of the ostrich on the contrary is one of the largest known, being about 15 cm. in diameter, since it has to provide all the food necessary to build up a good-sized chick.

Eggs which have a very small amount of yolk and in which this is evenly distributed throughout the cytoplasm are termed "alecithal"; such are the eggs of Hydrozoa, Echinodermata, Brachiopoda and of Amphioxus and Mammalia amongst Vertebrata. Eggs in which the yolk is concentrated at one pole of the egg are termed "telolecithal"; this pole is termed the "vegetative pole," whilst the opposite pole where the bulk of the cytoplasm is concentrated and where the polar bodies (see below) are given off is termed the "animal pole." The eggs of most Annelida and Mollusca and of Pisces, Amphibia, Reptilia and Aves amongst Vertebrata are telolecithal. Eggs in which the yolk is massed in the central part of the egg and is surrounded by a layer of cytoplasm almost free from yolk are termed "centrolecithal." To this class belong the eggs of nearly all Arthropoda.

Both types of germ-cell before attaining maturity undergo two ripening (*maturation*) divisions, so that in each case four daughter cells are produced. Whereas in the case of the male germ-cell all four daughters become fully formed *spermatozoa*, in the case of the female germ-cell only one daughter is converted into the ripe egg; the remaining three are small vestigial cells destined to perish, which are termed the "polar bodies." During the maturation divisions the number of chromosomes in the nuclei of both male and female germ-cells is reduced by one-half (for details of this process *see* CYTOLOGY). When the spermatozoön enters the egg, the head, which is a condensed nucleus, swells up and assumes the ordinary nuclear structure and is termed the "male pronucleus"; behind it is situated a very active centrosome (*see* CYTOLOGY) which produces a series of radiating rays termed the "spermaster." The nucleus of the ripe egg is termed the "female pronucleus." The male pronucleus approaches the female pronucleus, and the spermaster constitutes the groundwork of the first mitotic spindle by becoming divided into two asters connected with one another by longitudinal fibres; this spindle initiates the development of the egg by bringing about the first division of the combined male and female pronuclei and of the fertilized egg (zygote) itself. The tail of the spermatozoon is either left outside when the head penetrates the egg, or if it penetrates the cytoplasm it degenerates there; its remnants can sometimes be detected in one cell of the embryo, up till the stage of 32 cells has been attained, but it takes no part in cell-division and no portion of it is transmitted to any other cell, the conclusion being that it plays no part in the transmission of hereditary qualities.

The nucleus of the zygote, as we have just seen, has double the number of chromosomes which are present in the nucleus of the ripe egg but half of these are of male origin. Every nucleus of the developing embryo therefore inherits from the zygote nucleus an equal number of male and female chromosomes, so that the body of the embryo has with justice been likened to a tissue of which the warp is paternal and the woof maternal.

Parthenogenesis.—In the earlier article it was pointed out that the unfertilized egg could be induced to develop by a variety of agencies varying from the addition of a small quantity of butyric acid to the sea-water in which it is placed, followed by exposure to the action of hypertonic (*i.e.* over-salted) sea-water in the case of echinoderm eggs, to the prick of a pin in the case of the eggs of Amphibia. This is termed *artificial parthenogenesis.*

In the case of the eggs of the sea-urchin (*Echinus*) parthenogenesis has been minutely studied by Loeb[2] who has put forward various theories as to the action of the agents which he employed. He imagined that the action of the butyric acid was to start cytolysis, one result of which was the formation of a definite egg membrane, but which if unchecked destroyed the egg, which became resolved into a mass of globules. The exposure to hypertonic sea-water was supposed to arrest this injurious action. This explanation was obviously not applicable to the parthenogenesis of the frog's egg.

[1] E. J. Allen, "An Autotomy and Regeneration in the syllid worm Procerastes." *Proc. Roy. Soc. Lond.*, Series B, vol. xcii., 1921.

[2] J. Loeb. Numerous papers summarized in his book *Die chemische Entwicklung des tierischen Eies* (1909).

The whole subject has been attacked from a new point of view by Herlant[1] and Brachet[2] who have pointed out that the agent employed to provoke parthenogenesis does not exercise a specific chemical action on the egg but merely acts as a stimulus to which the egg as a living organism responds. Whether butyric acid or a needle be employed the response is the same; the egg "wakes up" so to speak, the nucleus emits something which acts as a centrosome and from this is developed a great series of radiating rays traversing the cytoplasm, a huge "monaster" in fact. The chromatin of the nucleus becomes resolved into chromosomes which are split longitudinally and which become adherent to the rays of the "monaster." In the case of the egg of the sea-urchin it is only extremely rarely that the monaster becomes changed into an ordinary mitotic spindle by the division of the centrosome. In most cases after persisting for about an hour the monaster disappears; the nucleus returns to the resting condition and then after a short interval it passes through the same phases, a monaster being again formed. After this process has been repeated about six times over a period lasting twelve hours the egg dies and cytolysis supervenes. If, however, after the egg has been exposed to the action of the butyric acid and then washed in sea-water it is placed in hypertonic sea-water, and then after a limited period of immersion in this fluid replaced in ordinary sea-water, additional asters are formed in the cytoplasm. When the egg forms a monaster this becomes connected with these other asters by longitudinal fibres so as to form a complex spindle. By properly choosing the period of immersion in hypertonic water it is possible to arrange that only one additional aster should be formed; this then joins with the monaster to form a normal mitotic spindle on to which the egg chromosomes migrate; a regular division of the nucleus follows and thereafter a division of the whole egg into two cells and so parthenogenetic development is initiated.

The course of events in the frog's egg is fundamentally similar to the process which we have just described, although there are differences in detail. A prick with a sterilized needle induces the formation of a huge monaster, which then divides into two forming a short mitotic spindle on to which the chromosomes of the egg migrate. Since, however, the length of the spindle stands in relation to the number of chromosomes in the nucleus and as these chromosomes are only present in half the number found in the nucleus of the fertilized egg, the spindle which is formed is only four-fifths of the length of the first spindle formed in the fertilized egg. The length of spindle in turn determines the length of the actual rays from its poles, and if these are too short to reach the periphery of the egg the spindle is unable to bring about the division of the egg into two cells. This is the case with the spindle formed in the parthenogenetic egg, and although abortive and transitory furrows on the egg's surface are formed no division into cells results; the nucleus, it is true, divides and a multiplication of nuclei follows in which the numerous short spindles formed interfere with one another and make orderly development impossible and so after a short time the egg dies.

If, however, the needle be "infected" by being dipped into frog's blood before being used to prick the egg, then the foreign substance thus introduced produces additional asters in the cytoplasm just as did the hypertonic water in the sea-urchin's egg. These asters have a tendency, as their rays develop, to repel one another, and they push the mitotic spindle developed around the egg nucleus over to the one side. *If this side happens to be the side of the egg at which the cytoplasm is concentrated*, then the spindle is able to start the formation of a furrow which cuts right through the egg and divides it into two cells, and so parthenogenetic development is begun. We see then that the difficulty of initiating parthenogenesis depends on two factors, viz. (1) the quiescent condition of the egg and (2) the small amount of chromatin present in the nucleus. If we choose the unripe eggs of the sea-urchin as the subjects of our experiment then it is sometimes possible to induce them to develop by the use of one reagent alone, such as hypertonic sea-water; since in these eggs the "reducing" division of the nucleus has not occurred (*see* CYTOLOGY) and the chromatin is consequently present in undiminished quantity.

Parthenogenetic development is closely related to the problem of heterogeneous fertilization. It has been shown that under certain circumstances it is possible to fertilize the eggs of the sea-urchin with the sperm of creatures so diverse in zoölogical affinity as the annelid worm (*Chaetopterus*) and the sea-mussel (*Mytilus*). In the first case the male and female pronuclei fuse but the male chromatin falls out of the zygote nucleus before the first division takes place. In the second case the male pronucleus refuses to enter into union with the female pronucleus at all, but the sperm-aster brings about the division of the egg. When the eggs of the sea-urchin (*Echinus*) are fertilized with the sperm of the heart-urchin (*Echinocardium*), in the vast majority of cases cytolysis results exactly as it does after the exposure of the echinus eggs to the action of butyric acid, but in some few cases the egg develops and produces a hybrid. We conclude that in most cases the sperm of *Echinocardium* is so alien to the cytoplasm of the egg of *Echinus* that it is not even able to bring about the formation of a spermaster.

Under certain circumstances (slight staleness of the egg, excess of sperm, etc.) more than one spermatozoon may enter the egg. In large eggs such as those of cephalopoda, reptiles and birds this seems to be a normal occurrence; only one of these nuclei unites with the female pronucleus and forms the zygote nucleus from which begins the cell-division which initiates development; but the other spermatozoa also form centres for cell-division which gives rise to the so-called free cells which are characteristic of these eggs. These free cells are gradually crushed out and destroyed by the developing cells produced by the activity of the zygote nucleus.

Brachet, however, has shown[3] that when the frog's egg is entered by spermatozoa in moderate numbers, whereas only one fuses with the female pronucleus, the others form centres for the formation of cells which are built up into the body of the embryo. As these sperm-heads, however, contain only half the quantity of chromatin contained in the zygote nucleus, the cells to which they give rise are markedly smaller than those which contain nuclei descended from the zygote nucleus, and so it is possible to distinguish in the growing tadpole the regions which contain cells which have nuclei derived from the zygote nucleus from those which contain cells having nuclei derived from the supernumerary spermatozoa.

Brachet's observations prove in the clearest manner that the differentiation of organs in the frog's egg is due to the differentiation of regions in the cytoplasm and not to the differentiation of the nuclei produced by the division of the zygote nucleus as Weismann[4] had supposed, for some of these nuclei can be replaced by sperm-nuclei each of which carries in it the potentiality of producing the whole organism—not a mere region of it—and yet no dislocation of development results.

The entry of two or more spermatozoa into small eggs such as those of the sea-urchin usually produces abnormal development followed by early death. The reason is that the centrosomes which are carried into the egg by these spermatozoa are so near each other that instead of leading to the formation of separate spindles they give rise to three- (triaster) or four-poled (tetraster) spindles along which the chromosomes are arranged in an irregular manner. This causes the formation of abnormal nuclei incapable of properly fulfilling their functions and the embryo dies.

Development of the Egg.—If we now turn to consider the normal development of the egg we find that this can be divided into three stages which in primitive forms are sharply delimited, but which in more modified forms tend to overlap one another. These stages are (1) segmentation, or the division of the egg into a number of indifferent cells or blastomeres; (2) the formation of the so-called germ layers, *i.e.* the differentiation of the blastomeres into the primitive organs—viz: (*a*) the ectoderm (or epiblast) which is the primitive skin, (*b*) the endoderm (or hypoblast) which is the primitive lining of the gut, and (*c*) the mesoderm (or mesoblast) which is the primitive peritoneum or lining of the body-cavity; (3) organogeny, *i.e.* the formation of the separate organs of the body, such as brain, liver, kidneys, etc., from the germ-layers.

Segmentation of the Egg.—Considering first the process of segmentation, we find, as Balfour[5] pointed out long ago, that the effect of the accumulation of yolk in the egg is to impede cell-division. It acts exactly as if it were a dilutant of the cytoplasm in lowering surface tension. Cell-division is accompanied by a great increase in surface tension as is obvious from the way each daughter cell rounds itself off from its sister. This is particularly evident in the segmentation of alecithal eggs, for in them, in the early stages of segmentation, all the blastomeres divide simultaneously, and just after each period of division these take on the appearance of a pile of balls only touching each other in points; whereas during the interval between two such periods the surface tension diminishes and the blastomeres become flattened out against each other.

In all alecithal and telolecithal eggs there is a pole (see above) from which the polar bodies are given off which is termed the animal pole of the egg. This pole is the region of the egg which contains least yolk; here cell-division is most rapid and the smallest blastomeres are produced, whereas as we pass towards the vegetative pole of the egg, where the yolk is concentrated, the blastomeres become fewer and larger.

[5] F. M. Balfour, *Treatise on Comparative Embryology*, vol i., p. 95.

When the yolk is very much increased in amount, the nuclei produced by the division of the zygote nucleus are unable to bring about a surface tension sufficient to divide the cytoplasm, and so we get a multiplication of nuclei without the formation of blastomeres. When this happens segmentation is confined to the animal pole of the egg and results in the formation of a thin disc of blastomeres termed the "blastoderm," resting on an unsegmented "yolk." Such eggs (for instance the hen's egg) are termed "meroblastic" (gr. μέρος, a part) in contradistinction to eggs, like those of the frog, which are completely divided and are termed "holoblastic."

In centrolecithal eggs, like those of the crayfish, the egg appears to be completely divided into cells, but although division may at first be complete, the lowered surface tension of the inner yolky ends of the blastomeres is unable to keep them apart and they flow together so as to form a common inner yolky mass. Such eggs are said to exhibit *superficial segmentation*. Later, the outer protoplasmic ends of these incomplete blastomeres become completely cut off, so as to form a skin of cells of blastoderm surrounding a central "yolk." A still further modification of this type is found in the eggs of insects in which the yolk is so abundant as to prevent all segmentation. The zygote nucleus alone divides and gives rise to daughter nuclei each surrounded by an island of protoplasm; these are at first dispersed throughout the "yolk" but they gradually migrate to the surface and here form a blastoderm.

In primitive alecithal eggs segmentation results in the formation of a hollow ball of cells one layer thick. This ball is termed the "blastula" and its cavity the "blastocoele," "segmentation-cavity" or "primary body-cavity." The formation of the blastula marks the accomplishment of an important step in development. Although typically formed only in alecithal eggs, it appears in a modified form in telolecithal eggs, even in those in which there is so much yolk that they have meroblastic segmentation. Thus in the case of the frog the blastula is a hollow ball of which the roof is two cells thick and the floor is many cells thick, whilst in the case of the pigeon the blastula is represented by a stage in which the blastoderm is one layer thick and forms the roof and is separated by a slit-like cavity from the immense mass of the unsegmented yolk forming the floor in the uppermost layer of which are a few nuclei. These nuclei are representatives of the cells which should constitute the vegetative pole of the blastula but they are utterly unable to cut the yolk up into cells.

Formation of Germ Layers.—As soon as the blastula stage has been attained, the "formation of layers" begins. The cells at the vegetative pole become turned inwards, forming a tube-like structure which projects into the blastocoele and partially obliterates it. This tube is the primitive gut or "archenteron" and the cells forming it are termed "endoderm," whereas the cells forming the outer wall of the blastula give rise to the primitive skin and are termed "ectoderm." Driesch[1] has shown that until the archenteron begins to be formed all the cells of the blastula of Echinus are alike in their potencies; any sufficiently large piece of it, if cut off, will round itself off and form a blastula and ultimately a perfect larva of diminished size; after a region has been delimited as the centre of the formation of the endoderm the rest of the blastula wall, if cut off, can no longer form an archenteron and so it follows that when the endoderm is differentiated at one place, the rest of the blastular wall becomes changed into definitive ectoderm.

When the archenteron has been formed the developing egg has assumed the shape of a double-walled cup, the opening into which is termed the "blastopore." This stage is clearly and sharply marked in the development of almost all eggs in which the yolk is small in amount, and it can be recognized in an obscured and altered form in the development of large yolky eggs. It is of equal importance to the blastula stage, and it is termed the "gastrula."

The primary body-cavity has now become reduced to the slit intervening between the wall of the archenteron and the outer wall of the gastrula and this slit becomes largely filled up by the development of the third germ layer, the "mesoderm." We have defined this layer as the primitive peritoneum or lining of the body-cavity, but the body-cavity now indicated is termed the "coelom" or "secondary body-cavity" in order to distinguish it from the primary body-cavity. In the eggs of primitive animals, where the yolk is small in amount, the coelom is always formed as a series of pouch-like outgrowths of the archenteron which become cut off from this tube. It follows that the mesoderm is differentiated from the primary endoderm. Driesch[2] has shown that if the front half of the gastrula of the starfish which includes the apex of the archenteron be cut off, the hinder half will heal up and will form a perfect larva, forming, of course, the coelom in the normal way. If, however, this operation be performed after a swelling of the tip of the archenteron—the first rudiment of the coelom—has appeared, then, although the hinder half will heal up and form a larva, it never forms a coelom. Driesch concludes from this experiment that at first all parts of the archenteric wall have the power of giving rise to a coelom, that is of forming mesoderm, but that later a definite portion of this wall becomes set aside as the rudiment of the coelom and that then the rest of it becomes the definitive endoderm devoid of this coelom-forming power. In Echinodermata the coelom arises as a single pouch from the apex of the archenteron; in primitive Vertebrata it originates as five pouches of which one is apical and four are paired and lateral; in Chaetognatha and Brachiopoda as a lateral pair of pouches. The remnant of the primary body-cavity becomes almost filled up with cells budded from the wall of the coelom which are termed "mesenchyme." These cells may become joined to one another by their processes and thus constitute a network which becomes converted into connective tissue by the secretion of fibres; or they may remain separate from one another, and then they become developed into blood and lymph cells, the remnants of the primary body-cavity constituting the blood-spaces. In the Coelenterata, in which no coelom is formed, similar cells are budded from both ectoderm and endoderm; in Annelida and Mollusca, in addition to the mesenchyme given off from the coelomic wall, some is likewise budded from the ectoderm, and to this the name "mesectoderm" has been given. In Vertebrata the most recent research indicates that no mesenchyme is given off from the ectoderm.

Organogeny.—Turning now to the third stage of development, viz. the formation of special organs, we find that from the ectoderm are derived the central nervous system and the sense organs, and also the lining of the mouth-cavity and of the terminal portion of the alimentary canal near the anus. The endoderm gives rise to the middle portion of the gut and to the glands which are developed from it, and in Vertebrata to the primitive elastic axis of the back-bone or "notochord." From the mesoderm arise the majority of the muscles, the connective tissue, and, in Vertebrata and Echinodermata, the internal calcareous skeleton which is derived from the connective tissue. The mesoderm also gives rise to the genital organs and their ducts in all Metazoa above the rank of Coelenterata and in Mollusca and Vertebrata to the kidney tubules.

Now we have pointed out that, in telolecithal eggs, segmentation proceeds most rapidly at the animal pole; here the second stage of development rapidly supervenes, and the archenteron is begun before segmentation is even initiated at the vegetative pole. In meroblastic eggs the upper pole of the egg may become converted into an embryo in which all the important organs of the adult are mapped out before the lower pole is even invested with cells. Finally in Amniota (reptiles, birds, and mammals) the lower pole of the egg, after all the yolk has been absorbed from it, is torn from the rest of the embryo at birth and cast off as a useless embryonic membrane.

In the earlier article a strong attempt was made to show that the primitive germ-layers do not correspond to one another in different eggs; in a word, that the same name has been given to different things.

Some of the arguments adduced are the diverse origins of the mesoderm in various animals, and the alleged origin of the epithelium of the alimentary canal of insects and some other Arthropoda from the ectoderm. The result of the labours of embryologists during the last 15 years has been to establish the universal homology of the germ-layers on an ever firmer basis, and to show that the difficulties alluded to were based on faulty observations.

If, for instance, we define the mesoderm as the wall of the coelom then it is found that this organ originates in one of two ways, viz.: either as a pouch or a mass of cells. The pouch (recognizable in Chaetognatha, Brachiopoda, Echinodermata, Enteropneusta and the lowest Vertebrata) quite clearly originates as an outgrowth from the endoderm; the mass of cells can be traced back to its source in one large cell, the mother mesoderm-cell. This cell, as was first shown by Shearer[3] in the annelid *Hydroides* and by Conklin[4] in the mollusc *Crepidula*, originally forms part of the wall of the archenteron and its ejection from this wall is evidently a modification of the more primitive method of coelom-formation by the outgrowth of a gut-pouch. Attempts which have been made by Meissenheimer[5] and Harms[6] to show that in Mollusca the coelom originates from cells budded from the ectoderm are based on obvious blunders in missing out stages in reconstructing the life-history—that most fertile source of error in embryology. Later workers have exposed this error and have shown that in the Mollusca, with which Meissenheimer and Harms dealt, the mother mesoderm cell gives rise to the pericardium which is representative of the coelom in these animals. We have already alluded to the presence of mesectoderm in Annelida and Mollusca; this gives rise to some superficial muscles, but to confound this with the coelomic wall and its derivatives by calling both mesoderm and then to complain that the mesoderm is not an homologous structure in various groups of animals is to introduce a perfectly gratuitous confusion.

We may now turn to the alleged origin of the gut epithelium of certain Arthropoda from the ectoderm. In the earlier article the statement was made that in the embryo of that most primitive of all land Arthropoda *Peripatus* there is a large slit-like blastopore which later

becomes divided by a constriction into mouth and anus, and that a portion of the gut epithelium, viz. that forming the midventral portion, is formed from ectoderm turned in round the edges of the slit. It is practically certain that this last statement also rests on an error of observation. In the primitive annelid *Polygordius*, Woltereck[1] has described a similar slit-like blastopore and he has followed the process of its closure in great detail describing the division of every cell involved. In this case the midventral epithelium of the gut is formed by the union of *endoderm* cells lying at the sides of the blastopore—whilst the ectoderm cells lying in the blastopore lips by their union reconstitute the midventral skin. No reasonable doubt can be entertained that a renewed investigation with a more modern technique would show that this is also true of *Peripatus*.

It must never be forgotten that embryological research is based on a comparison of embryos of different ages with one another—not, as would be the ideal method, on a continuous observation of the *progress* of one and the same embryo. It follows that too large an *age-difference* between the embryos examined may give rise to a totally wrong conception of the process which is taking place. So are to be explained the statements which crop up from time to time, such as those of Heymons[2] that the mid-gut of the higher insects is entirely formed from ectoderm, and of Watase[3] who made a similar assertion about the mid-gut of the cephalopod *Loligo*. Hirschler[4] has shown how the error of Heymons originated, and Watase has been corrected by Faussek[5]; and should further statements of this kind occur in the literature the strong presumption is that they also are founded on mistakes.

Organ-forming Substances.—We have arrived at the conclusion that the establishment of the validity of the germ-layer theory is one of the great achievements of embryological research, and we now turn to the question of how the differences which distinguish the layers from one another are brought about. We have learnt that in primitive alecithal eggs like those of Echinodermata all portions of the blastula wall are alike in their potencies and that the differentiation of ectoderm from endoderm only begins when the first traces of gut-formation are visible. We have likewise learnt that all parts of the primitive gut or archenteron are alike in their powers, and that the separation of endoderm from mesoderm only becomes apparent when the first indication of the coelom appears. But this progressive differentiation of the embryo might be due to a differentiation of the nuclei of various regions or of the cytoplasm or of both. We have, however, learnt from the development of the polyspermic frog's egg that there is a strong presumption that the nuclei of the embryo are alike in their nature and that the differentiation of the layers must be due to the separation of organ-forming cytoplasmic substances from one another. This conclusion is confirmed by a large number of observations on many different kinds of eggs; a few of the more striking may be given here.

Hertwig[6] allowed frogs' eggs to develop under pressure between glass plates and in capillary tubes. Under these circumstances the divisions took place by planes normal to the pressure and flat plates and rows of cells were produced. When the pressure was removed, however, these deformed embryos recovered, multiplication of cells took place and the normal form was regained and normal development proceeded. It was easy to show that nuclei which under undisturbed conditions would have occupied certain definite regions of the embryo had been forced into quite other regions, and yet perfectly normal embryos resulted. Hertwig concludes that the nuclei could be juggled about like a handful of balls without affecting the formation of the embryo.

In many eggs the differentiation of the layers is indicated at a far earlier period than that at which it occurs in the eggs of the Echinodermata or even of the lower Vertebrata like the frog. The egg of the ascidian *Cynthia partita* which has been studied in great detail by Conklin[7] may be adduced as an example. This egg when it develops becomes converted into an elongated blastula consisting of few cells; this blastula changes into a gastrula in the typical way, and though no distinct coelomic pouches are formed large portions of the archenteric wall are directly converted into muscles which lie at the sides of the tail of the tadpole-like larva. In this species the nucleus of the unripe egg is as usual a vesicle filled with fluid (the so-called germinal vesicle). The cytoplasm contains numerous yolk globules of a slaty-blue colour and also larger yellowish globules which are concentrated in its superficial layer. When the maturation divisions of the nucleus occur the nuclear wall is dissolved and the fluid contents escape and form a cap of clear material at the animal pole of the egg. When fertilization takes place profound rearrangements of the substances in the cytoplasm are effected. The yellow globules stream downwards to meet the spermatozoön which enters at the vegetative pole, and they finally form a crescentic layer of yellow material round the lower pole of the egg. As the egg develops first into a blastula and then into a gastrula, and finally into the characteristic ascidian tadpole, it becomes evident that the clear substance forms the ectoderm, the slaty-blue material the endoderm, whilst the yellow material forms the masses of mesoderm which give rise to the tail muscles. When the egg is in the four-cell stage the yellow material is confined to the two posterior cells; if one of these be killed the remainder of the egg will give rise to a larva with muscles only on one side of the tail. That the nuclei have nothing to do with this separation of substances is shown by what occurs at the lip of the blastopore. Here we find an arc of what Conklin calls "neurochordal" cells. Each of these has of course a single nucleus, but the cytoplasm of each consists of two zones, one clear and one slaty-blue. At the next division two daughter cells are produced from each neurochordal cell; one of these contains the clear substance and is added to the nerve plate which is a part of the ectoderm; the other is composed of the blue substance and forms part of the notochord which in *Cynthia* as in other Vertebrata is a derivative of the endoderm.

From this development we conclude that *the germinal layers owe their origin to the segregation of cytoplasmic substances in the growing egg*; that these substances assume their final arrangement under the influence of the spermatozoön, which thus on its path to meet the female pronucleus *determines the symmetry of the embryo*. Brachet[8] has shown that this is also true of the frog's egg. It was for long a puzzle why competent observers like Roux[9] and Hertwig[10] should differ so profoundly on the results of killing one of the first two blastomeres of the frog's egg. Roux asserted that the surviving blastomere gave rise to a half blastula which developed into a half tadpole, whilst Hertwig maintained that it tended to form a normal tadpole, being only impeded in its development by the mass of dead material constituted by the other blastomere. Brachet has shown that both are right, for the plane separating the first two blastomeres need not by any means coincide with the future median plane of the embryo, but may make any angle up to a right angle with it. If it coincides with this plane by killing one blastomere Roux's result is obtained; if it is oblique the result accords with Hertwig's researches.

Thus the potency of each of the first two blastomeres of the frog's egg depends entirely on the cytoplasm it happens to include and in no way on the nucleus. Brachet[11] has shown that the fixing of the median plane of symmetry in the frog's tadpole, as in the ascidian tadpole, is effected by the spermatozoön. As the spermatozoon penetrates the egg in its path towards the female pronucleus, it leaves behind a trail of pigment which persists for a considerable time and can be detected at a much later period in the development of the egg. It is found that on the opposite surface of the egg to that at which the spermatozoon enters it, there is formed the so-called "grey crescent." This is in reality the upper lip of the blastopore; it is here that the differentiation of ectoderm from endoderm begins. Therefore we conclude that the arrangement of the organ-forming substances in the frog's egg is caused by the spermatozoön.

In the mollusc Dentalium when the egg has reached the four-cell stage one of the blastomeres emits a protuberance termed the "yolk-lobe" or "polar lobe." This lobe is devoid of a nucleus and before the attainment of the eight-cell stage is reabsorbed into the blastomere. Nevertheless, if this lobe be cut off, the remainder of the egg develops into a larva which is fatally devoid of mesoderm.

That the materials which form the basis of the different substances embodied in the germinal layers are formed in the growing egg under the influence of emissions from the nucleus is rendered certain first by the close relationship of the nucleus to assimilation and secondly by the fact (*see* CYTOLOGY) that the nucleolus of the unripe egg breaks up into fragments and is extruded into the cytoplasm. It is, however, a surprising fact that the nuclei of the segmenting egg are alike and apparently without influence on the differentiation of the primary organs. In fertilization a second nucleus of alien origin is introduced and portions of this nucleus, as we have already seen, are

[11] Brachet, *loc. cit.*

incorporated in all these "segmentation" nuclei. Now it is common knowledge that the influence of the father is as potent as that of the mother in heredity and therefore there must arrive a period of development at which the nuclei again influence the cytoplasm.

An attempt to determine this period was made by the writer[1] by fertilizing the eggs of *Echinocardium* with the sperm of *Echinus*. As we have seen, the result of this cross is in most cases to produce cytolysis of the egg, but in a minority of cases a hybrid develops.

The egg of *Echinocardium* is oval whereas that of *Echinus* is spherical and the shape of the blastula of each species follows that of the egg. The blastula of the hybrid is oval, like the maternal blastula, and the gastrula is also like that of *Echinocardium*. But the typical larva (the four-armed echinopluteus) resembles in several points the larva of *Echinus;* in the vast majority of cases it is totally devoid of a large aboral club supported by a special skeleton which is characteristic of the larva of *Echinocardium*. It is clear therefore that at this stage the paternal nucleus is influencing the structure of the organism. When the eggs of *Echinus* are fertilized with sperm of a still more divergent character, such as that of the crinoid *Antedon*, a hybrid occasionally develops as far as the gastrula stage, but it always resembles the larva developed from the normally fertilized egg in every detail and shows no trace of paternal influence.

Nuclei and Cytoplasm.—We are thus led to the conception of an intermittent action of the nuclei on the cytoplasm, and in this it seems as if we had reached the deepest point to which analysis of development will lead us. Perhaps it would be more accurate to speak of an intermittent reaction between cytoplasm and nucleus, for in some embryos there is evidence that the nuclei undergo alteration as development proceeds. It is on cases like these that Weismann's[2] theory of development was founded. According to this theory, as growth proceeds, differential division of the nuclei takes place, some becoming specialized as ectodermal nuclei, others as endodermal nuclei and so on, whilst some retain the constitution of the original zygote nucleus; these last give rise by division to others like themselves which eventually engender the nuclei of the germ cells. The lineage or line of descent leading from these germ-cell nuclei back to their ancestors amongst the nuclei of the first blastomeres is termed the "germ-track." Now in the Nematode worm *Ascaris megalocephala* the zygote nucleus contains only four chromosomes, but as the egg divides into blastomeres, the nucleus of one blastomere after another undergoes the change termed *diminution of the chromatin*. This change involves the nipping-off of the ends of the chromosomes, and these portions are ejected into the cytoplasm and are absorbed; the remainder of each chromosome becomes fragmented into a large number of minute granules. These granules act as chromosomes in the next nuclear division. The nucleus of one blastomere remains exempt from this change and this blastomere eventually gives rise to the genital organs.

Boveri[3] has shown that the fact that one nucleus undergoes diminution of the chromatin whilst another does not is not the consequence of a differential division of the mother nucleus of them both, but is due to the fact that one nucleus takes up its position in a region occupied by a particular cytoplasmic substance. This he proves in two ways, viz. (1) by considering the case of eggs fertilized by two spermatozoa, and (2) by the results obtained by subjecting eggs about to segment to the action of strong centrifugal force.

In doubly fertilized eggs the extra spermatozoön forms an independent nucleus whilst the other fuses with the female pronucleus to form the zygote nucleus. The first division of the egg results in the formation of four nuclei and four blastomeres. In the development of the normally fertilized egg one of the two first nuclei undergoes diminution, and the cell containing it gives rise to a large part of the dorsal ectoderm; the other nucleus remains undiminished and amongst the progeny of the cell containing it are found the genital cells. Now amongst the four cells produced by the division of the doubly fertilized egg, three may contain nuclei which undergo diminution, and one may remain undiminished—in such cases the egg develops into a single embryo with an unusually abundant ectoderm. In other cases only two of the nuclei undergo diminution—such eggs form twin embryos of normal aspect; whereas in still other cases one nucleus alone may undergo diminution and in these cases a monstrous triple embryo is formed. These differences are accounted for on the assumption that one region of the egg contains a substance which induces diminution and one, two or three nuclei of the doubly fertilized egg may be in it.

When eggs about to segment are exposed to the action of long-continued and intense centrifugal force the plane separating the first two blastomeres will in some cases be found to lie along a radius of the circle of rotation, and in these cases a small mass of material will be found to be ejected from the egg which then becomes divided into two appreciably equal and similar blastomeres, the nucleus of neither of which undergoes reduction. This suppression of reduction must be attributed to the even distribution of the cytoplasmic materials under the stress of the centrifugal force, so that no region of the egg contains more of the peculiar substance than any other. Diminution of the chromatin apparently results from the action of an excess of this substance on any nucleus contained in it.

Regeneration.—In the phenomena of regeneration and of budding we meet with evidence of the renewed influence of the nuclei in causing the formation of cytoplasmic substances.

We have already learnt that when one of the first two blastomeres into which a frog's egg divides is killed the survivor frequently develops into a half gastrula which may even grow into a half tadpole. Roux,[4] however, has shown that if this half tadpole survives it becomes a whole tadpole by what he calls the "post-generation" of the missing half. This is effected by the multiplication of the cells lying at the edges of the half embryo. The nuclei increase in number and confer on the cytoplasm in their neighbourhood new powers. In this case it might be objected that each kind of tissue in the old half gives origin only to the same kind of tissue in the new half. But Morgan[5] has shown that if the head (including the pharynx) of the annelid *Nereis* be cut off, a new head with pharynx will be regenerated from the stump; whereas, however, the original pharynx was formed by an intucking of ectoderm, the new pharynx is formed by an outgrowth from the endodermal tube in the stump. The new powers thus conferred on the cytoplasm of the endodermal gut can only be explained as the result of the calling-forth of new potentialities in the nuclei lying in the cut edge. More remarkable evidence still has cropped up in connexion with the regeneration of the lens of the eye of the newt. In the embryo the lens is formed as a thickening of the ectoderm on the side of the head. But if the original lens be torn out, a new lens is developed either from the edge of the iris or of the retina—tissues that have no connexion with the skin of the head. Some try to meet this difficulty by the phrase that in these cases the organism acts as a whole, independently of the germ-layers into which we analyse it. But what meaning can be attached to this phrase, except that the organism under different circumstances uses different means in order to effect a restoration of its integrity, it would be difficult to say. In fact we approach very closely to the celebrated "entelechy"[6] of Driesch; that is an indwelling "something" in an organism which strives to realize a purpose.

Vitalism, and the Theory of an Entelechy.—It may be argued that such an idea is unscientific, because it introduces "vital force" and similar mystical ideas amongst our biological conceptions. It may be answered that in the last resort *all explanation is comparison*, and that those who reject vitalism seek to compare all the activities of living beings to phenomena which go on outside the body in test-tubes. But this is equivalent to referring all the phenomena of life to structure, in other words the juxtaposition of definite chemical substances in a definite spatial arrangement; in regeneration, however, we encounter phenomena where structure appears to be irrelevant. If we are to do justice to such phenomena we must have some working hypothesis similar to that of Driesch. Whether the assumption of an "entelechy" is better or worse than the statement that all the nuclei in the body are totipotent and that varying potentialities are called forth seems to be a matter of taste.

Budding.—Regeneration is in many respects akin to budding, since buds in many cases may be regarded as portions of the mother organism restored after natural amputations.

In the growth of buds we often meet with a wide divergence between the materials used to build up certain organs, and those used to construct similar organs in the embryo. To give an example—the bud of the ascidian *Botryllus* begins its existence as a little two-layered vesicle very similar to the gastrula of the same species. But in the embryo the central nervous system is developed from the outer layer as it is in all other Vertebrata. In the bud, on the contrary, it is formed as an outgrowth from the inner layer. Hjort,[7] who described this phenomenon, suggested as the explanation for it the fact that the outer layer of the bud is an outgrowth of the adult maternal ectoderm, which is specialized for the secretion of the cellulose "mantle" and not sufficiently plastic to be turned into nervous tissue. This is only another way of saying that the formative nuclei act differently in different cases and distribute the organ-forming cytoplasmic substances in a different manner in the bud from their arrangement in the egg.

One or Two Embryos.—The primary organs, *i.e.* the germ-layers, are the material out of which the higher organs are built up, and one of the most remarkable of recent discoveries in embryology is the fact that the question of whether this material

shall be used to build up one embryo or two depends on the special relations which these primary cytoplasmic substances sustain to one another.

If the eggs of a frog be placed dry on the surface of a slide with their animal poles uppermost and fertilized in that position by the addition of small quantities of the fluid extracted from the seminal vesicles of a male; if then another slide be placed on top of them and the two slides clamped together by rubber bands; if when the eggs have divided into two blastomeres the whole preparation be inverted and left in water in a shallow dish for five or six days tadpoles with two heads or two tails will be developed. The materials in the unsegmented egg are of different specific gravities; the first furrow often (see above) divides them into two symmetrical halves; when the two-cell stage is inverted they tend to rearrange themselves in *each cell* in the same manner as they would have in the whole egg had it been inverted. Nothing has been added or taken away, yet the altered position of the materials in each cell has led to the formation of two organs where normally only one would have been formed. In the case of the newt's egg a similar procedure leads to the formation of two complete embryos, whilst if the blastula of the newt be constricted longitudinally by a hair a two-headed monster is formed. When a lizard's tail is broken off, if the little regenerating bud which forms at the wounded surface be indented the animal will regenerate two tails instead of one.

Internal Environment.—When the higher organs begin to develop we can in many cases prove that the whole course of their growth is governed by what may be called their internal environment, *i.e.* by influences emitted by other organs.

This may be clearly seen in the development of the common sea-urchin *Echinus miliaris*. The "echinopluteus" larva of this species is a transparent bilaterally symmetrical free swimming creature. It is provided with a complete alimentary canal consisting of oesophagus, stomach and rectum, and at the sides of the oesophagus are situated two flattened coelomic sacs. As development proceeds each sac becomes divided into anterior and posterior portions, and the latter move backwards so as to be pressed against the stomach. Still later from the posterior end of the left anterior sac a little bud termed the "hydrocoele" grows out. This is the rudiment of the water vascular system of tubes in the adult. The ectoderm lying over this bud becomes depressed so as to form a sac (the "amniotic cavity") from the floor of which grow up the spines which will cover the test of the future sea-urchin.

The hydrocoele bud overlaps the front end of the left posterior sac, and from this part of the sac there grow out five pockets from which will be developed the dental apparatus—the so-called "Aristotle's lantern." From the outer wall of the right posterior coelomic sac cells are given off from which are developed a pair of "pedicellariae" (pincer-organs) which will be situated on the upper surface of the future urchin. If we now allow [1] the young larvae at the time the coelom is being formed to grow in hypertonic water, then many of them will develop from the right anterior coelom a second hydrocoele bud. If this bud develops—and it does so if plentiful nourishment be supplied to the larva—then a right amniotic cavity is formed from the overlying ectoderm, whilst the right posterior coelom gives rise to a second Aristotle's lantern. If the development of the second hydrocoele bud be slow then one or even two pedicellariae may be formed on the right side as in normal larvae, but if it be rapid the formation of pedicellariae may be inhibited altogether. If after the bud has appeared the larva is nearly starved for a time, both this abnormal bud and the normal hydrocoele may remain small and undeveloped and then pedicellariae may be formed on the left side as well as on the right.

We conclude from these facts that the hydrocoele bud tends to inhibit the formation of pedicellariae on its own side of the larva but to cause their production on the opposite side, and we see further that the right hydrocoele bud can totally alter the development of the right side of the larva, forcing the right ectoderm to form an amniotic cavity and the right posterior coelom a dental apparatus.

Another still more striking case of the influence of the internal environment is afforded by the results of experiments performed on the tadpole of the frog.[2] The vertebrate eye consists of two main parts, viz.: (*a*) the retina, formed as an outgrowth from the brain; and (*b*) the lens, formed as a thickening of the ectoderm of the side of the head. If before the lens is formed the skin of the head of a tadpole be slit open and the retina cut off from the brain and pushed back till it occupies a position in the region of the shoulder or even farther back, and the slit in the skin sewn up, then the tadpole will recover; the cut-off retina will continue to live and grow in its new position, and it will force the ectoderm covering it to form a lens—although never in the history of the race has a lens been normally formed in this position. Numerous other similar instances could be adduced—did our space permit of it—suggesting the conclusion that in many embryos ***the primary organs are indifferent material and that the manner in which the secondary organs will develop out of them is fundamentally a matter of their spatial relations.***

External Environment.—We now approach the subject of the possible influence of the external environment on the course of development. In the earlier article the attention of the reader was called to the fact that development presents itself under two principal aspects, viz. the embryonic and the larval. In the embryonic phase the young organism is sheltered from the external world, either within an egg-shell or in the mother's womb, whereas in the larval phase it leads a free life, using its larval organs to seek its own food and escape its enemies.

It was further pointed out that if we compare two nearly allied animals such as *Salamandra atra* and *Salamandra maculosa*, in the first of which development is mainly embryonic whereas in the second it is largely larval, we arrive at the conclusion that the embryonic phase is secondarily derived from the larval phase, since the organs such as gills which are functionless in the embryo are functional in the larva. It was also pointed out that larval organs frequently resemble the adult organs of other animals of simpler and more primitive structure.

On these facts was founded the celebrated biogenetic law first enunciated by Haeckel[3] which affirms that "the embryo in its development recapitulates the ancestral history of the race." It is the law which provides a large part of the fascination of embryological research, but it was vigorously attacked in the earlier article and an effort was then made to show that it is not valid, since it was maintained that whilst it is true that larvae retain ancestral characters, the same is true of adults, and that larvae in their structure are not more reminiscent of the former history of the race than are adults.

Now the outcome of recent investigation has in large measure tended to reinstate the doctrine of recapitulation in its former position of preëminence, to show in fact that recapitulation forms the central thread in every life history, although it has been blurred and deflected by secondary influences, as indeed all believers in the biogenetic law have from the first admitted.

The first point to which we wish to direct the reader's attention is that larval and embryonic phases occur in all life histories. Every animal begins its existence as an egg which is quite incapable of feeding or of defending itself and this egg is always protected by an egg-shell although this shell may be very thin, and no animal upon leaving its early shelter and beginning to seek its own food attains at once the structure of the sexually ripe adult. Hence every animal in the course of its development may be said to pass first through an embryonic and then through a larval phase, although the latter phase may be very short and the difference in structure between the larva and the adult inconsiderable. Now, the larval phase being the later is the most recent addition to the life history and therefore the least likely to be modified by secondary factors; if therefore the biogenetic law be valid, it is the larval phase which will possess most ancestral significance. But in the earlier article attention is called to the fact that the identification of a larva as the representative of an ancestor must always be hypothetical because we have no direct knowledge of what the ancestor of any living animal was like. It behooves us therefore to look a little more closely at the reasons which actually do induce us to regard a given stage as ancestral.

First, it has been claimed quite recently that direct experimental proof of the validity of the biogenetic law has been obtained. Kammerer[4] placed young specimens of *Salamandra maculosa* which had just completed their metamorphosis in cages the floors and walls of which were coloured differently in different cases. The larva of this species has a skin of a uniform dark-greyish tint, but the skin of the adult is gaily coloured with bright yellow patches on a black background. The salamanders which were confined in cages having a floor of moist yellow loam and walls coloured yellow became yellower as they grew to maturity—a process which occupies between three and four years. The yellow patches, in a word, increased in number and size and tended to become joined together in bands. Those confined in cages with blackened walls and a floor of black garden earth became darker since the yellow patches dwindled in size. When the salamanders had attained sexual maturity and were allowed to pair, it was found that the offspring of two which had been reared in yellow surroundings, if they continued to live in the

same environment, became still yellower than their parents until the black pigment had been almost entirely displaced; whilst the offspring of two which had become darker, if reared in cages with black walls and floor, became practically completely black by the time they reached maturity so that they came to resemble the mountain species *Salamandra atra*. If, however, the offspring of two salamanders reared in yellow surroundings were allowed to grow up under black surroundings, they nevertheless *for the first six months of their lives became progressively yellower;* then and only then did the influence of the black environment begin to tell—the yellow patches became invaded by numerous small black spots and grew smaller. In short, the young recapitulated the process of "yellowing" that their parents had undergone.

If these results are confirmed the doctrine of recapitulation will change its status from that of an hypothesis to that of a proved fact; and further proof will be furnished that changes acquired by the individual in response to the demands of the environment are to a certain extent at least inherited.

The Recapitulation Theory.—Once we have grasped the mutual relationship of the embryonic and larval phases of development, indirect proofs of the reality of recapitulation begin to crowd in on us. If we find, for instance, one or two aberrant forms in an order or even a family the majority of whose members have a uniform type of structure, no reasonable doubt can exist that the ancestors of these aberrant forms had the typical structure of the group. If this conclusion be admitted and we find that the younger stages of the aberrant species also show the typical structure, does any one seriously question that these young forms recapitulate the history of the race? Two very striking instances of this kind have come to light within the group Ctenophora.

The typical Ctenophora are ovoid organisms of a glassy transparence which swim in a vertical position in the sea. Their locomotor organs are eight vertical rows of vibratile combs, each comb consisting of a short horizontal row of powerful cilia fused together at their bases. A certain creeping organism resembling a flat worm, named *Coeloplana*, had been believed by some zoölogists to exhibit ctenophore affinities but its relationships were very obscure. Quite recently a Japanese zoologist[1] has described its development. Its larva is a small typical ctenophore with eight rows of perfectly formed combs; these it discards after swimming for a few hours—it sinks to the bottom and flattens out and gradually assumes the adult structure. Another extraordinary organism, named by its discoverer Tjalfjellia,[2] was discovered amongst dredgings collected in the Arctic Ocean. This creature superficially resembled a sponge or an ascidian. It was gelatinous and sessile and seemed to consist of a pair of upright tubes like towers whence proceeded smaller tubes which ramified in its substance. In pockets connected with these smaller tubes were discovered groups of the larvae. These were small ovoid creatures of typical ctenophore structure with the eight vertical rows of combs.

If recapitulation of ancestral history forms an unquestionable element in the life history of some animals, is it not probable that it constitutes a factor in all life histories? To this question it seems to us only an affirmative answer is conceivable.

Change of Habits.—If we then regard the reality of recapitulation as proven we may now reflect on its meaning. We have seen that the recapitulatory element is most obvious in the latest larval stage of development, the most recently added page of the life history. Now the organs of the larva are adapted to its environment; therefore this environment in its broad outlines at least must represent the ancestral environment of the race.

The present condition of the race both as regards structure and habits has been produced as a consequence of migration from the original haunts of the race. Change of habits therefore reveals itself as the great driving-force in evolution, and change in habits usually means the choice of a different type of food.

We may conclude that the period of life at which this change most frequently occurred was when the adult organs had developed but before sexual maturity had been attained—in a word, at the stage of what we may call the young adult. As one change of habits succeeds to another in the course of evolution, the life history is not lengthened in the same proportion, since the new phase takes the place of the sexual phase in the previous condition of the race. In some Crustacea, *e.g.* in the shrimp *Penaeus*, at least four larval stages are passed through before the adult stage is attained, but in the majority of life histories when a new phase is added there is a tendency for some of the older phases to be pushed back into the embryonic period, so that as an animal passes from stage to stage in evolution it leaves behind a trail of stages at first larval and then becoming embryonic.

Secondary Modifying Factors.—We may now glance at the principal factors which modify and tend to obscure the recapitulatory factor. It is only possible to define these factors by a truly comparative embryology based on a wide survey.

One of these factors is "tachygenesis" or precocious development; that is to say, we find that organs originally developed as a response to the stimulus of a new environment come in course of time to be developed before the habits to which they correspond can be exercised—in fact *acquired habits tend to become innate*. Thus the young hermit crab when adult thrusts its abdomen into the cavity of a spirally coiled gastropod shell, and in this way imposes a twisted form on this part of its body. But if all such shells be removed from the hermit crab's neighbourhood at the time of its metamorphosis, it will still develop a curved abdomen although the extent of the curvature will be less than that which occurs normally. When the tadpole of the frog acquires limbs, these do not develop in the form of fins from which they have been undoubtedly evolved, but grow directly into the ordinary type of five-toed limbs, although weeks must elapse after their form is fully defined before they can function as the limbs of land animals. The tendency to hurry on development may be compared to the increasing facility with which a difficult operation is performed after long practice, but this tendency obviously tends to obscure the distinctive features of early development.

A second powerful modifying factor is the change from the larval to the embryonic phase, so far as the development of a particular organ is concerned. This change of phase is sometimes caused by an unfavourable alteration in the environment of the larva. It was actually effected artificially in the development of *Salamandra maculosa* by Kammerer.[3] This species is viviparous and normally gives birth to between 30 and 40 young which are provided with gill-slits and long gills and which live in the water for six weeks before they metamorphose into land animals. If the parents are exposed to successively colder and drier conditions, the number of young produced at a birth diminishes with each breeding-period, and these young are born at a progressively more advanced stage of development. If these young are reared to maturity under similar conditions of coolness and dryness, they will in turn give birth to young which will be still fewer in number than those produced by their parents and which are born at a still more advanced stage of development. The process goes on till only three or four are born at one time and these are provided with the merest stumps of gills; such young never enter the water at all but at once take up the adult mode of life. This is the normal mode of development of *Salamandra atra*.

The change of phase from the larval to the embryonic type entails many other changes. The embryo must be fed and it obtains its food from one of three sources, (*a*) devouring its sisters; (*b*) secretions from the mother's womb; (*c*) inclusions of yolk in its own cytoplasm. When the embryo devours its own sisters, this, as in the case of *Salamandra atra*, may entail little change of structure because the habit is one recently acquired; but where, as in the case of the play-helminth worms, the habit is of old standing then the embryo may be distorted out of all recognition. In these worms one viable egg is shut up in a capsule along with thousands of small sterile ones; and it is difficult to find in the embryo any vestige of resemblance to the larva of these Playhelminthes which lay their eggs singly.

When the embryo derives its nourishment from the mother's womb then it frequently develops organs of adhesion to the wall of this. To this category belongs the placenta which profoundly distorts the ventral surface of the human embryo, so that this surface gives rise to a treelike outgrowth whilst the dorsal surface is moulded into a ludicrously exact copy of the early tadpole of the amphibian.

When the embryo is fed by yolk, this, as we have already pointed out, modifies all the processes of development; cell division becomes slow and the cells produced few and large, and folding which plays a large part in the development of small alecithal eggs becomes impossible and is replaced by solid outgrowths of cells.

Still a third factor which tends to hide the recapitulatory element is the development of special larval adaptations. This occurs when the larva retains its free life but when its circumstances become changed. These special adaptations have been developed in thousands of insect larvae. So generally is this the case that Balfour[4] denied to these larvae any ancestral significance at all; but modern research has succeeded in revealing the original ancestral larval type beneath the secondary modifications.

All the evidence at our disposal points to the conclusion that the ancestors of insects were creeping myriapod forms—scavengers

which fed on the debris of both animal and vegetable nature in the undergrowth of primeval forests. Such is in fact the life of the lowest insects known to-day, some of which, such as *Machilis*, nourish themselves on the decaying sea-weed on the sea-shore, and retain throughout life vestigial limbs attached to the abdominal segments which aid them in their crawling movements. Now the myriapod or polypod larva survives as the caterpillar of the Lepidoptera and the primitive Hymenoptera. It is also found amongst the primitive Neuroptera and amongst the may-flies (*Ephemeroptera*). These last-named insects were supposed to possess a larva showing great secondary modifications, for it is provided with leaf-like gills attached to its abdominal segments; but Heymons[1] has shown that these gills are nothing but modified abdominal legs. It is a curious fact that amongst the lower insects, such as the cockroach, this polypod stage is passed through during the embryonic phase of development. The reason for this change is that these insects lay their eggs in situations where a grub-like larva would perish, whereas the higher insects, in which the stage is larval, are gifted with instincts which lead them to lay their eggs in situations where an abundance of easily procured and easily masticated food is available and a scavenging existence like that of the ancestor is possible.

A fourth factor which modifies development, and which is potent in its effect although it is usually overlooked, is *loss of size in the larva as compared with the ancestor which it represents.* As conditions change and the larval life becomes more dangerous there arises a tendency in which we may trace the influence of tachygenesis to pass quickly through the larval stage and to metamorphose at as early a period of growth as possible into the adult condition. A consequence of this change is that the larva assumes a new relation to its environment, for many qualities of the surrounding medium, such as the viscosity and supporting-power of water, acquire an altered importance as the organism decreases in size. If the ancestral organs were reduced in the same scale as is the whole body of the larva, this would in many cases result in their becoming incapable of being used. As a consequence we find that in many cases where the ancestor had a series of organs, this series is represented in the larva by fewer members or only one member of larger relative size, and that where in the ancestor there was a pair of organs there is frequently only one in the larva, but this is on a larger scale than the rest of the body. If we now select a few examples to illustrate this principle, we may consider the free-swimming larva of that most primitive of all vertebrates *Amphioxus.* This larva has only a single series of gill-slits which are so enlarged as to occupy the whole ventral surface of the body. If the double series of slits, which the ancestor in common with all other fish possessed, had been developed in the larva, they would necessarily have been of such minute size that the capillarity of the water would have prevented them from being functional. Similarly there is no doubt that the eyes of vertebrates were from the beginning paired structures, but they are represented in the ascidian tadpole by a cup-like outgrowth of one side of the brain. Again no serious doubt can be entertained that the primitive arthropod was evolved from a long many-segmented annelid with flexible parapodia. But the most primitive larval form of the Crustacea is the nauplius which is a little, oval, unsegmented creature with but three pairs of legs. The existence of this larva was a great stumbling-block to the earlier embryologists. It seemed to indicate that the Crustacea must have been derived from an unsegmented animal totally distinct from the ancestor of other Arthropoda, for the progenitor of these must have been long and segmented since the embryos of all these Arthropoda have many segments. But if we look at the nauplius larva from the standpoint of function rather than of structure we have no difficulty in seeing in it the recapitulation of the first step in the "arthropodization" of the annelid. This step was a change of habits which consisted in using the foremost parapodia as oars to propel the animal and as organs to seize food. As a consequence in the front of the body the cuticle was thickened and the "arthropodous" type of limb produced, whilst in the rest of the body the annelid condition of affairs persisted as indeed it may be almost said to do in the posterior portions of the bodies of this most primitive of Crustacea, the long-bodied Phyllopoda such as *Artemia.* Once begun in front, this "arthropodous" modification was gradually propagated backwards so as to involve the hinder segments of the body and in this way the higher Crustacea were evolved. In the nauplius larva, the anterior arthropodized portion of the ancestor with its appendages is alone represented; the hinder annelid portion in which function was less intense and less important is not developed.

One last instance of the principle may be adduced which we select from the embryology of the higher vertebrates. In the development of those types of Vertebrata in the life history of which there is a long larval phase (Cyclostomata, dipnoan, "ganoid" and teleostean fish, Amphibia), a larval excretory organ termed the *pronephros* makes its appearance. Its duct later becomes the duct of the permanent kidney, but the pronephros itself consists of very few tubules and these originate from the wall of the general body cavity and not, as do the tubules of the permanent kidney, from special sacs (the malpighian capsules). The earlier workers regarded the pronephros as a last trace of a primeval excretory organ of quite different structure to the permanent kidney by which it is later superseded. The works of Hatta[2] on the development of the lamprey and of Kerr[3] on the development of the Polypterus have proved that the pronephros is nothing more than the foremost section of the permanent kidney, early called into action and enlarged whilst the hinder section of the metamerically repeated series of tubes of which the kidney consists remains undeveloped. These investigators have further proved that the portion of the general body cavity from which the pronephric tubules arise consists of several malpighian capsules fused together and secondarily communicating with the general body cavity.

Life History of Animals.—It might be supposed that with so many modifying factors at work it would be a hopeless task to attempt to disentangle the recapitulatory element from them, and that therefore the ancestral history of animals except in its latest and least modified chapters would remain a closed book. But when we recollect that the life history of every species constitutes a separate edition of this history, and that the modifying factors have affected no two of them to the same extent, it becomes evident that comparative embryology built on a broad basis can attack the problem with a fair prospect of success.

Bearing in mind the priority of the larval over the embryonic phase, and beginning therefore our survey with the larvae of the simplest metazoa, we are able to recognize the first step in the evolution of the metazoön from the protozoa in the blastula, the hollow ball of cells which may be regarded as representing a colonial protozoön like the living *Volvox.* This stage was followed by the formation of a gut by the intucking of one side of the ball; and this second step is represented in the life histories of all the lower and simpler animals by the gastrula stage. Following on this stage came the formation of the coelom as a series of pouch-like outgrowths of the gut, and the change of the single opening of the gastrula, the blastopore, into two openings which became the mouth and the anus by the constriction of its middle portion.

It has been possible to show that two groups so utterly diverse in appearance as the Annelida and the Mollusca have originated from a single group of free-swimming ancestors represented by the trochophore larva, and since Arthropoda are admitted by all to be descended from Annelida this conclusion involves the ancestry of four-fifths of the animal kingdom.

We can form a very plausible guess as to the nature of the divergence of habits which led to the differentiation of the Annelida and Mollusca from one another. The original stock was free-swimming but both groups derived from it are typically bottom-dwellers. Two modes of seeking their food were open to them; they could either glide over the bottom by means of their cilia as young Gastropoda and Lamelli branchiata still do, or they could burrow into it. The first led to the evolution of Mollusca, the second to that of Annelida.

Two other groups of very diverse structure, which embryology has given strong reasons for believing to have been derived from a single race, are the Echinodermata and the Vertebrata. The lowest form which gives distinct evidence of the vertebrate affinities is the worm-like creature *Balanoglossus.* The larval form of *Balanoglossus* is a free-swimming organism called *tornaria* which shows the closest resemblance to the typical larva of Echinodermata, the *dipleurula.* The recognition of this affinity has assisted in the elucidation of a difficult subject to which considerable space was devoted in the 11th ed., viz. the origin of the central nervous system.

It is characteristic of the most primitive Annelida and Arthropoda that this system develops as a ring round the blastopore and an endeavour was made in the 11th ed. to prove that this was originally true of vertebrate embryos also. But it is a peculiarity of the vertebrate-echinoderm alliance which is still unexplained that in them the blastopore gives rise to the anus alone, whilst the mouth is formed as an apparently independent perforation at a considerably later period of development. A long succession of embryologists, with their eyes fixed only on the embryos of Annelida, Arthropoda and the higher vertebrates, have held that the vertebrate mouth is a new structure formed by the fusion of a pair of gill-slits and have prosecuted vain searches for traces of the old mouth. Others have imagined that the mid-dorsal line of the vertebrate embryo along which the nerve-cord develops corresponds to the line joining mouth and anus in the arthropod, the line in fact which is occupied by the slit-like blastopore in *Peripatus.* They hold that the nervous system of the vertebrate originally extended round the front end of

[3] Kerr, "Vertebrata with the exception of Mammals," *Textbook of Embryology,* vol. i., pp. 223–237 (1919).

the embryo so as to include the mouth. But the independent and late development of the mouth is as marked a feature in the echinoderm larva as in the vertebrate embryo and there are no gill pouches in the echinoderm on which we could fall back to explain the phenomenon. Further, in the adult echinoderm the whole of the ectoderm is underlain by a nervous plexus of which the central nervous system is only a specialized and intensified portion, and the same thing is true of the anterior region of *Balanoglossus*. It is therefore futile to look for exact correspondence between the central nervous systems of two stocks which diverged from one another at such a primitive level as did the Vertebrata and the Annelida. In fact the descendants of the trochophore stock (Annelida, Arthropoda and Mollusca) on the one hand and the original Vertebrata on the other seem to have adopted two different modes of life which led to concentrations of the nervous system in different parts of the body. The trochophore stock took to crawling on their ventral surfaces and their locomotor organs were developed in this region of the body and in connexion with them the motor ganglia which make up the ventral nerve-cord; whereas the vertebrate stock took to swimming by lateral blows of their blade-like bodies and this led to the concentration of the central nervous system in the mid-dorsal line.

Enough has been said to give evidence for our belief that the most recent research has tended to reëstablish the recapitulatory element as the fundamental factor in life-history, and if this be admitted the study of comparative embryology opens up a means of investigating the early history of life at a stage long before it left evidence of its existence in the stratified rocks; and, further, the acceptance of recapitulation involves a conception of the laws of heredity entirely distinct from and supplementary to that suggested by Gregor Mendel and his followers.

ENCEPHALITIS LETHARGICA (from Gk. ἐγκέφαλον, a portion of the brain, and λήθαργος, forgetful), a specific infectious disease of the nervous system, of which the most frequent, though by no means invariable, symptom is drowsiness or lethargy, often associated with paralysis of the muscles of the eye, producing diplopia or double vision.

In recent years this disease first appeared in epidemic form in Austria in the winter of 1916, and was described and named by C. von Economo in Vienna in 1917. It reappeared in the following winter, and was recorded in France in March 1918 by A. Netter. In England it was first recorded in April 1918, independently by Wilfred Harris and A. J. Hall. These earlier epidemics were all recognized by the combination of lethargy and diplopia. Subsequently the same seasonal incidence has prevailed, the number of cases diminishing in summer and increasing in winter and spring. In the United States it was reported in March 1919, the epidemic having spread from east to west.

The literature of medicine has been ransacked to ascertain whether or not previous records exist of the occurrence of the characteristic combination of symptoms. In 1890 a small epidemic occurred in North Italy, and later in Austria and other countries, which may be accepted as Encephalitis Lethargica. At the time it was known as Noma. It attracted little attention. The evidence for sporadic cases since then is doubtful.

Previous records are all doubtful. Hippocrates, Sydenham and other less-known authorities have described conditions which may or may not have been Encephalitis Lethargica. Stahl in 1779 recorded more fully an outbreak characterized both by lethargy and diplopia, and with other very suggestive symptoms. Franck in 1837 divided Encephalitis into various types, including a lethargic form which he stated occurred frequently as a result of epidemics of influenza.

Whether or not the observed combinations of symptoms have ever occurred before, the question early arose whether the syndrome should be regarded as a clinical entity or as a special manifestation of some disease previously known in other forms. The three diseases with which its relations have been more particularly considered are botulism, influenza and acute poliomyelitis or Heine-Medin's disease. Botulism results from the consumption of infected meat or other food, usually ham, and is especially characterized by paralysis of the eye muscles. The disease is due to infection with a specific bacterium—the bacillus botulinus. Since the most careful search has invariably failed to detect the presence of this bacillus in Encephalitis Lethargica botulism can be finally excluded. With regard to influenza, the appearance of Encephalitis Lethargica, including Noma as such, has approximately coincided with epidemics of influenza in 1889 and at the present time. On the other hand, there is considerable evidence against their identity. Influenza is highly contagious, while the clinical appearance of Encephalitis Lethargica occurs in an irregular manner and has not attained any great magnitude as an epidemic. When Encephalitis Lethargica commenced in Austria influenza had not yet appeared. There are also histological differences, since in influenzal encephalitis there is marked oedema of the brain and an absence of the two special characteristics of Encephalitis Lethargica—vascular congestion and infiltration of the perivascular lymph spaces. Pfeiffer's bacillus, the so-called influenza bacillus, is not found in Encephalitis Lethargica.

The relations of Encephalitis Lethargica to Heine-Medin's disease have led to much discussion. Unusual forms unquestionably occur in which the diagnosis is doubtful, both on clinical and pathological grounds, but, considering typical forms, there are striking differences between the two diseases. Heine-Medin's disease particularly attacks persons under 20 years of age, and tends to increase in frequency in summer. The onset of the general symptoms and of the paralysis is acute, the course is brief and the spinal cord is mainly affected. In Encephalitis Lethargica, on the other hand, persons of all ages are liable to attack, and the frequency is greatest in winter and spring. The onset is usually insidious, the course is lengthy, and the mid-brain is especially affected. Histologically there are also important differences. Microscopic haemorrhages are constant in Heine-Medin's disease, while perivascular infiltration is slight, the reverse being true of Encephalitis Lethargica.

Symptoms.—Encephalitis Lethargica was primarily recognized by the occurrence of the combination of lethargy and double vision, the latter being due to paralysis of the muscle of the eye. While pathological drowsiness in varying degrees is probably present in 70 to 80 per cent of cases at some stage of their course, further observation has revealed the occurrence of numerous other manifestations. The disease is widespread through the nervous system, and the complexity of the structure of the nervous tissues, together with the high degree of specialization of the functions of its various parts, explains the protean nature of its symptoms. Numerous "types" have been described, but the value of these is slight, as a single patient in the course of a few days often exhibits the characteristics of many such types. The clinical manifestations are probably best classified as Walshe suggested, according to the broad scheme proposed for other nervous diseases many years ago by Hughlings Jackson. In the following description based on this system, "positive" symptoms denote exaltation of function, which may be due either to irritation of nervous tissue or to a loss of the control exercised normally by the higher centres of the brain, while "negative" symptoms denote depression or loss of function principally due to destruction of nervous tissue.

A. *General Symptoms Due to Toxic Infection.*—These include weakness, headache, often occipital with some stiffness of the neck, shivering, vertigo, muscular pains and vomiting or other gastro-intestinal disturbances. The pulse may be rapid and eruptions, usually resembling measles, occasionally occur. The temperature is variable, and it has no characteristic course. It often rises after some days from 101° to 105° F. for a short period, but may be more prolonged, or pyrexia may be absent throughout.

B. *Nervous Symptoms.*—These are general and focal, the latter being due to affection of highly specialized portions of the brain.

(I) *General Nervous Symptoms.*—Positive symptoms are delirium, mania, restlessness and various degrees of excitement, while the more common negative manifestation is the characteristic lethargy, in all grades from simple apathy to complete coma. Innumerable degrees occur of these two extremes, or even combinations. The

patient may slowly drift into a somnolent state or may not uncommonly combine somnolence by day with insomnia or restlessness by night. Rarely an attack commences suddenly with the wildest delirium or mania.

(ii) *Focal Nervous Symptoms.*—The positive symptoms include the following:—

(1) Convulsions, which are occasionally generalized, resembling the epileptiform fit.

(2) Involuntary movements. These may develop during the attack or several months later in the course of convalescence. Numerous forms occur. The "myoclonic" type is characterized by short, rapid, rhythmic contractions of muscles, especially affecting the abdominal muscles and also the diaphragm, but the entire musculature or any group of muscles, or even a part of a single muscle may be affected. The contractions are 30 or 40 to the minute. Epidemic hiccough is possibly a variety of this type. Tremors, choreiform, athetoid and other movements of muscles may develop after the attack, some causing coarse spontaneous movements of large amplitude.

(3) Rigidity. This group includes the "Parkinsonian mask" and catalepsy, the latter being a condition of rigidity in which the limbs are retained for long periods in the position in which they are placed by an observer. The Parkinsonian mask, an expressionless facies, is common, and combined with rigidity produces the appearance of acute paralysis agitans, or Parkinson's disease.

(4) Muscular pains. These may be severe.

The negative symptoms are represented by paralyses. The commonest of these is the characteristic affection of the muscles of the eye, especially those innervated by the third pair of cranial nerves. The principal clinical symptoms are ptosis or drooping of the eyelids, double vision and paralysis of the muscles of accommodation. The pupils are often unequal and their reaction altered, the most common change being loss of reaction to accommodation while still reacting to light; but in rare instances the Argyle-Robertson reaction may be present. Optic neuritis is extremely rare, and never advanced. Less common are affections of the remaining cranial nerves, producing facial paralysis, difficulty in swallowing or in production of speech, etc. No portion of the nervous system is immune, and instances occur with paralysis of limbs and other parts, producing monoplegia, hemiplegia, diplegia, or aphasia. The sensory system is much less frequently affected. The deep reflexes are commonly but not invariably absent.

Morbid Anatomy.—The small vessels of the brain and meninges are dilated, the congestion often being visible both to the eye and under the microscope, but the most characteristic change is infiltration with small round cells of the perivascular lymph spaces, surrounding the capillaries. Other less constant and less conspicuous changes include degeneration of the nerve cells and destruction of neurons, proliferation of the mesoblastic cells lining the vessel walls and of the glial cells, and the occasional occurrence of haemorrhages and of thrombosis of veins. The lesions are most common in the mid-brain and basal ganglia, but any portion of the nervous system or meninges may be affected.

Prognosis.—Excluding mild and abortive cases, and the so-called *formes frustes*, the mortality is about 33 per cent. Including all cases it is under 20%, but the exact figure is doubtful. Deaths usually occur within three weeks from onset. The duration may be many weeks or even months. Alteration of the mental functions may be prolonged, and paralyses, aphasia and other changes have persisted long enough in some instances to be regarded as permanent, but when recovery takes place, it usually becomes complete.

Treatment.—This is on the general lines of treatment of acute febrile disease. Hexamine is usually administered. Netter strongly advocates the production of a local abscess by the injection of turpentine, 1–2 cc., into the thigh, but the value of this is not yet confirmed. (H. L. T.)

ENGINEERS, MILITARY (*see* 9.406*).—In the earlier article it was pointed out that in the early days of warfare, and in Great Britain up to the wars of Marlborough, the engineers of an army were the builders of fortifications, and also the manufacturers and directors of engines of war. In 1716 the first separation of specialists occurred when the Royal Artillery was definitely formed into a separate regiment. British engineer officers, left to their more specific duties of defensive works and of military surveys, were, until 1757, frequently holders of commissions in the infantry, and it was not until the siege of Gibraltar, towards the end of the 18th century, that any nucleus of enlisted rank and file was added to the corps of officers, who by that time were called Royal Engineers. This creation of specialist branches of military engineers naturally continued with the progress of engineering in civil life, and its application to military needs. Thus, after the experience of the American Civil War in 1861–5 had brought to light the extreme value of the electric telegraph in military operations, a telegraph troop was added to the Royal Engineers in 1870. This unit was shortly afterwards utilized by the British Post Office in connexion with civil telegraph duties, and for many years afterwards the connexion between the army and the civil department concerned was maintained in Great Britain to the great advantage of the military engineers, who by constant practice in the working of civil lines of telegraph were being prepared for this task in war. Gradually, however, the military specialties tended to develop, and the units concerned came to have a somewhat special equipment and to be divided into air-line companies (where the wires are carried on light poles rapidly erected), cable companies (where insulated cable is laid in any ground in any convenient way), and wireless.

Prior to the outbreak of the World War the signal service in the British regular army consisted of one signal squadron, 5 signal troops (for one cavalry division and 5 cavalry brigades), 6 divisional signal companies, and 4 other units. Some 20 more units were formed on mobilization, the total establishment for the Expeditionary Force being 78 officers and 2,367 other ranks. In the Territorial Force there were 5 army troops and 14 divisional signal companies, the former units being subdivided into wireless, air-line and cable companies. In 1918 the total numbers had increased to 2,409 officers and 60,264 other ranks, exclusive of Dominion forces and those on the Indian establishment. The number of units was upwards of 400, operating at home and in practically all the theatres of war, and including despatch riders, messenger dog service, carrier pigeons, wireless motor sections, and subsections attached to field and garrison artillery. The materials were partly obtained from the G.P.O. in England, but also from sources under the direct control of the director of fortifications and works who had under him five factories for the manufacture of special wireless sets, telephones and cables. The scale of supply may be inferred from one item alone, viz., insulated cable, of which enough was sent to France in one year of the war to go 10 times round the globe. Such an immense development as this, however successfully it was carried out (and there is no doubt on this point), evidently demanded an organization of its own, and consequently, after the war, a new branch was formed called "The Royal Corps of Signals."

In like manner the British Air Service, in 1912, was separated from the Royal Engineers. The first steps to form an aerial observation corps were taken about 1878, although individual officers had taken up the subject at a much earlier period. Aerial observations and photography from balloons were carried out on active service in the Sudan and Bechuanaland in 1884–5 and throughout the South African War 1899–1902. The development of the internal combustion engine, however, in the early part of the present century, made the dirigible balloon possible, and the application of this engine to heavier-than-air machines in 1907 introduced into war a new factor of the utmost importance. The Air Battalion of the R.E., which in 1911 was mainly occupied with balloons, kites and airships, and had made some progress in developing the new inventions, became early in the following year the military wing of the Royal Flying Corps.

To some extent the work of submarine mining, brought to great perfection by the R.E. in connexion with coast defence, in the closest coöperation with garrison artillery and defence electric lights, belongs also to this category. It was abolished, in so far as its connexion with the army is concerned, in 1905, its work being handed over to the Royal Navy. In this transfer, however, the coöperation between guns, lights and mines could not be carried out as before, and the reason for the change is not that of the two other instances, viz. the great growth and importance of the branch of engineering concerned.

While, however, the growth of special branches necessitated their severance from the parent corps, the exigencies of war brought into being other branches of a nature previously unforeseen. Besides signal units, the normal composition of the R.E. before the World War included field, fortress and railway companies, with field squadrons for the cavalry, and bridging trains with armies. Although these still continued, with numbers enormously increased, other special branches soon began to be formed. Army troops companies (formed out of the fortress

* *These figures indicate the volume and page number of the previous article.*

companies), were needed to carry out work behind the field companies in the front line, electrical and mechanical companies to deal with machinery of all sorts, army workshops companies, base park and advanced park companies to feed the insatiable demands of the fighting line for prepared trench materials and other such requirements. For mining warfare, tunnelling companies, officered by mining engineers, were enlisted and did magnificent service. For water supply, boring sections were needed, and in Egypt water-supply companies; for surveying, field survey battalions and companies, and for sound-ranging and observation (in conjunction with artillery) special sections and groups were formed. The inundation of some parts of the line and the land drainage of others demanded special sections, mostly enlisted in the English Fens. Field and anti-aircraft searchlights absorbed a large number of sections. Timber supply became a matter of urgent importance in the second year of the war, and forestry companies had to be formed to fell and prepare the quantities of timber needed for field engineering. The science of camouflage called for special units to deal with the provision and erection of concealing material. Chemical warfare demanded specialists both in preparing and projecting the new element of war. Meteorology played a new and important part, and it too required special units to take and record observations. The army post-office work devolved on the Royal Engineers. All these were altogether apart from the signal units, already touched upon. There was, further, the transportation branch, which formed a large and important feature in the area behind the line, and was divided into two main organizations (subsequently combined under one director-general), viz. Roads and Railways, and Inland Water Transport.

The former had railway construction companies, survey and reconnaissance section, a railway signal and interlocking company, wagon erecting companies, broad gauge workshop companies, and miscellaneous trades companies, with electrical sections; light railways operating companies, train crew companies, and forward companies, also miscellaneous trades companies, workshop companies, and light tractor repair companies. There were also training schools, chiefly for light railway work. There were numerous traffic sections, and broad gauge operating companies; there was a transportation stores company, and a steam boiler repair company. In connexion with roads there were several road construction companies, and quarry companies with a quarry maintenance section, most of these enlisted in the Welsh quarries.

The Inland Water Transport had headquarters' units at various places in England—Richborough, where a magnificent new port was built, Southampton and Poplar. There were workshops and shipyard companies, and construction companies at Richborough and several other places in England, and port construction companies at many ports in France. There were marine companies, traffic companies and train ferry companies in England, while in France there were sections working all over the canals on the army areas, with headquarters at Aire.

In Egypt there were sections at Alexandria, on the Suez Canal, and at various places on the Nile; in Italy at Taranto; in E. Africa at Dar-es-Salam and some other ports; in Russia at Murmansk. But perhaps the greatest work done by this branch, except in France, was in Mesopotamia, where the organization at Basra included vessels, marine engineering, accounts, dockyards and shipbuilding, native craft, I.W.T. Stores, buoyage and pilotage, conservancy and reclamation, camps, coal depot, barge depot and construction H.Q., both on the Tigris and Euphrates. There were detachments at various places on each of the great rivers, and on the Persian lines of communication at Karun and Ahwaz, and also at Muscat.

At the outbreak of war the corps of R.E. consisted of 1,831 officers and 24,172 other ranks. On Nov. 11 1918 there were 17,711 officers and 322,730 other ranks. The above figures include regulars, special reserve, territorials, and all signal and transportation units, but not from overseas or India.

As regards troops from overseas it is perhaps sufficient to say that their strength was in proportion normally to the total numbers of all arms, but that in addition there were tunnelling companies from the Australian and Canadian mines (who did good service in France and in Palestine), and forestry battalions from the backwoods of Canada, who did most useful work in France, and also in Cyprus for the supply of timber to the armies operating in the eastern Mediterranean littoral.

Mention may here be interposed of two cognate organizations, one of which never was actually incorporated in the R.E.; the other was part of the R.E. at one time, but was allowed gradually to disappear, or be merged in corps raised for work other than R.E. The former were the pioneer infantry battalions, to be supplementary to R.E. labour, on the principle well known in India, where such battalions, officered by infantry officers, and trained to a greater extent in field engineering than the average line battalions, had proved most useful. There was one such battalion per division, and the intention was that they should normally be associated, much more closely than other infantry, with the field companies Royal Engineers. The labour battalions, 11 of which were raised, were all of the professional navvy class, all over military age, and officered by civil engineers, architects, surveyors, etc. They did excellent work and of a nature which was by no means unskilled. Whether the later policy of absorbing the personnel into labour companies, who did absolutely unskilled work (unloading ships, etc.), was wise, cannot be here discussed, but it had the effect of removing from the engineers' control a very valuable body of men.

One other Indian innovation was also introduced, viz., the appointment to corps and armies of field engineers and assistant field engineers, *i.e.* officers of civil-engineering experience (either R.E. or civilian) whose business it was to execute works, in the area of their corps or armies, by means of civil labour.

Organization at Headquarters and in the Field.—At the War Office the organization for developing and controlling not only the personnel, briefly indicated above, but also the design and execution of works and the design and provision for engineering equipment and plant, was divided among three of the principal branches of the Department, viz., one section under the adjutant-general had to raise and maintain all the above units; under the quartermaster-general the director of movements had to organize and control the transportation branches (railways and I.W.T.), while the director of fortifications and works and the branch of the master-general of the ordnance were responsible for all the technical design and execution of engineering works at home, and for supplying the varied and complicated machinery and plant for the engineering needs of the armies in the various theatres of war. This involved also the carrying-out of a series of experiments on all sorts of inventions, though after the war had progressed for some time this duty was partly taken over by the Ministry of Munitions, which in other respects did not supply military engineering needs.

The works directorate was divided into 12 branches, each under a senior officer of engineers:—(1) Rifle ranges, artillery practice grounds and lands generally; (2) hutted camps and barracks; (3) coast fortifications (on the E. coast of Great Britain especially); (4) ordnance store buildings; (5) aviation buildings, until Jan. 1918, when the Air Ministry was formed; (6) design branch, for evolving and coördinating all designs; (7) personal matters arising out of the employment of civilian engineers, electricians, foremen, surveyors, etc., on military works, in themselves a large host; (8) mechanical engineering and supply of stores connected therewith to armies; (9) electrical stores and experiments, which included the inspection branch, also telephone factories, and a wireless experimental station; (10) liaison branch with all armies in field, dealing with all miscellaneous needs; (11) experimental and equipment section; (12) contracts, schedules of prices, and quantity surveying.

Temporary training schools and depots were found, not only at Chatham and Aldershot for dismounted and mounted men as usual, but at Longmoor for railway men, at Hitchin and Bedford for signallers, at Newark, Deganwy (N. Wales), Irvine (Ayrshire), Buxton, and Brightlingsea (Essex) for training sappers. The wireless experimental section at Woolwich and the electric light school at Portsmouth also were valuable training depots.

As regards the organization in the field there was at first neither an engineer-in-chief nor a chief engineer for each army. There were senior engineer officers, one at G.H.Q. and one at the H.Q. of each corps, but their duties were advisory only, and they had no power of purchase, or of engaging civil labour. This organization was a deplorable legacy from the S. African War, when the nature of the campaign was so different from that in Europe.

On the lines of communication, on the other hand, there was a director of works, with a proper staff and adequate powers, but he had no part in any military operations, nor, judging from the *Field Service Regulations*, was it contemplated that, except in the rare possibility of a siege, there would be anything in the nature of engineering in war that could not easily be done by the field companies under their divisional generals. These numbered two per division under a lieutenant-colonel. In 1911 a committee under Lord Kitchener had recommended raising the number to three. But in 1914 this had not been carried into effect, many officers of experience considering that such increase, though possibly desirable, was not a matter of urgency. The first few weeks of the war altered all this. A new organization became imperatively necessary, and the increase of personnel was nowhere more marked than at G.H.Q.;

whereas in 1914 the entire staff of engineer officers at G.H.Q. was one brigadier-general, in 1918 this staff was one major-general, two brigadiers and 19 other officers. Similarly the engineer staff of each army was increased from one to 11 officers—one for water supply, another for bridging, others for mining, camouflage, stores and so on.

The field companies, whose losses in the first few weeks of the war were very great, were increased at once from two to three per division, and a pioneer battalion in addition gave each divisional-general a sufficient supply of both skilled and unskilled labour for him to make tactical use of engineering works. It was not intended that these troops should be used as infantry except in the gravest emergency, although in some cases this was not borne in mind, and the casualties which resulted made the want of such technical troops more acutely felt than ever.

Under the direct orders of the chief engineer of an army corps there were two or three army troops companies R.E., two or three tunnelling companies, a company or two of a labour battalion, and miscellaneous working parties and transport lorries.

Field Companies.—As the field companies were the most numerous of all the R.E. units (there were some 160 of them in France in 1918) as well as being the normal organization of military engineers—corresponding to a battalion of infantry, a squadron of cavalry and a field battery of artillery—it may be as well here to say a little about their organization. The field companies of the regular army (of which there were 13 in 1914) were formed about 1879 by adding to a few selected fortress companies a section of mounted drivers with transport to carry ordinary entrenching tools, and the special tools needed for the various tradesmen of which the company was composed. At that time the companies were almost exclusively employed on barrack maintenance, and, while subject to military discipline and trained as infantry in drill and musketry, they were given little or no special training as field engineers. But from the experience of the Egyptian and Sudanese campaigns of 1882–5 there began a steady improvement in their rôle as a valuable tactical arm. About 1885 each company was taken off the works annually for a course of field work instruction. In 1889 continuous engineer's pay, instead of working pay for actual hours spent on works, was introduced, a matter of the utmost importance, for it enabled men to be taken for military training without penalizing them in respect of pay, while their trade skill could still be economically utilized on works when they were not otherwise employed. The gradual improvement in the military training of this arm, and its coöperation with other arms, was, after the S. African War, still further developed by having the companies posted to army divisions under the direct responsibility of division headquarters, and by the participation, by all ranks, in the divisional training schemes. Further, young civil engineers were, by arrangement with the Institution of Civil Engineers, given commissions in the R.E. Special Reserve, and after some preliminary training were attached to field companies.

Each company consisted of six officers, all mounted, with about 220 other ranks, of whom about 75% (dismounted) were tradesmen, the remainder being drivers. There were some 60 horses and mules, with the following vehicles:—four double tool carts for tools and equipment, three pontoon and trestle wagons for bridging plant, and a special vehicle for explosives, sandbags, cordage, etc., with the general transport vehicles appropriate to a unit of this size and composition. The company was organized in four sections, each under a subaltern, so that each section could be detached, with its own tools, for some specific task. There were also some pack animals to take tools, etc., to places where wheeled vehicles could not go. A certain number of the dismounted men were cyclists whose business it was to reconnoitre ahead and bring in information.

Although the greater part of the sappers (dismounted men) were skilled tradesmen, there was introduced, shortly before the outbreak of war, a certain dilution of skilled labour in the form of "pioneers," men who were trained in ordinary field work, but had not been taught a trade before entering the army. Whether this dilution was on the whole satisfactory is a matter on which there is difference of opinion. There is, however, no doubt that as regards the officers, the greater their knowledge and experience of engineering work the better, owing to the variety of the work that falls on a field company in war. Moreover, the development of weapons and the weight of guns, tanks, etc., which came to be used in the war revolutionized much of the previous practice. No longer were combinations of timber, brushwood and earth sufficient for field defences, nor pontoons and spar bridges sufficient to cross rivers. Concrete and steel had come into the field, and the engineers accustomed to use these in peace had to take them in hand for war, and to see that rapidity of construction was combined with stability and strength.

Broadly speaking, the duties of the field companies were field defences, mining, demolitions, water supply and distribution, and temporary roads and bridges, in the fighting zone. Behind these came the army troops companies R.E. and the many special units whose duties are indicated by their nomenclature.

The School of Military Engineering.—It is evident that to train officers and men—the former especially—for the varied tasks that lie before them in war, some very special instruction is needed in peace. This is supplied by the School of Military Engineering at Chatham, to which every R.E. officer after receiving his first commission is sent for a course of instruction, lasting normally two years. This school owes its origin to the Peninsular War. In that campaign at first there were no trained sappers, and the officers of the R.E. were woefully ignorant of such military subjects as the demolition of bridges. As a result of Lord Wellington's representations, and the advocacy of an able engineer-officer, Col. Pasley, a school of instruction in siege works was begun in 1812 at Brompton barracks, Chatham. In course of time instruction in other branches, *e.g.* construction, surveying, electrical and mechanical engineering, chemistry, astronomy, etc., was added; and in spite of certain disadvantages, *e.g.* the growth of houses and establishments round the school, and the absence of troops of other arms with whom combined training could be carried out, the work done at this school has been of the utmost value both in war and in peace, for officers and men trained there have gone to all parts of the Empire and made their mark in works of public utility and permanent value.

The training in the pre-war period was as follows:—The two years' course is approximately divided into four equal parts under each of the chief instructors, in field fortification, construction, surveying and electricity. The officers are attached to depot companies in one or other of the battalions of R.E. under training, and thus, concurrently with their technical training, they learn the routine of military administration, discipline and drill. As regards the four main courses of instruction it is evident that in the short time available only the rudiments of each subject can be taught. In a profession which admits of so many different avenues of service to the country it is evident that the preliminary course of instruction should include that which is likely to be of value in each and every capacity. There must be a difficulty in arranging such a course when it is borne in mind that one officer may devote his life to purely military studies, another to the scientific work of, say, the Survey of India, another to railway constructions, another to electric developments and so on. Yet there is doubtless some common ground in which all must be trained before diverging, and this is the object of the Chatham training. In field fortification, besides the principles of defence, already learned by the officers in the cadet stage of their career, there is the practice of entrenchments, redoubts, military mining and demolition; there is, further, construction of light railways and of field shelters, water-supply expedients, and other miscellaneous subjects. This course is largely out of doors, and is specially valuable in teaching young men how to organize and handle skilled and unskilled labour. The survey course includes instruction in all surveying instruments and in the practice both of large survey operations and of the rapid operations frequently necessary in military exploration, and in combining the work of several observers in an unknown country. In the construction course lectures are given on building materials and builders' trades, on applied mechanics and hydraulics, on water supply, sanitary engineering, roads and railways, the design of structures, including bridges, reservoir walls, etc., and the ordinary methods of execution. Visits to engineering works in progress are included in the course.

Theory and practice are combined in this as well as in the mechanical and electrical engineering courses, the details of which are on similar lines. Care is taken to keep in close touch with the best civil-engineering practice in the country; eminent civil engineers are invited every winter to deliver lectures, and after the completion of the course selected officers are sent to work for six or eight months on one of the great railway lines, either to learn traffic control, or to be more thoroughly equipped in mechanical engineering in the railway workshops. Other officers go to the electric light school at Portsmouth for special training. (G. K. S.-M.)

United States.—The army which in its circumstances bears the closest resemblance to the English is that of the United States. Both countries recruit their armies by voluntary enlistment, and both use to some extent their military engineers, after completion of their training at a military school, in some form of civil-engineering service in peace.

From 1901 to 1916, the maximum authorized strength of the Corps of Engineers was 248 officers of all ranks, and 1,968 enlisted men forming 3 battalions of 4 companies each. The officers not needed for service with the troop units were employed on civil public works, inasmuch as the Corps of Engineers is charged with the improvement of harbours and rivers, both coastal and inland. As in the case of English officers in the civil-engineering departments in India and the colonies, this employment proved to be of great value in war in that it had trained them "to take heavy responsibilities; in the habit of making weighty decisions; meeting sudden emergencies; in the organization, operation and care of large bodies of men; and working with men not familiar with or subject to [army] discipline."

In the United States, officers for the Corps of Engineers are obtained from two principal sources, namely, the U.S. Military Academy at West Point, and the leading civilian engineering colleges. The Military Academy is not an engineering school, and, although the course furnishes a good foundation for an

engineering education, its graduates appointed to the Corps of Engineers nevertheless require additional instruction in engineering subjects. To that end they are detailed as special students for about a year at the more advanced civilian engineering schools.

Graduate engineers appointed from civil life need military instruction and are sent to the Engineer School of the U.S. army immediately upon being commissioned. Subalterns of both classes, after completing their basic military education, are assigned alternately to duty with troops and on civil construction, where their training is continued for several years in accordance with a scheme formulated by the chief of engineers. This whole procedure, which is possibly more formal than that prevailing in the British service, has the same end in view, namely, to give the officer a " well-rounded mental and professional development " which fits him for any service that war may entail. Selected officers of more mature age pursue advanced courses at the Engineer School and become eligible for the School of the Line, the General Staff School, and the Army War College, where they are instructed in the combined use of all arms of the service and the various duties of the general staff and the high command.

Under legislation effective June 3 1916, the Regular Army of the United States was reorganized and expanded. Provision was also made for a reserve to be composed of (a) local forces in each state, and (b) a reserve corps of officers and of enlisted men. The former were the state National Guards, but in an emergency were subject to service under the Federal Government. The Reserve Corps was answerable directly to the Federal Government. Under this Act the Corps of Engineers of the regular establishment was to consist of 505 officers of all ranks, and one band; 7 regiments (foot), and 2 battalions (mounted) of enlisted men. The increase was to be made by five successive increments, so that on April 6 1917, when the United States declared the existence of a state of war, the Corps of Engineers numbered only 256 officers and 2,228 enlisted men, the latter being organized in 3 regiments and one mounted company. There were, in addition, a few engineer troops organized as components of the National Guard.

During the World War, Congress passed a series of Acts affecting the military establishment and created a fourth element called the National Army, which name was applied to the organizations raised especially for the emergency, partly by voluntary enlistment and partly by the selective service law. In Aug. 1918, the distinctive appellations were discontinued and the 4 elements, viz.: the Regular Army, the National Guard, the Reserve Corps and the National Army, were merged and the single term " The United States Army " was applied to the entire military force.

At the time of the Armistice, Nov. 11 1918, the standard combat regiment with its train had a strength of 49 officers and 1,695 enlisted men. At that time the engineer establishment consisted of 7 regiments (foot), 2 battalions (mounted), and 8 engineer trains derived from the regular establishment; 17 regiments with trains derived from the National Guard, and 31 regiments derived from the National Army, a total of 55 regiments, all assigned to divisions. There were also 6 regiments assigned directly, one to each corps headquarters. These 61 regiments were all of the pioneer-sapper type; but there were also special engineer troops allocated to various headquarters, both at the front and on the lines of communication, for the construction, maintenance and operation of railways; for the assemblage and maintenance of railway equipment; for the construction, operation and maintenauce of light railways; for the construction and maintenance of highways; for the construction of barracks, quarters, storehouses, wharves and other miscellaneous structures; for the production of lumber and timber products; for camouflage; for flash- and sound-ranging; for water supply, mining, quarrying, electrical and mechanical installations and operations; for surveying, printing, and the reproduction of maps and charts; for the operation of port facilities; for the operation of searchlights; for motor transport, chemical warfare, and " general service."

The " general service " force was composed of whites and corresponded to the British labour battalions. There were in addition certain labour units, called Pioneer Infantry, composed of negroes officered by whites. The special engineer troops were variously organized into regiments, independent battalions or independent companies, the strength of which was that of corresponding units of the standard Pioneer-Sapper regiments. The labour battalions usually consisted of 1,000 men with a proper complement of officers. Though originally organized under the Engineer establishment, the Motor Transport Corps, the Chemical Warfare Service and the Armoured Tank Corps later became separate organizations. The Railway Transport Corps was established as a separate service in France, but in America this branch remained under the general supervision of the chief of engineers.

During the war 13,527 commissions were issued to officers of engineers, and on Nov. 11 1918 there were 10,886 officers holding such commissions. The approximate total enlisted strength of engineer units was 285,000, of whom 233,000 were overseas, and 52,000 were in the United States and its insular possessions. Comparing this with the British strength it must be remembered that, on the one hand, in the American army the signal service is entirely distinct from the engineers; on the other hand, a certain amount of mechanical transportation is included, and the Americans made early provision for a large number of navvies for general engineering operations. The strength of the latter are included in the figures given for the American engineering service. The Quartermaster Corps of the American army, which constitutes its general supply service, had also a large number of labour units, generally composed of negroes with white officers.

The training of officers and enlisted men at temporary instruction camps was simplified by the fact that the officers were, in general, drawn from the engineering professions, and the enlisted men were drawn from various classes of artisans. The compulsory selective service law facilitated the assignment of each individual to that place in the military establishment for which he was best fitted by his peace-time occupation. The training in the instruction camps was therefore largely military, qualifying the personnel to apply to their military tasks the knowledge they had acquired as civilians in their peace-time vocations. As in England, the voluntary-enlistment principle permitted a number of well-qualified engineers and technicians to join, early in the war, the infantry, artillery and other combat units where their special training did not come into play. Their services would have been of far more value in the engineering or other specialist units. (G. A. Y.)

Lessons from the War.—It is possible to sum up a few of the lessons which the experience of the World War has taught.

There must be on the one hand the closest connexion and coöperation between the general staff and the engineers. The intentions of the commander must dominate the situation, and the engineering work must be coördinated so as to further such intentions, assist and develop them as far as possible. There must therefore be, on the part of the general staff, such early information on the subject to the chief engineer that he may not only work out his technical plans, but may consider whether the possibilities of engineering science may not be used to forward the end in view to an extent hitherto unsuspected by the general staff.

There must be constant coöperation with other arms, especially infantry, and this must form part of the training in peace.

There must also be close touch with the great civil-engineering institutions of the country. Apart from their great knowledge and experience of the developments of the profession of engineering they are in touch, in a way that can hardly be expected from military engineers, with the very latest developments of technical science, and with the ablest practical exponents of it on a large scale.

There must be the recognition that field defences, as such, are not the monopoly of the engineers. It is the business of the general in command, through his general staff, to decide when and where such defences should be constructed, and the senior officer of engineers should have a voice in the matter, but only in respect of technical matters involved. The training and duties of modern infantry enable that arm to carry out much of the required defensive work entirely without any engineer supervision or assistance, and they should be held responsible for such work. There is sure to be some work which is beyond the scope of infantry training, such as reinforced concrete, or the construction of " dug-outs," and this is clearly the business of the engineers, but in ordinary entrenchments, wiring and other obstacles, revetments, and light bridging, infantry must be trusted to do their own work.

The supply of engineering plant and stores must be under the engineers, and other arms should draw on them as required.

There should be both at the War Office and in the field a branch of the Intelligence Department dealing specially with engineering information. While there must be coöperation between the general staff, other arms and engineers in the fighting line, there must be the closest coöperation between the engineers there and the higher engineering authorities immediately in rear, *i.e.* the corps and army chief engineers, whose business it is to coördinate all technical operations.

As regards execution of work, whether by engineers or infantry, there must be (1) a carefully prepared scheme to ensure that each unit receives in good time clear instructions as to the nature and scope of work devolving on it; (2) rendezvous points must be carefully selected, notified to all concerned, and reliable guides told off to lead the working parties to the proper place by the best routes; (3) a proper scheme for issue of tools and plant, with definite responsibility for the return of tools in due course.

As regards the tactical employment of engineers the following points are worth noting:

In the encounter battle it may be advisable to attach either an entire field company, or a large portion of one, to the troops making the attack, just as some engineers are always told off to accompany an advanced guard on the march, in order to clear away obstacles and to ensure that, while progress is not arrested, important tactical points gained are consolidated. But, inasmuch as once an engineer unit begins a work, it should not hand it over to another unit while under construction, it is best that as further engineer assistance is required, it should be done by engineer units being pushed forward, " leap frog " fashion, from reserves. Close watching of the tactical situation by the commanding engineer is a vital necessity.

In the deliberate attack, as in trench warfare, there are the three

phases—preparation, assault, and following up. In the preparation the works are so numerous that the utmost care must be taken by the commanding engineer and the general staff that the engineer resources are devoted to the most important objects. Then in the assault, the engineers should never be sent with attacking infantry except with specific instructions for definite work for which they can prepare beforehand, *e.g.* the consolidation of tactical points or opening up a forward communication. Even then they should not follow the leading waves of attack too closely, as they get mixed up with the fighting line, and do not accomplish their actual work. The engineer-commander should retain within his immediate control as much of the personnel as possible for the all-important work of rapidly opening up forward communication during the attack, and also for the disposition of the engineers in the phase following up a successful attack, when the work is similar to that of the encounter battle, viz. securing the fresh objectives gained.

As regards defence there are (1) advanced works in close contact with the enemy—the "outpost zone"; (2) the main position of resistance; (3) one or more rear systems. The first of these will ordinarily be carried out by infantry, with possibly some engineer assistance. The main position will be developed by the divisional engineers, with such additional labour from other arms as may be possible to allot. Rear defensive positions will be undertaken, usually, under the orders of corps and army commanders.

In position warfare the engineer duties also include preparation for attack, arrangements for the comfort, security, and efficiency of the troops behind the line, development of communications, and duties in connexion with raids. It is essential that all the engineer units should be under the control of the commanding engineer, and that he should maintain a programme of the necessary works to be carried out, and obtain the orders of the divisional general as to the order of urgency. It must, however, be always borne in mind in this as well as in other defensive work that the responsibility for construction and maintenance of works on any sector of the system rests with the commander of the troops in that sector.

In the case of a forced retreat in the presence of a pursuing enemy the work of the engineers will be mainly the delay of the pursuit by demolitions, and the erection of obstacles, but will include also the preparation of successive defensive positions, and the construction of special communications to allow the withdrawal of troops and guns. The work requires careful coordination and control under great difficulties. As the movements of the engineer-units depend on the localities where the works are required, they will not usually correspond with the movements of infantry in touch with the enemy. The officers of engineers must keep in close touch with the situation, act with initiative and readily assume responsibility, keep their superior engineer-commanders informed of the situation and progress of work, and be ready to respond to any call for assistance, provided they are satisfied that such a call is warranted and is relatively more important than other orders.

Efficient liaison is of the utmost importance.

In all operations of war it is imperative that the engineers should have:—(1) A close and accurate knowledge of all developments of the tactical situation; (2) a thorough comprehension of the needs of the other areas; (3) definite schemes and estimates of men, time and materials, sufficiently accurate for practical purposes; (4) well-prepared arrangements for materials and for passing information to other divisions or corps adjutant or in rear. Having developed these, an engineer-commander should be able to furnish the general staff with sound and competent advice on the engineering aspect of the operations, and should be able to utilize to the best advantage the available resources. (G. K. S.-M.)

ENGLISH FINANCE (*see* 9.458).—In the period from 1910 to 1921 English national finance underwent changes of a very far-reaching character.

Pre-War Period.—When Mr. Asquith succeeded to the Chancellorship of the Exchequer under Sir H. Campbell-Bannerman's administration in 1906 he found that public expenditure had increased rapidly in the previous decade. In 1895–6 the total was £97,700,000; in 1905–6 it had risen to £150,400,000. Mr. Asquith was responsible for the Budgets for the three years ended 1908–9. His policy was one of consolidation and retrenchment, which was necessary in view of the costly character of the S. African War and the gradual rise of expenditure generally. On the whole his record at the Treasury during his period of office was good. He managed to check the growth of expenditure, but his work was chiefly distinguished by successful efforts to reduce the National Debt. In the three years ended 1908–9, he reduced the dead-weight debt by £43,500,000 to £711,400,000.

The social reform programme initiated by Mr. Asquith in the Old Age Pension scheme was greatly developed by Mr. Lloyd George when he took over the reins of finance, and its effects were so stupendous that it affected in profound degree the national finances for the ensuing decade. Mr. Lloyd George's first measure of expenditure was the National Insurance Act of 1911. In 1911–2 the total expenditure rose to £178,545,000, and in 1912–3 to £188,622,000 or £90,922,000 more than in 1908–9, when Mr. Lloyd George assumed office. The great increase in the Post Office estimates at this period was due to the acquisition of the National Telephone Company's undertaking.

The policy of the Liberal administration, which at first was economy, was turned by the pressure of political events into a policy of growing expenditure and taxation. In the period from 1909–10 to 1913–4, the expenditure on the navy rose from £35,-807,000 to £48,833,000, on the army from £27,236,000 to £28,346,-000, while that of the Civil Service jumped up from £40,010,000 to £53,901,000. Original estimates of the cost of Old Age Pensions were hopelessly wrong, and the total in 1913–4 had risen to £12,-600,000 or double the cost as estimated in 1908. About £2,500,-000 of the increase was due to the amendment of the law in 1911. Part of the excessive outlays on pensions was attributed to absence of compulsory registration in the first half of the 19th century. A large number of people in the rural districts were able successfully to claim the right to the pension, not because the claim was correct, but because the pension officers were unable effectually to contest the claim.

The policy of social reform to which the Liberal administration was committed produced, in 1909, a Budget, which will rank as famous in English financial history on account of the constitutional changes which it produced, and because events showed that Mr. Lloyd George's programme of land taxation, based upon an alleged appreciation of Henry George's theories, proved to be unworkable and fallacious. The Finance bill of 1909–10 was read a third time in the House of Commons on Nov. 4 1909, and was rejected by the House of Lords on the 30th of the same month. The Budget statement anticipated a revenue of £162,500,-000, or about £11,000,000 more than in the previous year. It actually produced £131,696,000, largely because on the Lords' rejection of the bill the collection of income tax and tea duty was suspended. After the general election in Jan. 1910 which kept the Government in office, the Finance bill of 1909–10 was reintroduced on April 20 1910, and the Lords passed it on April 29.

The principal features of this Act were that it made the estate and inheritance duties much heavier, that it raised income tax from 1s. to 1s. 2d. in the £, abolished the abatements granted to those resident out of the country and imposed a super-tax (an additional rate of income tax) of 6d. in the £ on incomes over £5,000, the first £3,000 being excluded from the assessment to this duty. But the big novelty of the Budget was the land value duties, which were chiefly responsible for the conflict with the second chamber. Four duties were imposed: the increment value duty of 20% on the increase in the value of land sites payable on land changing hands, the undeveloped land duty of ½d. in the pound on capital value; the reversion duty of 10% on benefits accruing from the termination of a lease of land; and the mineral rights duty of 1s. in the £ on mineral royalties, way leaves, etc. Agricultural land was excluded from the land value duties. The bill naturally involved a valuation of all land in the United Kingdom.

In the end the land duties were found to be very difficult to collect, and the advanced political assumption that there was something wrong about profits derived from the appreciation of the value of land had some extraordinary consequences. It certainly led to the break-up of big estates, but it wholly failed to produce revenue. The land value duties were originally estimated to yield £600,000 in the first year and a great deal more in future years. But these forecasts were woefully wrong. In 1910–1 the yield was £520,000; in 1911–2 £481,000; in 1912–3 £455,000; in 1913–4 £715,000; in 1914–5 £412,000; in 1915 6 £363,000; in 1916–7 £521,-000; in 1917–8 £685,000; in 1918–9 £664,000; in 1919–20 £663,000; and in 1920–1 £20,000. Their abandonment in 1920 was the inevitable result of their disappointing yield. Of course the yield of the duties depended a great deal upon the valuation of land establishing a datum line for the duties, and that could not be completed for many years. In 1920–1 it had not been finished. Meanwhile the larger proportion of the land value duties was derived from the mineral rights duty. The growth of mechanical transport, following the introduction of the internal combustion engine, led to the imposition of duties on motor vehicles, a part of the proceeds of which was allocated to a Road Development Fund, established in 1909. At the same time a development fund was set up for the purpose of promoting, by Government Departments, colleges, institutions, or persons not trading for profit, by means of loans or grants, agriculture, forestry, drainage, harbours, fisheries, transport by experimental work.

The National Debt, which had been reduced from £762,463,000 in 1909–10 to £707,654,000 in 1913–4, was destined to grow at an enormous rate during the European War. Figures showing the form of the debt are set out below:—

British National Debt in million £.

	Aug. 1 1914	March 31 1915	March 31 1916	March 31 1917	March 31 1918	March 31 1919	March 31 1920	March 31 1921

War Period.—The outbreak of war in Aug. 1914 was followed by a number of emergency regulations which were destined to have a profound effect upon the national finances during the war period. The Government decreed a general moratorium, and agreed to advance currency notes to bankers at Bank Rate to the extent of 20% of their deposits. At first the banks availed themselves of this facility to relieve the shortage of cash to the amount of £13,000,000, but by the end of Nov. 1914, when the moratorium expired, this amount had virtually been repaid. The banks found that Government expenditure provided them indirectly with all the currency they required, this of course being the inevitable effect of inflation. On Aug. 1 1914, the Government gave the Bank of England authority to suspend the Bank Act of 1844, but it was never acted upon, because the passage of the Currency and Bank Notes Act on Aug. 6 1914 rendered the suspension of the Bank Act unnecessary. The excess fiduciary issue was always turned into the currency note issue. The next step was the undertaking of the Government to discount at 2% above Bank Rate all pre-moratorium bills of exchange. The amount discounted was nearly £200,000,000, of which about £35,000,000 remained in cold storage until after the war.

The war was financed by means of Votes of Credit. There were 25 Votes of Credit, as set out below:—

Votes of Credit in the War.

1st—Aug. 6 1914	£100,000,000	
2nd—Nov. 15 1914	225,000,000	
3rd—March 1 1915	37,000,000	
	(Financial year)	£362,000,000
4th—March 1 1915	£250,000,000	
5th—June 15 1915	250,000,000	
6th—July 20 1915	150,000,000	
7th—Sept. 15 1915	250,000,000	
8th—Nov. 11 1915	400,000,000	
9th—Feb. 21 1916	120,000,000	
	(Financial year)	£1,420,000,000
10th—Feb. 21 1916	£300,000,000	
11th—May 23 1916	300,000,000	
12th—July 24 1916	450,000,000	
13th—Oct. 11 1916	300,000,000

15th—Feb. 12 1917	200,000,000	
16th—March 15 1917	60,000,000	
	(Financial year)	£2,010,000,000
17th—March 15 1917	£350,000,000	
18th—May 9 1917	500,000,000	
19th—July 24 1917	650,000,000	
20th—Oct. 30 1917	400,000,000	
21st—Dec. 12 1917	550,000,000	
	(Financial year)	£2,450,000,000
22nd—March 7 1918	£600,000,000	
23rd—June 18 1918	500,000,000	
24th—Aug. 1 1918	700,000,000	
25th—Nov. 1918	700,000,000	
	(Financial year)	£2,500,000,000
Total (1914–8)		£8,742,000,000

The average British National Expenditure in 1914–5 was £1,500,000 a day; it grew to £3,750,000 in 1915–6, to £6,587,000 in 1916–7, and to £6,986,000 in 1917–8. A rule was laid down by Mr. Reginald McKenna, who succeeded Mr. Lloyd George as Chancellor of the Exchequer in 1916, that the Budget should provide for all normal expenditure and the war debt charge. This standard of finance was high—higher than that aimed at by any other belligerent. Thus in the year 1915–6, expenditure amounted to £1,559,188,000, of which £336,737,000 was provided by revenue. Tax revenue amounted to £290,088,000 or 18·6% of the expenditure. In 1916–7, £573,428,000 was raised by revenue, or 26% of the total expenditure, tax revenue being £514,105,000, or 23·3 per cent. In 1917–8 tax revenue contributed 22·7% to the expenditure, the total revenue being 26·2 per cent. In 1918–9 tax revenue yielded 20·7 per cent.

Increased taxation was imposed in each War Budget. As far as possible the Government relied upon screwing up existing taxation, and avoided as far as possible the imposition of new taxes. The only new tax of any great importance was the Excess Profits Duty. This duty (*see* EXCESS PROFITS) was extraordinarily prolific and ranks as one of the most skilfully-devised fiscal measures of the war; it was largely imitated abroad. It sought to appropriate for national purposes a large slice of the exceptional profits secured by those engaged in business, and at the same time to provide a big new additional source of revenue. The duty was first imposed in 1915, and was applied for a period of seven years to all businesses. At first the rate was 50%; it was increased to 60% in April 1916, and from 60 to 80% in May 1917. No change was made in 1918, but in 1919 the rate was reduced to 40%; and raised again to 60% in 1920. In the budget of 1921 it was brought to an end.

Income Tax (*see* INCOME TAX) was doubled in the first War Budget introduced on Nov. 17 1914 by Mr. Lloyd George. It was raised from 1s. 3d. to 2s. 6d., and the rate for earned income was hoisted up from 9d. to 1s. 6d. in the pound. Super Tax was also doubled. In the third War Budget introduced in Sept. 1915 (the second was in May, 1915), 40% was added to income tax, the exemption limit was reduced from £160 to £130, and abatement limits from £160 and £120 to £120 and £100 respectively. The reduction made in Sept. 1915 in the limit of exemption to incomes below £130 increased the number of taxpayers by a very large figure, practically every working man being rendered liable to the tax. To meet the convenience of the working class taxpayers' quarterly assessments were introduced. These classes insisted upon a differentiation between married men and bachelors. This was made in 1918–9 and subsequent Budgets, the differentiation taking the form of an abatement in income of £25 in respect of a wife living with her husband.

An "entertainments tax" was introduced in the Budget for 1916–7, the tax ranging from ½d. on a 2d. ticket to 1s. on a 12s. 6d. ticket, with an extra shilling for every 10s. over 12s. 6d. In the following year this tax, which proved successful, was increased by 50 per cent. Other new taxes imposed in 1916

included a Customs and Excise Duty on matches, which was increased two years later. In 1918 the stamp duty on cheques was increased from 1d. to 2d., despite considerable protest from bankers and others that it would produce very undesirable consequences. A still more important change affecting the customs of the people was the abolition of the 1d. postage on letters. In 1918 the minimum charge for letter carrying was raised to 1½d., and that for postcards to 1d. In 1920 the minimum postage for inland letters was raised to 2d. for a weight not exceeding 3 oz., an extra ½d. being charged for every additional ounce. For inland newspapers the charge for postage was fixed at 1d. for weights not exceeding 6 ounces. Inland parcel rates were raised to 9d. for weights up to 2 lb., and 1s. for weights between 2 and 5 pounds.

In the three financial years ended March 31 1918 indirect taxation actually diminished, the yield in the last of these years being smaller than in the first. In 1915–6 the produce was 127½ millions, in 1916–7 134¾ millions, and in 1917–8 118¼ millions. But direct taxation, which in 1915–6 yielded 131½ millions, gave 348 millions in 1916–7, and no less than 473 millions in 1917–8. In the 1918 Budget indirect taxation was screwed up. The duty on spirits was raised from 14s. 9d. to 30s., while the beer duty was increased from 25s. to 50s. per standard barrel. Tobacco duty, which was raised by 1s. 10d. per lb. in 1917, was increased from 6s. 5d. to 8s. 2d. in 1918.

In 1916 there was much criticism of the Government's financial methods. Bank Rate was raised to 6%, and Treasury Bills were put "on tap" at 6% discount. Six per cent Exchequer Bonds were also put on sale. But the payment of these high rates for money (*see* MONEY MARKET) at a time of active inflation when money was abundant met with severe criticism. It was ostensibly designed to attract foreign money to London, but eventually it was decided to abandon the "dear money" policy and to offer a special rate, above the domestic rate, for foreign moneys. The year 1916 witnessed a new innovation in borrowing. What was described as the "continuous loan" principle was introduced in that year—namely, the daily offering of war securities instead of the flotation of fixed period subscription loans of the old fashioned variety. At first this type of borrowing was not very successful, but with the introduction of modern publicity methods in 1917 the continuous loan plan became a very remarkable success.

The following are the aggregate figures for the British financing of the war from Aug. 1 1914 to Nov. 16 1918, five days after the Armistice was signed:—

Total expenditure	£8,656,198,215	Yield of revenue	£2,220,235,719
Balance . .	6,141,062	Net borrowings	6,442,103,558
Total .	£8,662,339,277	Total . .	£8,662,339,277

In the tables below and on the next page are shown revenue and expenditure for the 12 years ended March 1920–1.

An important feature of English finance during the war period was the borrowing of money abroad, especially during the period of actual hostilities. The first loan was raised in the autumn of 1915, when the British and French Governments jointly and severally issued a loan for 500,000,000 dollars in New York. The position of Great Britain's foreign debt on March 31 1921 is shown below:—

Foreign Debt, 1921.

Debt to:—	In Currency.	In Pounds Sterling at Par of Exchange.
U.S.A. Government .	$4,196,818,000	£862,362,000
Total to U.S.A. . .	4,733,214,000	972,704,000
Canadian Government . .	132,326,000	27,190,000
Total to Canada . . .	257,326,000	53,339,000
Sweden	Kr. 12,500,000	826,000
Straits Settlements. .	—	7,656,000
Mauritius . .	Rs. 8,071,300	538,000
Allied Government .	—	126,500,000

The total foreign debt, expressed in pounds sterling at the par of exchange, was, on March 31 1921, £1,161,563,000, a decrease of £117,151,000 on the total as on March 31 1920, and of £23,287,000 from the highest point reached on March 31 1919.

The figures of the deadweight debt, which included the foreign debt, were as follows in each of the financial years 1909–20:—

1909–10 . .	£ 713,245,000	1915–6 .	£2,140,749,000
1910–1 . .	685,232,000	1916–7	4,011,446,000
1911–2 . .	674,744,000	1917–8 .	5,871,851,000
1912–3 . .	661,474,000	1918–9 .	7,434,949,000
1913–4 .	651,270,000	1919–20 .	7,829,000,000
1914–5	1,108,817,000	1920–1	7,573,000,000

The amount of advances and loans to the Allies on March 31 1921 was made up as follows:—

Russia	£ 561,400,000
France	557,000,000
Italy	476,800,000
Belgium (war)	94,400,000
Belgium (reconstruction)	9,000,000
Serbia	22,100,000
Portugal, Rumania, Greece and other Allies . .	66,200,000
TOTAL	£1,786,900,000

Loans to the Dominions were made up on the same date as follows:—

Australia	£ 90,000,000
New Zealand	29,600,000
Canada	13,800,000
S. Africa	7,500,000
Other Dominions	3,100,000
TOTAL	£ 144,000,000

Further tables show income-tax rates, and the yield for total direct taxation, 1910–21

Revenue 1910–21 (000's omitted).

NOTE.—The figures in the above table give the amount of the actual *net receipts* derived from the Revenue due to the Exchequer.
* The net receipt of Property and Income Tax, etc., represents the amount of tax actually collected within the year (irrespective of the year of assessment) less the amount of Tax refunded, etc., within the year. The amounts under the several schedules show the approximate net receipt of the Tax based on the assessments of property and income under each schedule.
† Including arrears of 1909–10.
‡ Includes Munitions Levy.

After the War.—With the termination of the war, taxation in some directions was stiffened, and the revenue continued to expand until it reached the unprecedented figure of £1,425,985,000 in 1920–1. In the 1919 Budget death duties on estates over £2,000,000 were raised to 40% and the tax on the larger incomes was raised slightly, thus hastening the break-up of the historic country estates, which became a feature of the social changes in the post-war period. The tax on beer was raised from £2 15s. 6d. per 36 gal. to £3 10s., and that on spirits from £1 10s. to £2 10s. for proof gallons. It may be explained here that the highest pre-war rate of income tax was 1s. 3d. in the pound, in 1919–20 it was 6s. In 1914 an earned income of £600 paid £18 in income tax; in 1919–20 it paid £75, which shows that roughly the income tax was multiplied by four. A feature of the 1919–20 Budget was the introduction of a form of Imperial Preference. In 1920 a Royal Commission which had been appointed to consider the question of income tax made certain recommendations of reform. Some of these were incorporated in the Finance Act of 1920, whereby a radical alteration was effected in the method of granting relief in favour of earned income, and of the method of graduating the burden of the tax. Exemption from tax was granted to single persons up to £135 (and up to £150 in the case of earned incomes) and to married persons (without children) to £225 (and up to £250 if wholly earned). In arriving at assessable income a person was allowed to deduct one-tenth of all earned income, up to a limit of £200. That is to say, a person with an

*Figures not available.

earned income of £2,000 was entitled to deduct £200, but if the earned income exceeded £2,000 not more than £200 was deductible. On the first £225 of taxable income arrived at after deducting the various allowances provided for—such as one-tenth in respect of earned income, wife and child allowances, insurance premium, dependent relief, etc.—tax was imposed at half the standard rate; namely 3s. in the pound and at 6s. on each pound in excess of £225. Thus the various rates of tax previously in use were abandoned and two rates of tax put in their place. Super-tax was stiffened and regraduated.

The table above shows the aggregate gross liabilities of the State on March 31 in each of the years 1910–21, together with figures of assets, loans to countries allied to Great Britain during the war, and also to the Dominions, and advances for European relief granted after the termination of the hostilities:—

To sum up, the World War cost Great Britain over £10,000,000,000, while if allowance be made for the expenditure of the Dominions the total would be very much greater. An analysis of the expenditure of the United Kingdom from 1688 to 1920 disclosed the fact that in the six financial years from March 31 1914 to March 31 1920, Government expenditure exceeded the total expenditure for the 2¼ centuries preceding 1914. The figures are: for the 226 years 1688 to 1914, £10,044,000,000; for the six years 1914–20, £11,268,000,000. Thirty-six per cent. of this latter sum was paid in revenue, and the remaining 64% was borrowed. The British people provided about £9,900,000,000 out of their own resources towards the six years' expenditure, or £215 per head. Though this vast expenditure was really the outcome of inflationary methods of finance, the system of inflation was not the same as that practised on the continent of Europe but was based on Treasury Bills or Ways and Means advances. These credit instruments were based not upon gold but upon currency notes. Inflation had the effect of reducing the pre-war unit of value: before the war the unit of value was the sovereign containing 123·274 grains troy of gold; in 1920 the unit of value was a paper pound representing no definite weight in gold, but varying in gold value from day to day. (C. J. M.)

ENGLISH HISTORY, 1910–1921 (*see* 9.466–582).—I. BEFORE THE WAR, 1910 12.—At the death of Edward VII. on May 6 1910, he was succeeded on the throne by his only surviving son as George V. (*see* GEORGE V.). The coronation at Westminster Abbey took place on June 22 1911, and was followed by State visits to Ireland, Wales, and Scotland; but an even more important act in the public assumption of Imperial authority was undertaken during the winter of 1911–2 in the visit paid by the King and Queen to India. At the Delhi Durbar (Dec. 12 1912), at which the King was crowned as Emperor of India, His Majesty announced that in future Delhi would replace Calcutta as the capital, and that Lord Curzon's unpopular partition of Bengal would be annulled. No hint of such an impending *coup d'état* as was represented by the latter announcement had previously leaked out, and no single act of Government in the history of the British constitutional monarchy had ever exhibited so strikingly the latent resources of the Throne as an extra-parliamentary factor in Imperial administration. Without sending any communication to Parliament, the home Government had deliberately utilized the King-Emperor's authority to carry out an autocratic act of State policy in India, which otherwise could not have been accomplished without considerable friction.

(For a full account of the action here involved, *see* INDIA.)

It is only right to emphasize the interest attaching, at the opening of the new reign, to the position of the British Throne, as such. In the varied and exacting functions which it is expected to perform, much inevitably depends on the extent to which popular respect and affection surround the royal family. King George was able to benefit, in this respect, from a long growth of public confidence, and from the general acceptance of the theory that, so far as possible, the Crown should be kept out of politics in the party sense. It was all the more important, at King George's accession, that the personal popularity of the royal family should have been unquestionable, because of the political crisis amid which King Edward's death had occurred. Since the Lords' rejection of the budget in 1909 the whole course of domestic politics had been quasi-revolutionary; as between the contending political parties the *impasse* had become complete when the conference of 1910 broke down, and when immediately afterwards the second general election of that year gave the Liberal Government once more a majority. But the Crown remained by universal consent an imperial and social factor of all the more potential value as a moderating influence because of the warring of political factions.

"English" history to-day cannot indeed be written without reference to the British Empire, as a unit greater than is represented by "home" (*i.e.* English, Welsh. Scottish and Irish) politics (*see* BRITISH EMPIRE). The Imperial "idea," to which Mr. Chamberlain's administration of the Colonial Office and the emergency of the Boer War had given such a pronounced impetus, was already progressing with rapid strides at the opening of the new reign both in Great Britain and the Dominions. After 1909, moreover, the question of Imperial Defence had become acute, in consequence of the rapid increase of the German navy and its manifest challenge to British sea-power. The most remarkable incident during the Imperial Conference of 1911 was the confidential discussion of British international policy, at which the Colonial representatives were addressed by Sir Edward Grey with a detailed account of the situation in foreign affairs. For the first time, it was felt, the Empire as a whole had been taken into the counsels of the statesmen of the mother country. A naval defence scheme was adopted, providing for the maintenance of the various naval services and forces under the control of their respective Governments, but for making the training and discipline uniform with those of the fleet of the United Kingdom and for arranging an interchange of officers and men, while in war-time the Colonial ships placed at the disposal of the Crown would be under the British Admiralty. The movement for increasing the Colonial naval forces, as part of an Imperial navy acting as a single unit, was also notably forwarded by the visit to England of the Canadian Premier, Mr. Borden, with other Canadian ministers, in 1912,

for the purpose of discussing the whole subject with the home Government and the Committee of Imperial Defence.

In connexion with the Imperial Conference of 1911 it may also be noted that resolutions were adopted by it in favour of: (1) an Imperial Naturalization Act, based on a scheme to be agreed upon, but still undefined, for conferring an uniform British citizenship throughout the Empire; (2) the appointment (carried out in 1912) of a royal commission, representing the whole Empire, to investigate and report on its natural resources, and the possibility of their development; (3) the establishment of a chain of British State-owned wireless telegraphic stations within the Empire (under the Marconi agreement of 1912).

Parties in Parliament, 1910.

The history of domestic British politics up to the outbreak of war in 1914 continued to be dominated by the state of the parties resulting from the general election which was precipitated in Dec. 1910 when the private conference between the Liberal and Unionist leaders on the constitutional crisis broke down (*see* 20.846, 847). The result of this second appeal to the constituencies showed that the short interval since the general election of Jan. 1910 had made practically no difference in the balance of party power.

The new Parliament opened in Feb. 1911 with a ministerial majority of 122, the combined forces of the Liberals under the leadership of Mr. Asquith as Prime Minister (270), with the Labour party (42) and the Irish Nationalists (84), numbering 396, while the Unionists numbered 274. In the Cabinet, Mr. Asquith, Mr. Lloyd George (Chancellor of the Exchequer), Mr. Winston Churchill (Home Secretary from Feb. 1910 till Oct. 1911 and then First Lord of the Admiralty), Sir E. Grey (Foreign Secretary), and Mr. R. B. Haldane, who was created a peer as Viscount Haldane in March 1911 (War Minister till July 1912, and then Lord Chancellor), stood foremost in dominating the manœuvres of the Liberal party. Behind them in the House of Commons the most prominent members of the Ministry holding major offices were: Mr. Birrell (Irish Secretary since 1907); Mr. John Burns (President Local Government Board since 1905); Mr. Sydney Buxton (President Board of Trade since Feb. 1910); Mr. L. V. Harcourt (Colonial Secretary since Nov. 1910); Mr. Reginald McKenna (First Lord of the Admiralty from 1908 till Oct. 1911, and then Home Secretary); Mr. J. A. Pease (Chancellor of the Duchy of Lancaster from 1910 till Oct. 1911, then Education Minister); Mr. Walter Runciman (Education Minister from 1908 till Oct. 1911, then President Board of Agriculture); Mr. Herbert Samuel (Postmaster-General); Sir Rufus Isaacs (Attorney-General since March 1910) and Sir John Simon (Solicitor-General since March 1910). The Labour party was led by Mr. J. Ramsay Macdonald, and the Irish Nationalists by Mr. John Redmond.

In the Upper House Liberalism had but a small following, under the leadership of Lord Crewe (Sec. of State for India Nov. 1910), but it included Lord Morley (Lord President of the Council, Nov. 1910) and Lord Loreburn (Lord Chancellor since 1905). Lord Rosebery continued to plough a lonely furrow, and Lord Courtney of Penwith to play the part of a political Aristides.

On the Unionist side, Mr. Joseph Chamberlain being physically incapacitated and now only an abiding inspiration to his political followers, Mr. Balfour had no rival as a parliamentary figure. He was loyally supported in the House of Commons by ex-Ministers in Mr. Austen Chamberlain, Mr. Walter Long, Mr. Bonar Law, Mr. H. Chaplin, Mr. G. Wyndham, Mr. A. Lyttelton, Sir R. B. Finlay and Sir E. Carson (leader of the Irish Unionists). In Mr. F. E. Smith, K.C. (afterwards Lord Birkenhead), who had made a rapid and brilliant success both at the bar and in politics, the party had an indefatigable worker and an audacious orator,—a good foil to Mr. Churchill.

In the House of Lords Lord Lansdowne was the recognized Unionist leader, actively supported by such ex-Ministers as Lord Halsbury, Lord Londonderry, Lord Curzon, Lord Midleton, Lord Selborne, Lord Cawdor, Lord Salisbury, Lord St. Aldwyn; and the Duke of Norfolk, Lord Cromer and Lord Milner were other important figures on the same side.

The Unionists were now united by the common bond of resistance to the Radical-Socialist programme of their opponents. The precise form which the tariff-reform policy would take if the party were returned to power was debated according to varieties of opinion on electioneering tactics; but it was sufficient for the moment for those Unionist politicians who had opposed it altogether, or still wavered as to details, to await events. While a protective national economic policy was advocated by the Tariff Reformers as an essential condition of the improvement of industrial and social conditions at home, the Unionist leaders were looking anxiously to the wider Imperial issues beyond the solution of immediate domestic problems. Hopes were still entertained that, either by agreement between the parties or through the failure of the Ministry to obtain the King's consent to actual coercion of the House of Lords, the immediate constitutional crisis might be solved or the Government forced to resign or once more dissolve in circumstances more favourable than before to a Unionist success at the polls.

The Position of the Government.

It was clear from the first that the Government could rely on the support of the Irish Nationalist party. The passing of the Parliament bill was an essential preliminary to the successful accomplishment of Home Rule, and it had been Mr. Redmond's policy ever since the elections of Jan. 1910 to press the destruction of the peers' veto to its final issue for that purpose. The only doubtful element in the situation was the Labour party. Its parliamentary programme included a "Right to Work" bill which the Liberal party could no more support than the Unionist; and having successfully extorted the Trade Disputes Act from Parliament in 1906, it was set on obtaining from the Government a bill for reversing the "Osborne Judgment" and freeing the employment of trade-union funds for political purposes. The fact, however, that the "independence" of the Labour party was dominated by reluctance to put Liberalism in a minority, is so far as it stood for causes with which the Labour party also identified itself, made its parliamentary position one over the manœuvring of which the Government's Whips had the upper hand.

The Parliament Bill.

On Feb. 6 1911, the first Parliament of George V. was opened. On Feb. 21, the Parliament bill was reintroduced in the House of Commons, and had a first-reading majority of 124 next day; the second reading was carried on March 2; and on the 15th the third reading was carried by a majority of 362 to 241, and the bill was sent up to the House of Lords. A few trivial changes had been accepted in its wording, but all the substantial amendments proposed by the Opposition had been negatived. A Labour party amendment to omit the words in the preamble, pledging the Government to set up a reformed Second Chamber, was rejected (May 2) by 218 to 47, Mr. Asquith declaring that the Government regarded it as an obligation, if time permitted, to propose a scheme for reconstituting the Upper House within the lifetime of the existing Parliament.

Every attempt of the Opposition to modify the operation of the Parliament bill was met by dogged resistance. The principal demand of the Opposition, that important constitutional changes should not become law, if rejected by the House of Lords, until they had been submitted to the judgment of the country, was of no avail. The Government's reply was that the country, in giving them a majority, knew quite well what the Parliament bill would be used for, and that the two years' interval it allowed for delay was an ample safeguard against legislation to which the people were opposed.

The Action of the House of Lords.

Meanwhile the alternative policy of the Unionist party was being made clearer in the more congenial atmosphere of the Upper House. A bill proposed by Lord Lansdowne for reforming its constitution was read a second time on May 22. The whole principle of this scheme of reform was that, while the composition of the Upper House would be changed and put on a representative basis, in accordance with the policy of Lord Rosebery's resolutions in 1910 (*see* 20.847), its powers would remain as they

were. Under it, the reconstituted House would consist (except for royal princes) of "Lords of Parliament," summoned as such and not because of any hereditary title; 100 would be elected by the hereditary peers from such among their number as were qualified, under a schedule to the bill, by having held various public positions or ranks in the public services; 120 would be elected to represent different districts of the United Kingdom by colleges of electors consisting of the members of the House of Commons for the constituencies within those districts; 100 would be appointed by the Crown (*i.e.* the Ministry) so as to represent the proportional strength of parties in the House of Commons; seven would be "spiritual lords," *i.e.* the two archbishops and five bishops to be elected by the Anglican Episcopate; and 16 would be peers who had held high judicial office. Except for the law lords, who would sit for life, and the spiritual lords, who would sit while they occupied their sees, the lords of Parliament would sit for 12 years, subject to one-fourth in each class (selected by ballot) retiring every third year. Peers who were not "Lords of Parliament" would be eligible for the House of Commons, but the creation of new hereditary peerages for commoners other than past or present Cabinet ministers was to be limited to five a year. In Lord Lansdowne's view, such a reform of the constitution of the Upper House, which followed on the lines of suggestions already thrown out by Lord Curzon and Lord Selborne, would provide a representative Senate, of which the existing Unionist party preponderance would no longer be characteristic.

So long, however, as the Government flatly declined to accept any reconstruction of the Upper House as a substitute for the Parliament bill, any such proposals were mere beating of the air. The actual scheme excited no particular interest on the Unionist side, and was assailed by Liberals on the ground that, according to their calculations, while pretending to be representative, it would simply stereotype a Tory majority. On the day after it was read a second time, the second reading of the Parliament bill was taken (May 23), and the real issue had to be faced; but the approach of the coronation, and the prevalence of a feeling that, in spite of bellicose utterances in the Liberal press as to the creation of 500 new peers for swamping opposition, the Government might still be forced to a compromise, made the debate still only a manœuvre for position, and Lord Lansdowne decided not to divide against the bill but to propose amendments in committee.

The real fight only began when the coronation was over. The committee stage of the Parliament bill lasted from June 28 to July 6, and, in spite of warnings from Lord Morley that the Government would refuse, in the House of Commons, to accept them, Lord Cromer's amendment (June 28), substituting a joint committee for the Speaker in deciding what a "Money bill" was, and Lord Lansdowne's amendment (July 5), providing for a referendum in specific cases of measures attacking the existence of the Crown, the Protestant succession, or the establishment of national parliaments with legislative powers in Ireland, Scotland, Wales or England, were carried by large majorities. On July 20 the bill, so amended, was read a third time without a division, Lord Lansdowne declaring that the principal amendments were "so essential that we should certainly not be prepared to recede from them so long as we remain free agents." Lord Halsbury went still further: "but for the existence of the amendments, he would have himself moved the rejection of the bill on the third reading, and unless those amendments were accepted in substance, in meaning, and in operation, he would never consent without a division to the passing of the bill."

The Use of the Royal Prerogative.

The next day the Government exploded their bombshell. It had been a mystery up to this moment whether Mr. Asquith had obtained from the King a definite assent to the use of the royal prerogative for creating peers, and the question whether such a course could possibly be resorted to had been freely discussed from the time when the Parliament bill was first proposed. All doubts were now set at rest. On July 21, a letter from Mr. Asquith to Mr. Balfour in the following terms, written the day before, was published:—

I think it courteous and right, before any public decisions are announced, to let you know how we regard the political situation. When the Parliament bill, in the form which it has now assumed, returns to the House of Commons, we shall be compelled to ask that House to disagree with the Lords' amendments. In the circumstances, should the necessity arise, the Government will advise the King to exercise his prerogative to secure the passing into law of the bill in substantially the same form in which it left the House of Commons, and His Majesty has been pleased to signify that he will consider it his duty to accept and act on that advice.

In the subsequent debates in both Houses of Parliament (Aug. 7 and 8) on votes of censure moved by the Unionist leaders, the course taken by the Government was more fully explained. It appeared that the Cabinet had presented a memorandum to the King on Nov. 15 1910, before the general election, as follows:—

His Majesty's ministers cannot take the responsibility of advising a dissolution unless they may understand that in the event of the policy of the Government being approved by an adequate majority in the new House of Commons, His Majesty will be ready to exercise his constitutional powers, which may involve the prerogative of creating peers, if needed, to secure that effect shall be given to the decision of the country. His Majesty's ministers are fully alive to the importance of keeping the name of the King out of the sphere of party and electional controversy. They take upon themselves, as is their duty, the entire and exclusive responsibility for the policy which they will place before the electorate. His Majesty will doubtless agree that it would be inadvisable in the interests of the State that any communication of the intentions of the Crown should be made public unless and until the actual occasion should arise.

The King had felt that he had no alternative except to assent, though he did so, as Lord Crewe now stated, "with natural and legitimate reluctance." The Government had hoped that, as the result of the general election, the Parliament bill would be allowed to pass without amendments which would be fatal to its purpose, and therefore without a disclosure of the confidential understanding which all the time existed as to the use of the prerogative, but this was no longer possible; the only question now was whether the threat was to be sufficient.

The Die-hard Movement.

It was clear that, in the House of Commons, the Lords' amendments would be summarily rejected by the Government majority. The further developments of the political crisis depended, therefore, on what would happen in the House of Lords when the bill was sent back to it. A hurried meeting of Unionist peers was held (July 21) at Lansdowne House, at which Lord Lansdowne informed them that the Government had told the Opposition leaders that their intention was not to send the bill up from the House of Commons unless an assurance was given that it would be passed, the assumption being that, in the absence of this assurance, peers would at once be created in sufficient numbers for the purpose; and it was freely stated in the Liberal press that the Government Whips had a list ready of persons who were prepared to accept peerages on condition that they voted for the Liberal programme. A state of extreme exasperation prevailed, but a considerable majority of Unionist peers agreed with Lord Lansdowne's view that, if this creation of peers were proceeded with, not only would the Parliament bill be passed, but even such opportunities as it left open for subsequent resistance to Home Rule and similar measures would be nullified; the only prudent course, in the interest either of the Unionist party or of the peerage, was to sink further opposition, now that they were no longer "free agents." On the other hand a minority, whose view was strongly expressed by Lord Halsbury, bitterly opposed such a surrender; in their view they did not cease to be "free agents" until they were actually out-voted. It was in this sense that they had understood Lord Lansdowne's use of the phrase on the third reading and it was only on that condition that they had not rejected the bill then. They still regarded the Government threat as a piece of bluff. It was asked whether it could be regarded as certain that, when the 500 eligible magnates who were willing to take Liberal peerages had voted for the Parliament bill, they would not take a more independent view of their position

so far as Home Rule and other measures were concerned. The class of men whom Mr. Asquith was prepared to nominate for the purpose would hardly be different from those who in recent years had been added, quite acceptably, to the House of Lords by Liberal initiation in considerable numbers, and who had in many cases come round there to a different way of thinking.[1] A further argument was that if a creation of peers was avoided now, it would not prevent its being resorted to if the House of Lords subsequently rejected the Home Rule bill.

Between these opposing views of the situation, a cleavage in the Unionist ranks was at once manifest. Mr. Balfour decided to "stand or fall" with Lord Lansdowne's advice, and they were followed by much the larger numbers; but public interest centred in what was known as the "Die-Hard" movement, which was actively organized under Lord Halsbury's leadership and initiated at a largely attended and enthusiastic dinner in his honour at the Hotel Cecil on July 26, at which Lord Selborne presided, supported by Lord Salisbury, Lord Milner, the Dukes of Northumberland, Marlborough, Bedford and Somerset, Mr. Austen Chamberlain, Mr. George Wyndham, Sir Edward Carson, Lord Hugh Cecil, Mr. F. E. Smith, Lord Willoughby de Broke, and other prominent men. How many peers would follow the lead given by Lord Halsbury and vote against the unamended bill when it was again sent up was still uncertain, but as Lord Lansdowne and the bulk of those who accepted his advice were only prepared to desist from further opposition, and would not assist the Government affirmatively by voting for a measure they detested just as much as the "die-hards," it was impossible for him to give Mr. Asquith the assurance he had demanded. A period of extreme tension and uncertainty followed. On July 24, when Mr. Asquith was to move in the House of Commons that the Lords' amendments be disagreed with, he was howled down from the Unionist benches, amid a scene of great disorder, which was repeated next day, and it was not till Aug. 8 that the motion for disagreeing with the Lords' amendments was carried by 321 to 215, after the Government had agreed to introduce a few minor changes. Meanwhile Mr. Balfour had endeavoured to placate the whole of the Unionist party by moving a vote of censure (Aug. 7), which was rejected by 365 to 246, and in the House of Lords a similar vote of censure moved by Lord Curzon (Aug. 8) was carried by 282 to 68.

The Parliament bill was sent up again to the Lords for their acquiescence in the striking-out of their amendments, and the crucial debate there took place on Aug. 9 and 10. In answer to Lord Rosebery, Lord Morley made the precise statement that if the bill was defeated "His Majesty would assent to a creation of peers sufficient in number to guard against any combination of the different parties in Opposition by which the Parliament bill might again be exposed to defeat." This declaration had a marked effect on the result. Up to the last moment the figures on the two sides were in doubt, but the division showed 131 in favour of passing the bill, and only 114 for insisting on the amendments. The Government had won the day by the help of enough votes from peers who usually acted with the Opposition to counterbalance the "die-hards." Thirty-seven Unionist peers, the two archbishops, and 11 bishops voted with the Liberals; but Lord Halsbury's followers were more than had been expected, several peers, including the Duke of Norfolk, joining them in protest against the action of the Unionists who helped to carry the bill. Lord Cromer, who had been active in getting Unionist peers to support the bill on the ground that only in this way could the damage likely to accrue from a creation of new peerages be avoided, was absent through illness; and Lord Curzon's was eventually the most powerful influence exerted in this direction, his action being all the more hateful to the "die-hards" because earlier he had been specially prominent in counselling resistance to the bill at all costs.

The Parliament bill thus became an Act and duly received the royal assent; and a statutory enactment defining the relations between the two Houses of Parliament was substituted for an unwritten British constitution. As compared with the original form in which it was introduced (*see* 20.846, 847), various small drafting alterations were made, including an improved definition of a "money bill," and a more definite exclusion of private bills from the scope of the measure; but the only changes of any substantial importance were the following. (1) A provision by which the Speaker, before giving his certificate (to be endorsed on every money bill sent up to the House of Lords) that a bill is a money bill, "shall consult, if practicable, two members to be appointed from the chairman's panel at the beginning of such session by the committee of selection." (2) Provisions excluding from any public bills, as to which the Lords' consent would not be required after being sent up in three successive sessions, "a bill containing any provision to extend the maximum duration of Parliament beyond five years," and also "any bill for confirming a provisional order." (3) A provision altering the limits of the two years which must have elapsed during the three successive sessions to "between the date of the second reading in the first of those sessions of the bill in the House of Commons and the date on which it passes the House of Commons in the third of those sessions." (4) A provision requiring a certificate signed by the Speaker, stating that the provisions of the Act in this respect had been complied with, to be endorsed on any bill so presented to the King for his assent notwithstanding the opposition of the House of Lords. (5) A provision that "in every bill so presented to the King, the words of the enactment shall be as follows:—'Be it enacted by the King's most excellent Majesty, by and with the advice and consent of the Commons of this present Parliament assembled, in accordance with the provisions of the Parliament Act, and by authority of the same as follows.'"

The bill as passed.

In all vital respects the Parliament Act remained as originally introduced in 1910. Though its preamble declared that reform of the House of Lords itself still remained a task for the future, the supremacy of the House of Commons, both for purposes of finance and for public legislation, was definitely enacted. While the Act, however, on the face of it, made the Government masters of the situation, it was recognized by people who looked a little ahead that in practice it might not work quite as its authors contemplated. In order that its provisions should apply, to the extent of bills becoming law over the resistance of the Lords, these bills had to be sent up in time for two years to elapse during the same Parliament, and during these two years they had to be sent up again and again without being changed from their original form. As the duration of Parliament was cut down to five (practically four) years, this meant that nothing not sent up in the first year or two would benefit by the Act; and apart from that, it would be difficult to avoid changes in bills sent up year after year. Even as regards "money bills," which the House of Lords was now to have no power of rejecting at all, the prospect was uncertain. The Budget of 1909, the rejection of which was the cause of the whole revolution, was probably considered a money bill by most Radical politicians; but the Speaker (Mr. J. W. Lowther) upset any such calculations in Dec. 1911 by ruling, in answer to a question, that the Budget of that year was not a money bill within the Parliament Act—*a fortiori*, therefore, neither was that of 1909.

On the very day that saw the triumph of the Parliament bill (Aug. 10) yet another great alteration was being made in the essential conditions of parliamentary life. Following an invitation already given by Mr. Lloyd George, a resolution was carried in the House of Commons by 256 votes to 158, providing "for the payment of a salary at the rate of £400 a year to every member of the House, ex-

Payment of members.

[1] It is worth noting in this connexion that between 1868 (when modern Liberalism and Conservatism practically started as organized parties) and Oct. 1912, the new peerages created by Liberal Governments numbered 164 and those created by Conservative Governments 149. Mr. Asquith alone had created 52 new peers up to Oct. 1912 since he became Premier in 1908.

cluding any member who is for the time being in receipt of a salary as an officer of the House or as a minister, or as an officer of His Majesty's Household." Most of the Unionists were opposed to the proposal, and a good many Liberals did not like it, but the Government had determined to introduce payment of members as a way out of the difficulty they had with the Labour party, owing to the Osborne Judgment having made illegal the payment of salaries to working-class members out of trade-union funds (*see* 27.143). To legislate in the way the Labour party demanded, so as directly to reverse the Osborne Judgment, was impossible, though the Government were prepared with a bill—unsatisfactory to the Labour party and not proceeded with, a second edition being introduced in 1912—for enabling trade unions to make special provision for voluntary political funds, separately from the general funds to which every member of the union had to contribute; but it was hoped that payment of all M.P.'s out of public money would do away with the particular grievance of the Labour members. In the country generally a good deal of disgust was felt at the calm way in which M.P.'s had voted themselves £400 a year, and some members who were too well-off to want the subsidy declined to take it.

Further complications with Labour were being threatened all this time outside Parliament. Industrial unrest was taking a peculiarly acute and dangerous form. Though trade generally was busy, and "unemployment" steadily diminished,[1] the demand of the wage-earning classes for a proportionately larger share of the good things of life—better pay and less work for it—had become more articulate and better organized. Socialist—and particularly "Syndicalist"—theories had for some time been getting a strong hold of the younger generation of trade unionists; and a growing sense of the impotence of the Labour members in Parliament, added to increasing suspicion that Liberals and Tories alike were in league with the "money power," encouraged the idea that "direct action" by means of strikes was the only way of successfully asserting the claims of the operatives to a larger share of the profits of industry. The fact that wages, under existing agreements, practically remained stationary, while the cost of living, owing to higher prices, was going up, gave a solid basis for discontent. The result was seen, not only in numerous local conflicts between Capital and Labour, but in the threat of more extended "general" strikes, which aimed at holding up whole industries throughout the country and compelling parliamentary intervention.

Labour "Unrest."

For the first time in the history of English labour troubles a "national" strike was precipitated in 1911, and private war was made on the whole community by the members of the railway unions. Since 1907 there had been a continual agitation among members of the Amalgamated Society of Railway Servants for better wages and shorter hours, and for "recognition" of their trade union by the railway companies, which had been steadily refused by all except the North Eastern Company (after an arbitration in 1897). A general railway strike was only averted in 1907, as the result of negotiations carried on by Mr. Lloyd George as president of the Board of Trade, by an agreement between both sides to accept a scheme of conciliation and arbitration proposed by him. But the actual working of the conciliation boards then set up proved very disappointing to the railwaymen; and the movement came to a head again in Aug. 1911. Strikes had been going on in Liverpool, Manchester, London and elsewhere, among various other classes of transport workers—seamen, dockers and carters. In London a violent dock strike was only terminated early in Aug. by an award of Sir Albert Rollit, increasing wages; and a carmen's strike, which had been accompanied by serious disorder and had driven the Government to order troops from Aldershot, was brought to an end with considerable difficulty at the same time by the intervention of the Board of Trade, the men securing concessions both as to hours and wages. At Liverpool a protracted dock strike had driven the ship-owners on Aug. 3 to agree to "recognize" the Dockers' Union and make other concessions; but a number of strikers refused to go back to work; and the ship-owners then announced a general lock-out to begin on Aug. 14. The answer of the dockers' strike committee, led by Mr. Tom Mann, was to call on all transport workers to assist them by striking in sympathy, and wild scenes of rioting resulted, requiring the introduction of troops to help the Liverpool police. The general unrest now spread in an active form to the railwaymen too. At Liverpool the goods porters at the Lancs. & Yorks. stations struck on Aug. 5 because of the delay in dealing with their grievances, and at other stations the men came out in sympathy. On Aug. 15 the joint executives of the four railwaymen's unions—Amalgamated Society of Railway Servants, Associated Society of Locomotive Engineers and Firemen, General Railway Workers' Union, and Signalmen's and Pointsmen's Union—decided to order a general strike unless in 24 hours the companies agreed to meet them and discuss terms. The companies at once refused to do so, or to admit that the conciliation scheme of 1907 could be thrown over in this way. The leaders of the men on the other hand contended that the spirit, if not the letter, of the agreement of 1907 had never been carried out, and that they must have direct recognition of their unions. The machinery of the Board of Trade was set to work to try to delay a rupture, but meanwhile the companies were guaranteed military protection, and preparations were made for placing soldiers along the lines.

Railway Strike, 1911.

On Aug. 17 Mr. Asquith had an interview with the men's representatives, and offered a royal commission to inquire into the working of the conciliation scheme, but at the same time he warned them gravely and firmly that the Government could not allow the railway service of the country to be paralysed. Resenting the tone of his speech, and suspicious of a royal commission as simply a means of shelving the whole matter, they refused this offer and ordered the strike, which began next day in spite of continued efforts by Mr. Lloyd George (Mr. Asquith having left further action to him) to overcome what seemed to be a misunderstanding. As the result of his explanations to the men's leaders negotiations still went on; a vote of censure on the Government which the Labour party at first decided to move in the House of Commons was not proceeded with; and instead of Parliament being adjourned on Aug. 18 until the autumn session, as had been arranged, it was decided to meet again on Aug. 22 in order to deal with the situation. The strike was in actual operation for practically two whole days and did not terminate till Aug. 20. On the 19th, however, a settlement was effected. It was agreed that a special commission should at once investigate the working of the conciliation scheme and report quickly what changes were desirable, and that the trade-union leaders should persuade the men to return to work, the strikers being reinstated. The special commission started work on Aug. 23 and took evidence from both sides up to Oct. 3, its report being issued on Oct. 20. It was unanimously recommended that the conciliation scheme should be amended in various ways, the central board being abolished and any differences within the sectional boards being settled by an independent chairman chosen from a panel drawn up by the Board of Trade; trade-union "recognition" by the companies was not directly conceded—the commissioners pointed out that the companies could not permit intervention on the subject of discipline and management—but some satisfaction was given in this direction by a recommendation that the men should have anybody they wanted (*e.g.* a trade-union official and not actually an employee) on the sectional boards as their secretary and advocate. The Labour party and trade-union leaders were by no means satisfied, however, with the result of the commission. The union leaders decided to take a ballot in Dec. on the question whether the findings of the commission should be accepted or another strike for "recognition"

[1] The only official figures for "unemployed" issued by the Board of Trade were for the trade unions. In these the percentage, which was 9 in 1908 and 1909, fell to 5 in 1910 and 3 in 1911.

started; and when the report of the commission came up for discussion in the House of Commons on Nov. 22 the situation was still a very difficult one. A resolution was moved by Mr. Lloyd George asking the Government to bring about a further meeting between the representatives to the agreement of Aug. 10; but this was only carried after a contentious debate displaying obstinacy on both sides, Mr. Ramsay Macdonald insisting that the men had not agreed to accept the report and that "recognition" was indispensable, while the view of the companies was that the Government ought to hold the report as binding on both parties. It was not till Dec. 11 that, after a good deal of diplomacy on the part of the Board of Trade officials, a compromise was arrived at. Both parties agreed to accept the report of the commission as a basis for modifying the future working of the conciliation scheme, "recognition" being accepted to the extent of allowing the men to have their trade-union secretary as adviser. Various concessions as to wages and hours were also made by the companies.

As regards the strike itself, while in actual operation, the state of the railways during those two or three days was unprecedented. Some 220,000 men altogether, about a third of the workers, were out, and traffic was much restricted, the worst dislocation being in the N. of England, round Liverpool and Manchester. Troops were employed freely to guard the lines and give protection against violence, and in consequence there were only certain particularly disturbed districts where serious mischief occurred. On Aug. 10 an attack was made by rioters on a train at Llanelly, and the soldiers had to shoot, two men being killed, while an explosion due to the mob setting fire to some trucks containing gunpowder resulted in five more deaths; and at Liverpool, on the 15th, two men were shot in a riot. The employment of the military was furiously denounced by the Labour agitators, but the intimidation practised against non-unionists and the danger of extended sabotage were such that, on the whole, the comparative peaceableness of the stoppage, which occurred in a summer of unexampled heat, was rather remarkable. To a great extent, and particularly on the lines nearer London, this was due to the fact that a large proportion of the union men who went out (a certain number remaining loyal to the companies) only did so because they dared not disobey the union orders. One outcome of the railway strike, and of the general unrest of which it was a symptom, was an addition made by the Government to the official machinery applicable at the Board of Trade to the working of the Conciliation Act of 1906. In Oct. 1911 an Industrial Council, representative of employers and workmen, was instituted as a permanent body for considering and inquiring into matters referred to them concerning trade disputes, and for taking suitable action (but without any compulsory powers) on the same lines as the conciliation boards already adopted in particular industries. As chairman of this Industrial Council and "Chief Industrial Commissioner," the Government chose Sir George Askwith (b. 1861), head of the Labour Department of the Board of Trade, who had just been knighted in recognition of the valuable work he had done in recent industrial conflicts.

The Insurance Act.

Meanwhile the National Insurance bill, introduced into the House of Commons by Mr. Lloyd George on May 4 1911, had brought new issues into the parliamentary conflict. This elaborate measure covered two distinct subjects, one being national health insurance, under newly constituted insurance commissioners for England, Wales, Scotland and Ireland (with a joint committee, formed from among them, for adjusting common affairs), assisted in each case by an advisory committee, with county and county borough committees for local administration, and the other unemployment insurance, directly under the Board of Trade.

(1) Unemployment insurance, administered largely through the labour exchanges, was applied to certain trades—building, construction of works (railways, docks, etc.), shipbuilding, mechanical engineering, iron-founding, construction of vehicles and saw-milling—with power for the Board of Trade to extend the scheme to others. Workmen in these trades (others than foremen, clerks, indentured apprentices, and persons under 16) would be entitled under various restrictions to unemployment benefit (up to a standard of 7s. a week for not more than 15 weeks a year, starting at the second week of unemployment), out of an unemployment fund formed by each workman compulsorily contributing 2½d. a week (paid by employer and deducted from wages), employers 2½d. a week per man, and the State adding an amount equal to a third of their total contribution.

(2) For national health purposes, compulsory insurance was imposed on all persons (between 16 and 70) under contracts of service, with certain exceptions (including those employed otherwise than in manual labour, and paid over £160 a year, or possessing £26 a year from property), provision being also made for certain classes of employed persons to come into the scheme as voluntary contributors. Under the compulsory insurance (except for certain lower rates) male contributors were to pay 4d. a week, female 3d. (employers making the payments and deducting them from wages), and employers 3d. for each male or female employed (special stamps for each amount having to be affixed to cards for this purpose), the State adding to the National Health Insurance Fund an amount (two-ninths in the case of men, and one-fourth in the case of women, of the cost of benefits and administration) reckoned at 2d. a week per head. The benefits primarily secured were (i.) free medical treatment at home; (ii.) sanatorium treatment for tuberculosis and other diseases specified by the Local Government Board, the Government allocating £1,500,000 for the building of sanatoria; (iii.) payment during sickness of 10s. a week for men and 7s. 6d. for women up to 26 weeks; (iv.) subsequent payment during disablement of 5s. a week, and (v.) maternity bonus of 30s. to women (including wives of insured persons) on confinement; provisions being made for granting these benefits (medical attendance, sickness, and maternity benefits not till six months, disablement not till two years after payments started) or modifying and extending them as funds permitted. The agencies for administering the benefits were made (i.) "approved societies," *i.e.* the Friendly Societies, trade unions and such similar bodies as the insurance commissioners approved, the intention of the Government being to have as many as possible of the insured included as members of "approved societies"; (ii.) the post-offices, which would deal with those who would not join societies or whom societies would not admit, and who thus became "deposit contributors." The local health committees, among their other duties (including the administration of sanatorium benefit), were left to arrange for the service of medical practitioners for insured persons, preparing lists of doctors from among whom the patients were to have their own choice, payment to the doctors from the general fund being estimated for at the rate of 6s. (including cost of drugs) per head per annum. This feature of the bill, as explained by Mr. Lloyd George, quickly aroused the opposition of the doctors, who were organized under the British Medical Association to refuse their services unless a larger payment was made; and as a body the doctors stood out for better terms. As medical "benefits" under the Act became due on Jan. 15 1913, it became a question for the Government whether, if no terms could be arranged, a regular State medical service would not have to be started. On Oct. 23 1912 Mr. Lloyd George announced the Government's "final" offer to increase the capitation fee to 9s. (including drugs and extras); but on Nov. 19 the offer was rejected by an overwhelming majority of the profession at a representative meeting of the British Medical Association.

The second reading of the Insurance bill was carried without a division on May 29, and the committee stage went on intermittently from July 5 to Aug. 4, when, with the discussion on the 17th clause finished, Mr. Lloyd George was still able to regard the Opposition as favourably disposed towards the bill. Its remaining stages were then left over for the autumn session, which began on Oct. 24. But in the interval opposition had been growing, and the political situation in other respects was such that genuine coöperation with anything proposed by the Government was hardly possible if party capital could be made for the Unionists by what was unpopular in its programme. Not only were the doctors in full revolt against the terms proposed for their remuneration, but the working classes themselves were found to dislike exceedingly being taxed for benefits they were not able to appreciate. Mr. Lloyd George, ever an ardent electioneer, exasperated the Unionist party by his description of the bill as giving the working classes "ninepence for fourpence." Among domestic servants the scheme was cordially disliked. Though the bill was planned so as to involve financial coöperation between the State and the Friendly Societies, there was considerable uncertainty, moreover, as to how far a great many of the latter, especially the smaller local societies, would reap advantage rather than loss. Public discussion concentrated on the difficulties and objections. It was inevitable therefore that, so far as the political aspects of the bill were concerned, the attitude of the Opposition should be affected by the discovery of its wide unpopularity.

Insurance Act passed.

The result was unfortunate for a scheme which aimed at accomplishing so important a work of social reform. The Government had its programme for 1912 full, subject to, the way being cleared by the Parliament Act, by the political necessity of proceeding with Home Rule and Welsh Disestablishment; and Mr. Lloyd George, whose influence on the parliamentary tactics of the Coalition was now supreme, determined to force the Insurance bill through before 1911 ended. When the House of Commons resumed on Oct. 24 Mr. Asquith carried a time-table resolution for closuring the remainder of its stages; and by this drastic method the bill passed through committee on Nov. 21 and was read a third time on Dec. 6. Under such conditions the opportunity for effective Opposition criticism and amendment was so limited that very little was possible, in spite of the activity of Mr. Worthington Evans and other Unionist members, and towards the end it became a question whether the Unionist leaders would actually divide against the third reading, a course to which they were openly challenged by Mr. Lloyd George. Instead of this, an Opposition front bench amendment was moved by Mr. H. W. Forster, proposing that the bill should be postponed for further discussion, and this was defeated by 320 to 223, the third reading then being carried in a division in which the Opposition as a whole took no part, 21 members recording their votes against it. On Dec. 11 the bill was read a second time in the House of Lords, and, after various Government amendments had been inserted in committee on Dec. 14, it was passed and received the royal assent next day, when Parliament was prorogued.

Public discontent.

During all this time, both inside and outside Parliament, opinion as to the scheme and its prospects had become more clearly crystallized. While Mr. Lloyd George and his supporters proclaimed it to be the most beneficial reform ever conceived in the interest of the working-classes, and taunted the Opposition with attempting to destroy it, the Unionists dwelt on the injury done by forcing through a measure which ought to have been more carefully considered before it became law, and threw the responsibility on the Liberal party for everything that was objectionable and unworkable in it. The by-elections showed that its unpopularity was continually growing; and under the arrangement made in the Act, that the insurance commissioners should during 1912 make regulations as to details, nobody knew yet what procedure would be adopted to overcome countless points of difficulty which under the Act itself remained quite unsettled. The medical profession, without whose co-operation, so far as could be seen, the Act would not work at all, continued to refuse it unless they were given better terms, to which Mr. Lloyd George was still unable to agree; and "passive resistance" was organized on their behalf by the British Medical Association.

Mr. Balfour's resignation.

It was, however, not only the stimulus given by the antagonism to the Insurance Act that was causing a revival of Unionist confidence after the defeat over the Parliament Act. During the autumn session of 1911 the Unionist party had started afresh under a new leader in the House of Commons. The "die-hard" revolt had been a final illustration of the dissatisfaction within the party at the way it had been led by Mr. Balfour for some time past. Had the Parliament bill been defeated in the House of Lords by the "die-hards," it was an open secret that both Lord Lansdowne and Mr. Balfour intended to retire from their positions at the head of the party, and it was largely the dislike of acting disloyally by them that confined the open revolt to a comparatively small section. Exasperation at the result, however, was general. Mr. Balfour himself did his best to smooth matters over, declaring in a public speech (Haddington, Oct. 7) that the question of the peers' tactics was now a dead issue, of no more practical importance than the controversy as to the identity of Junius; and the "die-hards," though they started a Halsbury Club and kept their organization in being, protested at the same time that the differences within the party were ended with the cause of them, and that they only meant to work for the common good. But after some weeks of reflection, when the hubbub was all over, Mr. Balfour made up his mind that the right moment had arrived for him to retire from the leadership, though not from Parliament, in view of the arduous political struggles still impending, and the unlikelihood of his being strong enough in health, should the Unionists again return to power, to conduct a ministry. His announcement to this effect was made on Nov. 8, at a hastily convened meeting in the City of London. For a few days the question of who would succeed him was uncertain. Mr. Austen Chamberlain, not only as principal leader of the Tariff Reformers and one whose very name would, on his father's account, be most representative of the Imperialist movement, but as ex-Chancellor of the Exchequer and officially Mr. Balfour's deputy on the Opposition front bench, had apparently the strongest claim; but, as a Liberal Unionist, his selection was opposed by many Conservatives, who considered Mr. Walter Long a better choice; and Mr. Long's great popularity among all sections was much in his favour. It became clear to the partisans of both that if either were proposed, and votes were taken, it would only emphasize the division of opinion and create friction between their supporters.

Mr. Bonar Law, the new leader.

It was found that Mr. Austen Chamberlain and Mr. Long were both prepared to stand aside in favour of Mr. Bonar Law, nominally a Conservative and at the same time a strong Tariff Reformer; and on their joint proposal he was quickly adopted as leader in the House of Commons (Lord Lansdowne continuing to be leader in the House of Lords), at a party meeting on Nov. 13. Their sacrifice of personal ambition set an example which did much to promote fresh confidence within the party; and Mr. Bonar Law had no sooner become leader than there were signs of improved Unionist prospects in the constituencies. In intellectual range, subtlety of exposition and criticism, and political experience, Mr. Balfour had, admittedly, no rival on either side, but he still remained in the fighting ranks, ready to devote himself to the Unionist cause as much as anybody. His retirement from the formal responsibilities of leadership gave freer play to the respect and admiration felt for him personally as a public man, while relieving the party of the accumulation of doubt as to his policy and tactics, which, rightly or wrongly, had led to undercurrents of dissension. To the plain man his detached and philosophical outlook on public affairs had been rather too lofty; to be "had" or tricked, as the party was openly taunted with being by its opponents, over the Budget of 1909 or the Parliament bill of 1911, simply meant that its leader had failed in astuteness; ardent Tariff Reformers, enthusiastic for Mr. Chamberlain's policy and pining for Mr. Chamberlain's aggressive tactics, felt that Mr. Balfour's balancing support of their proposals was unpractical and was confined to economic generalities. He was perhaps "too much of a gentleman" as well as "too little of a business man" for the situation. Mr. Bonar Law, on the other hand, was more of the Chamberlain type—a successful man of business, the clearest and most convincing platform exponent of Tariff Reform, a speaker who was accustomed to calling a spade a spade.

Reciprocity in Canada.

It so happened that the result of the Canadian elections at the end of Sept., and the defeat of Sir Wilfrid Laurier's American Reciprocity proposals, had delighted the Unionists and given them fresh confidence for the future of Imperialism. Canada had shown that she meant to keep her place in the Empire, and that antagonism to the prospect of becoming simply an annexe to the United States was more powerful than the temptation to secure immediate commercial advantages from reciprocity. Up to the last the result of the Canadian elections had been very uncertain, and the Tariff Reformers in England, who had been thoroughly depressed and disheartened by the idea that, if reciprocity between Canada and the United States were established, their hopes for Imperial commercial union would be frustrated, had in Mr. Borden's success a legitimate

triumph for their own views of Imperial policy. Imperial patriotism in Canada had averted the greatest danger yet threatened, in spite of the support given by the Liberal Government at home and the British Ambassador at Washington. Every platform rang with Unionist rejoicings, and the Canadian victory put new heart into the Tariff Reform propaganda.

On yet another question of Imperial moment a rebuff was given to the ministerial policy. Throughout 1911 the decision of the Government to ratify the Declaration of London had led to a prolonged agitation. Most of the Unionist party, together with a strong body of naval opinion, were actively opposed to it, their argument being that under its provisions the advantages of British supremacy at sea in war time would be seriously diminished. The Government succeeded, however (June 1 1911), in obtaining the support of the Imperial Conference, considerable weight attaching to Sir E. Grey's view that adhesion to the Declaration would be advantageous in Great Britain's foreign relations and to the cause of peace. As Parliament had no direct control over the action of the Government in the matter of ratification, political opposition centred on the Naval Prize bill which was introduced to carry out the provisions of the Declaration of London, the second reading being taken on July 3. So much headway was made in arousing antagonism to the Declaration itself that when the third reading of the Naval Prize bill came on in the House of Commons on Dec. 7 the Government only managed to get a majority of 47; and the House of Lords promptly rejected the bill.

The Naval Prize Bill.

The Government were meanwhile being perpetually worn and worried by the militant agitation for women's suffrage and by the difficulty of dealing with any legislation on the subject when the Cabinet was divided. The Prime Minister himself was avowedly opposed to women's suffrage altogether. On the other hand, Mr. Lloyd George, while professing himself a strong supporter of the cause, which was also advocated by Sir E. Grey and Lord Haldane, objected to any bill which was not thoroughly "democratic"; and because the "militants" regarded his attitude as obstructing the particular measure which they had in view, and held him responsible for a Government bill not being introduced as they desired, he was pestered as much as if he had actually been an open opponent like Mr. Asquith. The so-called "Conciliation" bill, introduced by Sir G. Kemp, which assimilated the parliamentary to the municipal franchise for women and would give votes to about a million, had been read a second time in the House of Commons on May 5 1911, Mr. Asquith himself pairing against it while Mr. Lloyd George and other ministers supported it; and as there was no time for proceeding with the bill in 1911 the Government promised to give it "facilities" in the following year. But while the various sections of supporters of women's suffrage disputed about its prospects, and the "militants" raged together, Mr. Asquith suddenly made a new turn on Nov. 7 by announcing the intention of the Government to add to its programme a Franchise Reform bill on the lines of Manhood Suffrage. In answer to a deputation of woman suffragists on Nov. 17 he declared that, while he was personally opposed to women's suffrage altogether, this bill would be so drawn as to admit of amendment to include women on certain terms; and if an amendment, which the Government as such would not oppose, were carried, the Government would then adopt it. They would also, as had been promised, give facilities for the Conciliation bill.

The Franchise Question.

It had been generally supposed that the Government would take advantage of the passing of the Parliament Act to reintroduce the bill against plural voting which the Lords had rejected in 1906, but this larger measure was totally unexpected, and the announcement was widely construed simply as a device for "dishing" women's suffrage. It was at once denounced for that reason by the "militants" who began to make more trouble than ever. From this moment the internal divisions within the Cabinet on the subject of women's suffrage, and the necessity of taking administrative action against "militant" violence, remained a source of constant difficulty. When eventually, on March 28 1912, the Conciliation bill was rejected by 222 to 208, owing to disgust at "militant" tactics, the prospect of legislative action rested entirely with the question of an amendment of the Government Franchise bill, which was read a first time on June 17 1912, by 274 to 50, and a second time on July 12, by 290 to 218. In other respects this bill, which abolished plural voting and university representation, made six months' residence by adult males the only qualification for votes, and did away with existing restrictions as to registration, handing it over for automatic action by the municipal authorities, excited comparatively little public interest. There did not seem likely to be time, even if there were inclination, to pass it into law before the session ended. The Unionists, while objecting to details, opposed it mainly on the old ground that redistribution should accompany reform; while the Liberal rank and file, who for their own electioneering purposes were principally anxious to destroy the plural vote, felt that a simpler measure with that object would have sufficed. A bill to abolish plural voting, introduced by a private member, Mr. Baker, was read a second time on March 1 1912.

The main problem, however, before the Government when Parliament met on Feb. 14 1912, was Irish Home Rule, with Welsh Disestablishment and Disendowment in a secondary place. The main interest of the latter measure, keenly as it was opposed in the interests of the Church of England, lay naturally in the financial provisions. The income of the Welsh dioceses in 1906 was £556,000 (£296,000 representing voluntary contributions which would be unaffected), and of the £260,000 derived from endowments the bill would take away £172,500, representing (according to the Liberal view) national property; but this reduction would only be gradually effected in about 40 years by the Welsh commissioners appointed to manage the transfer—existing interest being maintained and existing incumbents being paid their present stipends—so that in that time the Church would have the chance of making good the loss of income by increased voluntary contributions. The disestablished Church was given power to set up a representative body; and to this body the Welsh commissioners would hand over the cathedrals, episcopal palaces, churches and parsonages, and also the modern endowments—and such part of the glebe as was not considered to be part of the ancient endowments—to which the Church as such was strictly entitled; as a dividing line the date of 1662 was taken as that after which property of uncertain origin now owned by the Church might be regarded as her own. The funds which by degrees would be taken from the Church were to be applied partly to charitable and public purposes by being handed over to the county councils and partly to the university of Wales (library, etc.).

Welsh Disestablishment.

The rather moderate extent of the disendowment thus proposed was somewhat of a surprise. Extreme Liberationists had to console themselves with the prospect of a success for the principle of disestablishment rather than any considerable acquisition of Church property for secular purposes. On the other hand, from a Church point of view, the smallness of the operation on its financial side made the whole transaction seem one of peculiar meanness; for a paltry result, the work of the Church—admittedly now well done, as had been proved before the Welsh Church Commission, whatever its shortcomings in the past—was to be crippled and hampered. Defenders of the Church could point to the fact that it was the largest single religious body in Wales, and the only one which was represented in every parish by a regular organization. The ecclesiastical indivisibility of Wales and England was a more fundamental objection, the Welsh dioceses being from the Church point of view an integral part of the Church of England. The case for the Government, granted the principle of disestablishment at all, was, however, fairly simple. Their precedent was the case of the Irish Church in 1869: it was equally a part of the Church of England, and disestablishment and disendowment had done it good rather than harm. The answer to those who con-

tended that the Church really was the national Church of Wales was that the Welsh people thought otherwise; at election after election, almost unanimously so far as political representation showed, they demanded the change as an act of justice. On the first reading of the bill (April 25), which was carried by means of the closure by 331 to 253, Mr. Lloyd George emphasized this point in a somewhat rhetorical plea for the right of his own nationality to have the religion it chose and not to be nationally misrepresented by a Church which, however well it worked, was English and not Welsh. On May 13 the second reading opened with a slashing criticism from Mr. F. E. Smith, but on the 16th it was carried by the closure by 348 to 267, and the bill was then hung up till the late autumn. Its introduction satisfied the Welsh party, but otherwise it excited no real parliamentary enthusiasm. In recent years disestablishment had ceased to interest any large section of Liberal politicians; and the bill, while alienating many Liberal churchmen and rallying to defence of the Church numbers of voters who are normally indifferent to political issues, was not of a nature to help Liberal or Labour electioneering outside Wales itself.

In making an Irish Home Rule bill their chief measure in 1912 the Government were more fortunate in one respect than Mr. Gladstone had been in 1886 and 1893, when the whole Irish question was still associated in Great Britain with the prejudice and hostility aroused by the agrarian war, with all its incidents of cattle-maiming and boycotting, the "plan of campaign," the Phoenix Park murders and dynamiting outrages, the downfall of Parnell and the split in the Nationalist ranks (*see* IRELAND). A new generation had grown up, to whom all this was ancient history, with no special application to the existing conditions. Ireland for years had been peaceful and growing in prosperity; the Unionist Government had given her both local government and the Land Purchase Act; and the idea of Home Rule (as apart from the forgotten Home Rule bills) was now familiar simply as one of the standing issues of party politics. Lord Rosebery's defection had not prevented Sir Henry Campbell-Bannerman from inscribing it again in 1905 on the banner of the Liberal party; and though the Liberals then came into power, independently of the Nationalist vote, under a pledge not to introduce a Home Rule bill during the 1905–10 Parliament, Mr. Asquith had been quite explicit in saying, when the elections of Jan. 1910 were taken, that if he got a majority this self-denying ordinance would be at an end. It was true that at the elections of Dec. 1910 neither Mr. Asquith nor his colleagues in the Cabinet made Home Rule a direct issue either in their election addresses or in their speeches. On the contrary, when the Unionists warned the electorate that in voting for the Parliament bill they were voting also for Home Rule, they were constantly told that this was only a "bogey." But the fact remained that Home Rule was an integral part of the Liberal programme, and within the Government forces returned as supporters of the Parliament bill the Irish Nationalists held the balance of power. Mr. Redmond, for his part, had been perfectly frank about the conditions of his support; on Sept. 27, 1910, for example (to give only one instance out of many), at a moment when it was still uncertain to what lengths the Liberal Cabinet would go in framing a Home Rule bill, he was reported as saying in a speech at Buffalo, U.S., "I believe the leaders of the Liberals are sincerely friendly to Home Rule, but, sincere or not, we have the power and will make them toe the line." The real strength of his position for making a good bargain over the terms of the bill was based, however, on the willingness of the Liberal and Labour parties to concede, in all essentials, the Nationalist demand, representing as it did not only a solid vote from three-quarters of Ireland but also an important body of Irish opinion in America and the British colonies. Apart altogether from the older arguments for Home Rule, the Liberals justified their policy by the success attending their grant of self-government to the Transvaal, and by the congestion of business in the Imperial Parliament, which in any case made it desirable to move in the direction of devolution. An Irish Parliament and executive of the colonial type for purely Irish affairs, subordinate to the Imperial Parliament, would not only satisfy the Irish claim, but might be the beginning of a federal scheme for the whole of the United Kingdom. Arguing on these lines,—and Mr. Redmond carefully put the Irish case no higher in his speeches before British audiences—it was much easier in 1910 and 1911 for supporters of the Government than it was in 1886 and 1893 to scout Unionist objections to the principle of Home Rule; they could even appeal to Unionist arguments in favour of an Imperial federal constitution. English Liberal Noncomformists were not now so much agitated about Home Rule meaning Rome Rule; and public opinion in Great Britain generally had become rather apathetic about Ireland altogether, being to a large extent out of touch with its problems. It was only in Ulster that passionate resistance was as yet reawakened.

Home Rule.

Mr. Asquith introduced the Government of Ireland bill in the House of Commons on April 11 1912. He laid particular stress on its being intended to be the first step towards parliamentary devolution and a system of federalized parliaments within the British Isles, and on its maintaining the supremacy of the Imperial Parliament at Westminster over the new Irish Parliament equally with any that might later be set up in other divisions of the kingdom. The essence of the bill was that in Ireland an Irish Parliament and Irish executive should be responsible for exclusively Irish affairs. Instead of saying precisely what these affairs were, the bill specified what were the Imperial affairs which the Irish Government could not deal with, including certain Irish matters (Clause 2) "reserved" to the Imperial Government. There would be two Houses—an elected House of Representatives of 164 members (of whom, on the existing basis, 39 would probably be Unionists); and a nominated Senate of 40 members, on which Mr. Redmond's view was that there would thus be the opportunity to secure the inclusion of Irish public men of eminence, without reference to their party colour. In case of a conflict between the two Houses they would sit and vote together. For Imperial purposes Ireland would still be represented at Westminster, but only by 42 members, subject to a special provision (Clause 26) for increasing this number in case the question of altering the financial relations should arise at some future time and purely for that purpose. The acts of the Irish Parliament would be subject to veto or postponement by the Imperial executive or Parliament, disputes as to their validity being adjudicated on first by the Irish Court of Appeal and secondly by the Privy Council. It might not enact privilege or disability, endowment or deprivation, for any form of religion, or make any religious belief or ceremony necessary to the validity of marriage. Irish taxes would be settled by the Irish Parliament but would continue to be collected (together with such Imperial taxes as remained) by the Imperial Government, and an annual sum corresponding to the cost of Irish services at the time of the passing of the Act would be "transferred" to the Irish Exchequer under the administration of a Joint Exchequer Committee, together with a grant, beginning at £500,000, to be reduced as circumstances permitted; practically this meant an annual subsidy of £2,000,000 from the Imperial Exchequer. The "transferred sum" would provide a security on which the Irish Government could raise loans. The financing of Old Age Pensions, National Insurance, the Post Office Savings Bank, and the Royal Irish Constabulary, was reserved temporarily to the Imperial Exchequer, but the Irish Post Office (with the patronage attaching to it) was made a separate service under Irish administration. The powers given to the Irish Parliament to deal with Customs and Excise as well as other taxation contemplated the setting-up of Irish custom-houses independently of Great Britain, and (within certain limits) the possibility of varying duties as between goods imported into Ireland or into Great Britain; and as the collection was to be made by the Imperial Government, and allowance for the Irish levy to be made to the Irish by the Imperial Exchequer,

Home Rule bill, 1912.

the procedure was necessarily rather complicated. The finance of the bill was indeed admittedly and necessarily provisional, complete data being unavailable, in spite of the Government's having had the advice of a committee of financial experts, whose report, however, was not disclosed. For 1912–3 it was estimated that the revenue derived from Ireland was £10,830,000, and the expenditure there £12,354,000, showing a deficit of £1,515,000. In the next ten or fifteen years a further increase in the deficit was contemplated, bringing it up to over £2,000,000. The subsidy now proposed was estimated accordingly.

Ulster's Opposition.

Even before the introduction of the bill it had been seen that the greatest practical difficulty in the way of Home Rule, irrespective of controversy over particular details in the scheme, would be the attitude of Unionist Ulster. Under Sir Edward Carson's leadership, opposition was already being organized in 1911, on behalf of the N. of Ireland Protestants and Orangemen, which, it was openly avowed, would if necessary go to extreme lengths, even to a refusal to recognize a Parliament in Dublin[1] and to the setting-up of a separate "provisional government." The anxiety of the Government to counter this movement as far as possible had been shown early in the session by the announcement that Mr. Winston Churchill was going over to Belfast to speak on Feb. 8 in the Ulster Hall, and violent opposition to the proceeding was at once taken in hand there. It was considered on the Unionist side that for the son of Lord Randolph Churchill, who had said that "Ulster would fight and Ulster would be right," to preach Home Rule in a place associated with the campaign against it, was an outrage; and the leaders of the Ulster Unionist Council took steps to make the delivery of the speech in the Ulster Hall impossible. Eventually its engagement for the purpose was cancelled, and it seemed for the moment that the prospects of rioting and bloodshed if Mr. Churchill appeared in Belfast at all were so serious that the Government would be obliged to keep him away. Mr. Churchill, however, was not to be daunted. Arrangements were made for the speech to be delivered in a pavilion in a field outside the city, and for troops to be drafted there in large numbers for the maintenance of order. The apparent denial of free speech at all on the Ulster Unionist side was severely commented upon elsewhere, and justified with some misgivings by English sympathizers, but when the leaders had been successful in defeating the plan for holding a Home Rule meeting in the Ulster Hall they went no further. Mr. Churchill duly arrived and made his speech, dwelling particularly on the safeguards which the Home Rule bill would contain against anything to which Ulster could object; but the city was in a ferment of dangerous antagonism and he had to be smuggled away afterwards to avoid the hostility of the crowd. Actual rioting was avoided, and peace was kept between Nationalists and Loyalists, at the cost of £2,730 for the expense of the troops engaged, the Ulster leaders having eventually devoted themselves to keeping their supporters well in hand; but the whole incident was an unpleasant revelation of the rebellious spirit that was being aroused. A little later (April 9) Mr. Bonar Law was present at a great demonstration at Belfast, the special note of which was a solemn pledge of Loyalist resistance.

Unionist Attitude.

The Liberal press in England made light of these warnings, but the organization of opposition in Ulster went steadily on. As controlled by the Irish Unionist leaders it was formally independent of actual parliamentary tactics, and therefore of the action of the Unionist party under Mr. Bonar Law's guidance; but Unionist opposition in Parliament and in the constituencies was inevitably concerned with what might take place in Ulster. Mr. Bonar Law, at Blenheim on July 27 and in the House of Commons on Aug. 5, took his side openly with the Unionists of Ulster. If, he said, the Ulstermen were forced into defiance of a measure passed under the Parliament Act without further appeal to the electorate, and by the dictation of a Nationalist vote which had in their view always been disloyal to the Empire, any attempt to coerce Ulster could only mean civil war, and this could not be confined to Ireland; it was incredible that the Government should contemplate the coercion of Ulster by British bayonets, but if they went to that length the situation would be intolerable,—ministers would be "lynched in London." Many Liberals hoped to find relief by proposing to leave Ulster out of the Home Rule bill, at least temporarily, altogether; but an independent Liberal amendment to this effect in Committee (July 18), after some ambiguous inquiries from the Government whether Ulster would be satisfied if it were adopted, was rejected by 320 to 252.

Progress of the Bill.

Meanwhile, on April 23 an Irish National Convention in Dublin, with Mr. Redmond presiding, accepted the bill, and the doubts as to whether Irish Nationalists might disagree over it and it might be snuffed out like the Irish Councils bill in 1907, were dissipated. On July 19 Mr. Asquith addressed an enthusiastic meeting in Dublin, and was received with fervour as the first English Prime Minister who had had a welcome there in Nationalist circles. The first reading of the bill was carried in the House of Commons on April 16 by 360 votes to 266, and the second reading (April 30) on May 4 by 372 to 271. The Committee stage began on June 11, and on July 3 the first clause had gone through; discussion was then suspended till the autumn. On the Unionist side the objections to any scheme for a separate Irish Parliament and executive were fortified by criticisms of special features in the new bill itself—the finance, the proposal for Irish representatives to remain at Westminster, the separation of post-offices and custom-houses—but these subjects had still to be further discussed when Parliament adjourned in August. On the Liberal side a good many members disliked the provision for the nomination of an Irish Senate, and this question arose in Committee on Clause 1, but an amendment to exclude it was rejected (June 19) by 288 to 199.

The Solemn Covenant.

Effective opposition was in Ulster, not in Parliament. Serious rioting between Protestants and Catholics in the Belfast shipyards during July showed the tension there; and on Sept. 14 a free fight between partisans of both sides, in the course of a football match at Belfast at which 10,000 people were present, resulted in injuries to about 100, revolvers and knives being used. Active preparations were on foot for a series of Unionist demonstrations in Ulster, leading up to the signing on Sept. 28 of a Solemn Covenant, pledging resistance to Home Rule. The perplexity on the Liberal side in face of Ulster's determination was shown by a speech of Mr. Churchill's at Dundee on Sept. 12, in which he suggested, purely on his own account, that, to secure a federal system of government for the United Kingdom, to which Home Rule for Ireland, however, was an essential preliminary,—it might be desirable to grant separate legislatures to large homogeneous areas in England like Lancs., Yorks., the Midlands, and London; he would not shrink from the creation of 10 or 12 such English bodies, all subordinate to the Imperial Parliament. Mr. Churchill's speculation was effectively criticized by Mr. Balfour at Haddington on Oct. 9, the scheme being described as "the application of decimal fractions to the United Kingdom." What Unionist Ulster demanded was to remain under the Imperial Parliament and not be at the mercy of a parliament in Dublin.

The text of the Solemn Covenant, promulgated by the Ulster Unionist Council, was as follows:—

> Being convinced in our consciences that Home Rule would be disastrous to the material well-being of Ulster as well as of the whole of Ireland, subversive of our civil and religious freedom, destructive of our citizenship, and perilous to the unity of the Empire, we, whose names are underwritten, men of Ulster, loyal subjects of His Gracious Majesty King George V., humbly relying on the God Whom our fathers in days of stress and trial confidently trusted, hereby pledge ourselves in Solemn Covenant throughout this our time of threatened calamity to stand by one another in defending, for ourselves and our children, our cherished position of equal citizenship in the United Kingdom, and in using all means which may be found necessary to

[1] The anniversary of "Craigavon Day," Sept. 23 1911, when Sir E. Carson was acclaimed the Ulster leader, and the Declaration of Ulster was published to the above effect, was celebrated in 1912.

defeat the present conspiracy to set up a Home Rule Parliament in Ireland; and, in the event of such a Parliament being forced upon us, we further solemnly and mutually pledge ourselves to refuse to recognize its authority. In sure confidence that God will defend the right, we hereto subscribe our names, and, further, we individually declare that we have not already signed this Covenant.

Sir Edward Carson signed first, on Sept. 28, at the head of a great gathering in Belfast. And when, just afterwards, he crossed with Mr. F. E. Smith to Liverpool, he had a remarkable ovation, violent speeches being made by sympathizers with the cause of Ulster,[1] in favour of supporting her resistance by force of arms. It was announced later that the total signatures to the Covenant were:—*Ulster*, men 218,206, women 228,991; *Outside Ulster*, men 19,162, women 5,055.

Reference must now be interposed to the progress of the industrial unrest in England, culminating during 1912 in the general strikes of coal-miners and transport workers. For some time past trouble had been brewing in the coal industry. In Dec. 1910 a strike had begun at the Cambrian Combine Collieries (of which Mr. D. A. Thomas, afterwards Lord Rhondda, was managing director), owing to the failure of the two referees (representing owners and men) appointed by the South Wales Conciliation Board to agree upon a tonnage price for the working of a seam at the Ely Pit, which had till then been worked on day-work. The rates offered by the owners were denounced by the strike committee as a "starvation" wage; but the strike was really a forward move on the part of the younger extremists among the men, who had obtained the upper hand and were influenced by socialistic doctrines. A general lockout of the men working in other seams in the Ely Pit was the masters' reply. The Welsh Socialists then sent delegates to enlist sympathy among the English and Scottish miners elsewhere, and to try to bring about a general strike; but the leaders of the Miners' Federation of Great Britain were not prepared to support the action of the Ely Pit strike committee, and financial support was withdrawn, so that the strike collapsed.

National Coal Strike, 1912.

The Miners' Federation next put a claim before the owners in the federated area for the fixing of definite rates of payment in the case of "abnormal places" where the men were unable to earn an average day's wage for no fault of their own. At the Southport conference of miners' delegates in Oct. 1911 the following resolution, proposed by the executive, was unanimously passed:—

That the federation take immediate steps to secure an individual minimum wage for all men and boys working in mines in the area of the federation, without any reference to the working places being abnormal. In the event of the employers refusing to agree to this, the 21st rule to be put into operation to demand assent.

At a second conference on Nov. 14, at which the refusal of the employees to accept the minimum wage was reported, an adjournment was resolved on (by 336,000 votes to 238,000) for future negotiations; and on Dec. 21, the situation remaining the same, it was resolved that a ballot should be taken on Jan. 10-12 1912 on the question: "Are you in favour of giving notice to establish the principle of a minimum wage for every man and boy working in the mines of Great Britain?" A resolution was also passed "that each district send to Mr. Ashton (general secretary of the Miners' Federation) a tabulated statement of what it desires to be its minimum wage, and that the executive committee of the Federation meet to consider the statements and report to a national conference in Birmingham on Jan. 18 1912." The result of the ballot showed 445,801 votes for giving notice, 115,721 against,—majority 330,080, South Wales alone giving a majority of 85,107 for stopping work. And on Feb. 2 1912 a definite schedule of the minimum rates asked for was approved.

The coal-owners met on Feb. 7, and the Welsh owners then refused to discuss any minimum wage and retired from the conference. This made a strike inevitable, since the miners were not prepared to settle with any but the whole federated area. Notices were given accordingly, the public being faced with a prospect of a complete cessation of coal supplies. The Prime Minister on Feb. 20 invited both sides to meet him to discuss means of averting a national stoppage, and their representatives met him on Feb. 22, but to no purpose; and on Feb. 26 the first miners went on strike at Alfreton, the rest soon following, in spite of the announcement that the principle of a minimum wage was now adopted by the Government and that they would take steps to give it parliamentary sanction unless an agreement were arrived at. On this point a split occurred between the coal-owners, those of Durham and the federated districts being prepared to fall in with the proposal of the Government, and the others refusing. On March 1 over a million coal-miners were out (Yorks. and N. Midlands 235,000; S. Wales 220,000; Scotland 130,000; Northumberland 120,000; Durham 110,000; Midlands and South 105,000; N. Wales 70,000; N. and E. Lancs. 45,000), and during the whole month the country was convulsed by the calamity.

At last, after the Government had made a further unsuccessful attempt, by a conference, to bring owners and miners to agreement, on March 10 1912 Mr. Asquith introduced in the House of Commons a Minimum Wage bill as their last resort. It provided that, in the coal industry, every contract for employment should involve the payment of a minimum rate, to be settled for each district by a joint board set up under the auspices of the Board of Trade. The bill was read a second time on March 21, after a motion for its rejection by Mr. Balfour, on behalf of the Opposition, had been defeated by 348 votes to 225, and it had passed both Houses on March 28. Having made their protest against a piece of revolutionary legislation which introduced so novel and far-reaching a principle into industrial economics, the Unionists left the responsibility to the Government, and the only parliamentary difficulty was caused by the Labour party, who fought for the inclusion of a precise definition of the minimum in the shape of 5s. a day for adults and 2s. for boys; as the Government refused this and insisted on the rates being fixed by the district boards, the Labour party opposed the third reading, which, however, was carried by 213 to 48. There was acute dissatisfaction among the miners at the failure of the Labour party to get their own minimum schedule of rates adopted, and for a time the result was doubtful; but it was decided to take a ballot (April 1) on the question of returning to work, and though a majority still voted for staying out (244,011 to 201,013) it was not large enough (two-thirds being required by the rules).

Minimum Wage Bill.

The fact was, the funds were exhausted and the men had had enough of the struggle. The conclusion of Sir A. Markham, the Liberal M.P. and coal-owner, writing in the *Quarterly Review* for April 1912, is probably the verdict of history, he considered that "the ground of attack was ill-chosen; the men should have stood to their original demand, the payment on account of abnormal places or losses due to bad management. If in addition they had asked for an increase of wages equivalent to 10% on the basis rates, to meet the increased cost of living, they would have occupied strong ground. The great mass of men came out to obtain higher wages, and for no other reason; and when they voted for the formula 'minimum wage' nine-tenths did not know what they were voting for." The result, as the year went on and the minimum rates were settled, not without friction, was a profound disgust among the coal-miners generally with the operation of the new Act, which was found to do very little to increase the amount paid in wages; but it had done its work for the moment, the crisis being over. In Oct., moreover, an agreement was arrived at between repre-

[1] It must be remembered, of course, that "Ulster," as an Irish political unit, did not mean the whole province, but only the N.E. portion, comprising the five counties of Antrim, Armagh, Down, Londonderry and Tyrone, with the cities of Belfast and Londonderry. As a geographical unit Ulster had a pop. (1911) of 1,581,696, but the N.E. portion by itself had 1,188,695. Out of the latter total, those of 16 years old and over were 387,241 males and 438,774 females. As the census classification showed that 33·1% of the pop. in this N.E. area was Roman Catholic, the number of adult male Protestants in Ulster who might be expected to sign the Covenant was not much in excess of those who actually did so.

sentatives of miners and coal-owners of the English federated area, by which about 400,000 workers would at once receive an advance of a shilling a week in wages. This was the outcome of discussions before a Conciliation Board, which had been in existence for some years and was now renewed for a further period; and this addition of about £1,000,000 a year was worth more than all the haggling about minimum rates.

In connexion with the opening phases of the railway strike of 1911, allusion has already been made to the sporadic strikes of other sections of "transport workers" earlier in the year; and the general dock strike, which began in London on May 20 1912, was really the concluding phase of the unrest which had been only partially quieted during the previous August. First the lightermen came out, and then a "sympathetic" strike involved all the other unions of transport workers connected with the Port of London. The nominal reason for the lightermen ceasing work was their objection to one man employed as a watchman having no "federation ticket"; he belonged to the Foremen's Society, a union not affiliated to the Transport Workers' Federation, but refused to join the Lightermen's Society, which was so affiliated, and when the lightermen demanded his dismissal, on the ground that they would work only with men who belonged to the federation, his employers naturally refused. This was, however, in reality only the culmination of a number of "grievances" put forward by the men, who complained of being victimized under the terms of the existing agreements. Unsuccessful negotiations had for some time been going on between their secretary, Mr. Gosling (himself actually a member of the Port of London Authority), and the Board of Trade, with a view to pressure being put on the employers; and the declaration of a strike on May 20 for the reason given was prompted by the hope that the hands of the Government would be forced. In taking this step the lightermen relied on their privileged position in the Port of London. Their Society held an old licence from the Watermen's Company, whose functions were transferred in 1908 to the new Port of London Authority, and the law was that unlicensed men should not be employed so long as licensed men were available, so that, apart from the difficulty of obtaining substitutes in an emergency, the employers, as they knew, would have to reinstate them when the strike was over. (One result of the strike was that the Port of London Authority took steps to get this law altered.)

Transport Workers' Strike, 1912.

The Federation of Transport Workers now took up the lightermen's cause, and in doing so put forward a further grievance on behalf of the Carters' Union, by whom an agreement had been made with the Master Carters' Association when the strike of the previous August was settled. The complaint was that one firm which had joined the association had dismissed their union men, contrary to the terms accepted, and had resigned from the association when it called them to account, so that the agreement was useless. The union demanded accordingly that all employers in the Port should be obliged to belong to a masters' federation, which would have power to guarantee the carrying-out of agreements. As no concession on this point was forthcoming, notice of a general strike of all members of the Transport Workers' Federation was given.

The Government at once took action by appointing Sir Edward Clarke, K.C., to hold an inquiry on May 24. He made his report on May 28 to the effect that, while the lightermen were wrong in supposing that the award of the previous Aug. meant that none but members of their federation should be employed, and they themselves had broken their agreement by striking without recourse to arbitration, still there were several points on which the transport workers had legitimate grievances, owing to the employers not having carried out certain terms of their agreements also. The Government on May 29 suggested a conference between the two sides, which was, however, declined by the ship-owners, who insisted that the only point really at issue was the lightermen's breach of agreement in suspending work and thus dislocating the whole business of the Port. Meanwhile a general strike of transport workers was in progress at the docks, some 80,000 men being affected, and the whole food supply of London was threatened; but the shipowners actively engaged "free" labourers in spite of trade-union picketing and intimidation, and day by day managed more efficiently to get their ships unloaded. Public discussion, influenced by Sir Edward Clarke's report, and its criticism of both sides, centred round the apparent necessity of providing, alike for masters and men, some guarantee against breaches of agreements; and Mr. Lloyd George, who in Mr. Asquith's temporary absence in the Mediterranean dominated the Government policy, made proposals, which he explained in the House of Commons on June 5, for a Joint Conciliation Board, combined with pecuniary guarantees on both sides. Mr. Gosling, on behalf of the transport workers, gave a general assent to this suggestion, but the employers and the Port of London Authority (with Lord Devonport—formerly Mr. Hudson Kearley, a well-known Liberal M.P.—as chairman), after careful consideration, rejected it on June 10. It was pointed out by them that there was no proper basis, under the conditions prevailing at the docks, for such a board, the trades concerned being very different and the employers (some of whom were foreign firms) themselves being competitors; the Port of London Authority moreover was a statutory body, with distinct obligations and responsibilities, and could not well enter into such an arrangement, any more than a Government department could —the Post Office, for instance—with the men in its employment. This was not a case of a strike against some individual firm which had given legitimate cause of offence, but a general strike against the whole Port, defying all agreements.

Attempts at Settlement.

Negotiations now broke down altogether, and the leaders of the Transport Workers' Federation declared a "national" strike and tried to call out all its allied members at other ports as well as London. But though some 30,000 men responded altogether at Manchester, Southampton, Bristol, Plymouth and Swansea, this appeal for a "national" strike was a thorough failure; the railway unions had had enough fighting the year before and the seamen and firemen, as a body, were not prepared to come out. Scenes of violence were of daily occurrence between unionists and free labourers at the London docks; but by June 18 it was clear that the Port of London Authority and the employers, aided by police protection (which Mr. McKenna, the Home Secretary, provided, though somewhat grudgingly), had the strikers well beaten, having obtained a sufficient supply of labour for the handling of cargo. From this point, the strike degenerated into sheer anarchism. Serious conflicts occurred, in which revolvers were used in self-defence by the free labourers, notably on July 24 and on July 31, but by degrees the strike committee realized that their efforts were in vain. They recommended a return to work on July 27, but a mass-meeting in Hyde Park next day refused to comply with this advice, and it was not till a week later that all pretence of continuing the strike was abandoned. On July 31 the lightermen decided to give in, and the riot among the dockers that day was mainly due to their finding that their old places had been filled up and that it no longer rested with them to say whether they were wanted any more or not. On behalf of the employers, however, and of Lord Devonport, a general assurance had been given that, if the strike were abandoned unconditionally, any outstanding grievances under the old agreements would be inquired into and reinstatement effected as soon as possible for men who had formerly been in regular employment; and, as the strike committee and the leaders could hold out no longer, further resistance came to an end.

The real object of the strike, in so far as it aimed at being a "national" one, was to compel Parliament to legislate, as it had done for the coal-miners. In this case, however, the Labour politicians and their sympathizers were impotent. The discussions in the House of Commons turned mainly on Unionist criticism of the Home Secretary for the apparent disinclination he showed for using

"Neutrality" in Parliament.

force to preserve order and protect the free labourers. On June 12 Mr. Austen Chamberlain moved a vote of censure on Mr. McKenna, which was rejected, however, by 337 to 260. On July 1 Mr. O'Grady (Labour M.P. for E. Leeds) moved a resolution "that it was expedient that the representatives of the employers and working men's organizations involved in the dispute should meet with a view of arriving at a settlement," and Mr. Asquith left the matter to the House, saying that he himself would not vote on it, as he did not think Government intervention would be justifiable or expedient. Mr. Bonar Law, for the Unionists, having expressed his surprise that in those circumstances Mr. Asquith did not oppose the resolution, moved as an amendment, "that this House regrets the continuance of the strike and the consequent suffering, and approves of the declaration of the Prime Minister that the constitutional and normal attitude of the Government should be one of complete detachment and neutrality, and is of opinion that the intervention of this House in this instance can serve no useful purpose." The amendment was rejected by 260 to 215, and the resolution was carried by 254 to 188. This was the end, however, of any parliamentary action. The strike was already collapsing, and its only political result was to focus public opinion on the desirability of compulsory arbitration, or at any rate some improved machinery for making agreements, once entered into, binding on both sides.

The Autumn Session, 1912.

Parliament met again for the autumn session of 1912 on Oct. 7, and the political conflict was once more renewed in the House of Commons. The effect of the Ulster demonstrations on the Government, up to this point, had not been specially terrifying; and Mr. Asquith, speaking at Ladybank on Oct. 5, dealt somewhat scornfully with Sir Edward Carson's movement and the Unionist attitude towards it. The Government, he intimated, were ready to consider any proposals for safeguarding Ulster, but Ulster had nothing to suggest—she simply would not allow Ireland to have what the other four fifths of Ireland demanded. It was impossible for the Government to give way to intimidation, prompted by the spirit of Orange ascendancy; they meant to go on with their bill. On Oct. 10 he introduced in the House of Commons a series of resolutions for completing the various stages of discussion on it by Christmas under the closure. Including the time already occupied, 50 days (to which two were added a few days later) were, on this scheme, to be devoted to debate. An Opposition amendment, proposed by Mr. Bonar Law, was defeated by 323 to 232. The operation of the guillotine, combined with the "Kangaroo" system by which the chairman of committees was left to choose which among the various amendments proposed should be discussed in the time available, made the resumption of the committee stage simply a question of whether the Government could maintain their majorities; any effective debate was obviously impossible, and Mr. Bonar Law bluntly declared that the Government might just as well have moved that the bill should be passed without further delay. On the other hand it was equally true that, without such a time-limit, the Opposition would have protracted the debates indefinitely; the Government had no option in the matter if they were to send the bill up to the House of Lords during that session, as they must, in order to obtain the benefit of the terms of the Parliament Act. Even if the Home Rule bill were to be passed through the House of Commons by Jan., the Government programme was overloaded, for they had announced their intention also to pass the Welsh Disestablishment bill, the Franchise bill and other measures, before the session ended.

The Land Agitation.

At the same time, with Mr. Lloyd George's active encouragement, yet another political issue was being made prominent throughout the constituencies, in the shape of an organized agitation for land-tenure reform and increased taxation of land-owners, promoted more particularly by a section of the Radical party who had long been advocates of the single-tax theory on Henry George's lines. The Budget of 1909 (as incorporated and passed in the Finance Act of 1910), with its provisions for effecting a complete valuation of the land, paved the way for such a movement, and the land-reformers saw their opportunity now for pushing their views and preparing for legislation. The fact, indeed, that the yield of the new land-value duties in 1911 and 1912 proved disappointingly meagre had even driven them to seek this extension of policy. For, with the comparatively humdrum budgets of those years, the critics of "Lloyd George finance" in that respect were already taunting it with utter failure. The unpopularity of the Insurance Act made it opportune, moreover, for Mr. Lloyd George's section of the party to try to divert electioneering attention on the Radical side to something more attractive, and at the summer and autumn by-elections the new land campaign was made a leading feature by Radical candidates. Intense exasperation was created on the Conservative side, representing as it did to so large an extent the landed interests of the country, by the organization of an unofficial committee of inquiry under Mr. Lloyd George's auspices, with the authority of the Cabinet, in order to obtain evidence of various sorts of agrarian grievances in furtherance of a new Radical policy.

The Proposed Irish Senate.

An important change in the Home Rule bill was made when on Oct. 30 the discussion in committee reached clause 8, concerning the composition of the Irish Senate. It was suddenly announced by Mr. Asquith that, while the proposed nomination of the first senators by the Imperial Government would be adhered to, the Government had decided to abandon the idea of their successors being nominated by the Irish Government. Instead of this, the method would be substituted of election by the voters in the four Irish provinces, taken as units, on a plan of proportional representation, each elector having a "transferable" vote (*see* 23.115). The term of office for senators would be five years, and all would retire together at the end of the fifth year so that the elections might then be taken. The next day (Oct. 31) the revised clause was introduced and carried. Mr. Asquith insisted that it would be an additional safeguard for the Unionist and Protestant minority in Ireland, but Mr Bonar Law regarded it as worthless for any such purpose, and Mr. Healy frankly declared that in his opinion the Irish Unionists would have been better off with the method of nomination. Mr. Redmond, while accepting the Government's decision, expressed much the same view. The fact was that the whole idea of a nominated Senate was distasteful to most of the Liberal party, and it seemed a favourable opportunity for putting the experiment of proportional representation, which had recently made many converts, into practice.

Government Defeat and its Result.

On Nov. 8 Mr. Asquith introduced a "guillotine" time-table for the Welsh Church bill, allocating 14 days to the committee stage, two to report, and one to third reading. So short a shift excited much bitterness on the Opposition benches, the discussion that day being adjourned; and on Nov. 11 the situation in the House of Commons was changed by an unforeseen event. On a resolution required as a preliminary to discussion of the financial clauses of the Home Rule bill Sir F. Banbury moved an amendment without notice, providing that the total payment from the Imperial to the Irish exchequer in any one year should not exceed £2,500,000. It was early in the afternoon, when the Unionists were in unaccustomed force, and the Government was defeated by 228 to 206. Mr. Asquith immediately moved the adjournment of the House; and next day it was announced that the Cabinet had decided to move a resolution rescinding the vote and providing (so as to regularize further proceedings under the time-table, which was entirely upset by the incident) that the next day on which business was taken on the Home Rule bill should count as the "16th allotted day," though, as previously fixed, the 16th day was Nov. 11; when this had been done, they proposed to reintroduce their financial resolution and proceed as though nothing had happened. On the 13th Mr. Asquith accordingly moved to this effect. This proposal to rescind the vote and set up the resolution afresh was, however, as the Speaker agreed in reply to Unionist objections, absolutely unprecedented in parliamentary procedure.

It had always been held, and was laid down by Erskine May, that no question or bill could be brought up in the House that was substantially the same as one on which judgment had already been expressed in the current session; and when the Speaker nevertheless ruled that Mr. Asquith's motion, though unprecedented, was in order, Opposition exasperation became intensified to a point beyond control. After Mr. Bonar Law had argued the case at length, and had moved the adjournment of the debate, which Mr. Asquith curtly declined to accept, a state of organized disorder prevented any further proceedings. The Speaker at last took the only course open to him, and adjourned the House. There seemed likely to be renewal of the same scene next day, but calmer counsels prevailed. At the opening of the sitting the Speaker suggested that, if more time were given for reflection, a less objectionable way might be found for regularizing the proceedings. Mr. Asquith promptly accepted this suggestion, and moved that the House should adjourn for the purpose till Monday the 18th. As Mr. Bonar Law concurred, this course was adopted, and the anticipated storm was avoided. The air had previously been cleared to some extent by amends being made by Mr. Ronald McNeill for the most violent incident in the disorder of the previous evening. In the heat of the moment he had thrown a book at Mr. Winston Churchill which struck him a severe blow on the face; but he now offered a handsome apology.

The Liberal press was inclined to treat the opposition to Mr. Asquith's motion as purely factious, and the organized disorder as a further mark of deterioration in parliamentary manners. But the historian cannot well take this simple view. The defeat of the Government was certainly an accident, but it was the sort of accident that happens when a number of nominal supporters are not personally enthusiastic for the particular cause involved, or are being tired out by excessive demands on their attendance. The opinion of a high independent Liberal authority on procedure, Mr. James Caldwell, ex-M.P. and formerly chairman of committees, was moreover that Mr. Asquith's proposal for meeting the new situation was "clearly out of order" (*The Times*, Nov. 16), although not so ruled by the Speaker. Owing to the critical state of foreign affairs, consequent on the situation in the Balkan War, a change of government, as Mr. Bonar Law frankly admitted, was not at this moment desirable; and if the Government chose to ignore what was formally a parliamentary defeat their normal majority was still available. But the Opposition were naturally not prepared to forgo what, according to the practice and precedent of Parliament, was a legitimate opportunity for impeding the execution of the Government's programme of legislation for the session; and they gained their point. On Nov. 18 Mr. Asquith made an amended proposal, which was agreed to without further discussion, that the financial resolution should simply be negatived that day and the committee stage on the financial clauses of the Home Rule bill set up afresh on the 19th by the introduction of an amended resolution, the report stage of which would be taken on the 20th, so that the next "allotted day" (the 17th day under the time-table) would be on Thursday Nov. 21. This course was accordingly pursued.

Home Rule Bill Guillotine.

After the scare in the Government ranks caused by the misadventure of Nov. 11 and its immediate consequences, the resumption of proceedings on the financial clauses of the Home Rule bill saw their normal majority well kept up, and the guillotine fell with merciless regularity. Faced with a hostile and unreformed House of Lords, whose certain antagonism could only be defeated by sending the bill up in time to obtain the benefit of the Parliament Act, the Coalition were compelled to restrict discussion in the House of Commons; and it might well be thought on their side that at this stage, since in any case the Parliament Act involved nearly two years' delay, it was futile to attempt to examine every detail in a scheme which was approved in principle, but which still had a long fight before it. On the other hand it was incontestable that, for a measure of such profound importance, supposing it to be one that might come into operation as it left the House of Commons [illegible] sion of the various difficult and obscure aspects of the new financial relations proposed between Ireland and Great Britain was entirely inadequate. Clause after clause was carried, undiscussed, under the closure, full of complicated provisions, the working of which very few of the rank and file in Parliament even pretended to understand. For judicial examination in debate, reflecting the careful conclusions of the House of Commons, was substituted the opinion of the ministers in charge of the bill, alike as to the powers it gave and the way those powers were likely to be used. Just as the Insurance Act had left all sorts of obscure questions to be settled by the commissioners, so the Home Rule bill left some of the thorniest problems of the financial relations with Ireland to be solved by the proposed Joint Exchequer Board, an entirely new official body, whose real status was highly questionable; and clause 22 providing for this, with the remaining financial clauses, 23, 24 and 25, were duly guillotined on Nov. 27. Eventually, under the guillotine, the bill passed its third reading on Jan. 17 1913. The committee stage had ended on Dec. 12, clauses 26–48 and the final schedules having been carried since Dec. 2 by the operation of the guillotine without any concession to Unionist criticisms. The committee stage had lasted altogether 36 days, including the 25 provided under the time-table; two clauses (1 and 37) had been fully discussed, and 22 partly discussed, while 24 had received no discussion at all.

Welsh Bill Guillotine.

For the Welsh Church bill the time-table resolution had similarly been carried on Nov. 28, at the end of an all-night sitting, though the Government agreed to give 16 days, instead of the 14 originally proposed, to the committee stage, which began on Dec. 5; and by Christmas 1912 this bill too was well on its way through the House of Commons. The discussions were marked throughout by much bitterness of feeling on the part of the defenders of the Church, among whom Lord Robert Cecil was specially prominent, but they were notable also for some important expressions of the desire of Liberal churchmen to make the disendowment proposals less harsh than what the Welsh Nonconformists considered to be in accordance with their rightful demands. A concession was made on clause 8, the Government accepting (Dec. 18) amendments proposed by Sir Ryland Adkins and Mr. Atherley Jones (both Liberals), by which, much to the disgust of the Welsh members, the Church would retain possession of the Queen Anne's Bounty funds and property. On another amendment, proposed by Mr. Ormsby Gore (Conservative), for keeping all the glebe as church property, the Government majority fell (Dec. 19) to 55, the figures being 277 to 222; and clause 8 was only carried by 284 to 221. The fact that the majorities in both these cases were smaller than the number of Irish Nationalists voting with the Government showed that there was a good deal of sympathy with the opposition among some sections of Liberals.

Revival of Liberal Confidence.

The actual proceedings in the House of Commons were being followed, however, with marked apathy in the country. Everybody felt that the real struggle had to come during 1913. During the past month the critical state of European affairs monopolized public interest; and the party conflict took a secondary place when larger issues were at stake. Mr. Asquith and Sir Edward Grey, by common consent, were making British influence a powerful factor for peace in the settlement of the Balkan crisis. The administration was strengthened for the moment simply by the fact that it represented the whole nation in the councils of Europe. Meanwhile trade was booming, and in some other respects also the position of the Government was more favourable than it had seemed likely to be a few months earlier. At Bolton, when there was a by-election on Nov. 23, the Liberal candidate surprised his own party by retaining the seat with only a slightly diminished majority. Moreover, the Unionists were again in the throes of further discussions over their Tariff Reform policy. Since Mr. Bonar Law had become the Unionist leader little had been heard of any waver-

ing as to the principle of low taxes on foreign wheat and other foodstuffs so as to give a preference to colonial imports. But the question of going to another election at all on a programme including food-taxes was now raised again on what started purely as a side issue. It was thought by the leaders of the party that the time had come when an explicit declaration should be made that Mr. Balfour's proposal, before the general election of Dec. 1910, to submit the first Tariff Reform Budget after the Unionists returned to office to a referendum, was no longer the party policy; and Lord Lansdowne accordingly made a statement to that effect at the Albert Hall on Nov. 14 1912. No sooner had it been made than an agitation arose in certain Unionist quarters, especially in Lancs., where it was contended that harm would be done to their electoral prospects by dropping the proposal; and the cry was taken up in circles where the food-taxes had always been disliked, with the result that pressure was put on Mr. Bonar Law to make a definite pronouncement on the whole scheme of Imperial Preference. This he did at Ashton-under-Lyne on Dec. 16, but without the effect that was presumably intended.

Mr. Law's Ashton Speech.

A large part of Mr. Bonar Law's speech was devoted to combating the claims of the Radical party that they were the peculiar friends of the working classes; on the contrary he insisted that the party now in power were occupied mainly in work of destruction, and that the real social needs of the community could only be met by a Unionist government. He repudiated the allegation that Tariff Reform was simply old-fashioned Protectionism. It was not proposed to bolster up industries which were not naturally suited to the country, or to enable manufacturers to secure an artificial monopoly. Tariff Reform involved the imposition of duties smaller than in any other country, and its object was to give British workmen a preference in the home market over their foreign competitors. Similarly, the object of Imperial Preference was to unite the Empire on lines of trade, and to secure for the United Kingdom the largest possible advantage in the British oversea markets. It was in connexion simply with colonial preference that food duties were included in the Unionist programme, and he adhered to that policy in spite of all the misrepresentations to which it lent itself. But here he announced a new departure:—

"If our countrymen entrust us with power, we do not intend to impose food duties. What we intend to do is to call a conference of the colonies to consider the whole question of preferential trade, and the question whether or not food duties will be imposed will not arise until those negotiations are completed. . . . Unless the colonies regard them as essential for preference the food duties will not be imposed. All that we ask is that our countrymen should give us authority to enter into that negotiation. If the colonies do think them necessary, then I for one do not believe that the people of this country would not be ready to make that readjustment which is necessary to effect the purpose."

As regards the referendum, Mr. Law repeated Lord Lansdowne's declaration, and justified it on the ground that a pledge to submit the result of the negotiations with the colonies to a referendum would not be fair to the colonies.

Unionist Internal Dissensions.

Next morning this speech had a "mixed" reception both in the Unionist press and in the party. In some quarters strong objection was taken to making the taxation of the United Kingdom appear in any shape to depend on the decision of the colonies; the responsibility must be with the electors of the United Kingdom. In Lancs. and Yorks., and also in Ireland and Scotland, some important Unionist papers openly mutinied against the abandonment of the referendum. Uncertainty as to what Mr. Law really meant—an unusual thing in his case—led to a revival, in the clubs and in the House of Commons, as well as in the press, of the same sort of expression of hostile sectional views that had made Mr. Balfour's leadership so difficult between 1903 and 1906. There were "alarums and excursions" for several days. As consideration became cooler, it was recognized, however, that nobody wanted to do anything that was not in the interest of a united party. Mr. F. E. Smith, speaking at Dudley on Dec. 20, declared that the whole Unionist front bench in the House of Commons adopted the views expressed by Mr. Law, and that he had never meant that the decision as to food duties would be left to the colonies; all that be meant was that the decision must depend on what the colonies wanted. Mr. Austen Chamberlain also wrote a letter to a correspondent on Dec. 23, agreeing with Mr. Bonar Law.[1]

The Doctors and the Insurance Act.

While this lively interlude was providing sport for the Free Trade party, the penultimate act of another drama, of more direct import to Liberalism, was also drawing to its close. On Dec. 10 the result of the poll was published which had been taken among the medical profession, as to whether they would accept Mr. Lloyd George's latest terms for ordinary medical service under the Insurance Act. Out of a total vote of 13,731, 11,309 were for rejection. On Dec. 20 the representative meeting of the British Medical Association was held, and by 182 votes to 21 a resolution was passed rejecting the Government proposal and advising the profession to decline service under the Act. In the previous Feb. practically the whole profession—at all events 27,400 doctors—had signed an undertaking to stand together by the policy to be decided upon by the British Medical Association, and if they held to their pledge this meant a complete breakdown in the provisions of the National Insurance Act for medical benefit, which were to become operative on Jan. 15 1913. On the other hand, a scheme for an alternative policy was coupled with this flat refusal of Mr. Lloyd George's own proposals. It was recommended that the profession should express its willingness to treat insured persons, under arrangements to be made between local committees of doctors and the insured or their representatives (*i.e.* the approved societies) for a minimum capitation rate of 8s. 6d., inclusive of drugs, or a minimum fee of 2s. 6d. a visit, on condition that each insured person should have free choice of doctor and that the doctor should consent to act. Under this plan the doctors would not be dictated to by the lay insurance committees, but the financial terms would be practically the same that Mr. Lloyd George had last offered. It was promptly announced that the Government could not fall in with this proposal, which would involve handing over public money without public control; and the question now was whether there would be sufficient breaking-away from the pledges given to the British Medical Association for the insurance committees to be able to secure their panels of doctors in accordance with the regulations under the Act. Only about half of the 27,000 doctors who had ranged themselves with the Association in Feb. had actually taken the trouble to go to the poll in Dec., and though this was generally believed not to indicate in itself any corresponding failure in the solidarity of the profession, there were now signs of a good deal of independent action in certain localities, and notably in Scotland. Already in Nov. a few doctors who thought it a public duty to fall in with the Government scheme had started a new organization in opposition to the British Medical Association, called the National Insurance Practitioners Association; and its influence, backed by Government support, was being exerted in the same direction. On Jan. 2 1912 Mr. Lloyd George, addressing the Advisory Committee, took a sanguine view of this situation, and declared that some 8,000 doctors were available. Nevertheless the strike now proclaimed against the Insurance Act by the recognized leaders of the medical profession was a very awkward fact for the Liberal party.

The year thus ended with the promise of a full crop of domestic political difficulties to be harvested in 1913. (H. CH.)

II. FROM JAN. 1913 TO JULY 1914

The political difficulties bequeathed by 1912 to 1913 were still unsolved 10 months later, at the outbreak of the World War in Aug. 1914. The medical opposition to the National Insur-

[1] Eventually, as the result of a memorial from the bulk of the Unionist M.P.'s, Mr. Bonar Law, on Jan. 14 1913, stated in a letter that he and Lord Lansdowne, while remaining leaders of the party, were willing to agree that food duties should not be imposed without the approval of the electorate at a subsequent general election.

ance Act did indeed melt rapidly away in 1913. In spite of a vehement professional meeting of protest on Jan. 7, the British Medical Association found itself forced by the independent action of doctors in all parts of the country to release its members from their pledge not to serve on the panels; and, though the Act remained for long unpopular, medical benefit was brought generally into operation, as arranged, on Jan. 15. At first the panel doctors were greatly overworked, and there were many hitches in administration. To obviate these, and to meet objections raised by the great Friendly Societies and by the trade unions, a substantial amending bill, involving a further charge on the State of £200,000 per annum, was introduced and carried by the Government. The Opposition did not fail to point out that this immediate necessity for amendment proved their charge that the provisions of the original Act were hasty and ill-considered; but Mr. Lloyd George was able to claim in Aug. that there were 18,000 doctors and 9,000 chemists working under the Act and prospering through it; that 270,000 workers were receiving sickness benefit, and that 20,000 consumptives—13,000 in sanatoria—had been already treated. In Feb. of the following year he boasted that there were over 20,000 general practitioners on the panels out of 22,500 in Great Britain; that nearly £4,500,000 had been distributed among them, besides £933,000 for drugs and an unallotted balance between doctors and chemists of £310,000.

The internal controversy among the Unionist party about Tariff Reform was also settled, at any rate temporarily, at the beginning of 1913. Mr. Bonar Law's Ashton declaration did not satisfy the opponents of food taxes, who were strongly supported by important organs of the Unionist press, and early in Jan. a memorial was presented to him signed by almost the whole body of Unionist M.P.'s, advocating a further modification of the proposed procedure but strongly deprecating any consequential change of leadership. The leaders acceded to their followers' wishes. After stating that the Unionist policy would be not to impose new duties on food, in order to secure the most effective system of preference, until they had been submitted to the people at a general election, Mr. Law added that he and Lord Lansdowne would have preferred that this change of method should be accompanied by a change of leaders, but in deference to the expression of opinion in the memorial they would remain. In a speech at Edinburgh on Jan. 24, Mr. Law claimed that, in spite of the modification, the flag of imperial preference was still flying, and the Unionist policy remained perfectly definite. They would impose a lower tariff than that of any industrial country on manufactured goods; they would give the Dominions the largest preference possible without food duties; and they would try to establish coöperation throughout the Empire in trade as well as in defence. They would work out with the Dominions the best scheme to this end, and put it before the electors for their assent. The solution was welcomed by the bulk of the Unionist party, and was accepted by Mr. Austen Chamberlain, though he said in Dec. that his submission to the conditions laid down at Edinburgh was the bitterest sacrifice he had ever made. There were protests in extreme Tariff Reform circles, but these did not seriously impair the regained unity of the party.

Unionists and Food Taxes.

But no solution was found, before the war broke out, of the franchise question, of the grave problems of industrial unrest, or of those involved in the two great measures going forward under the provisions of the Parliament Act—the Welsh Disestablishment bill and the Irish Home Rule bill. The Franchise bill which the Government had introduced was to serve two main purposes: to abolish plural voting, and to afford a means, by way of amendment, of testing the opinion of the House of Commons on women's suffrage. The abolition of plural voting was strongly resented in the City of London, the most famous constituency in the country, as thereby an electorate containing the principal bankers and merchants of the Empire would be transformed into one consisting of a small number of resident caretakers and messengers. But it was the proposal to enlarge the bill by including women's suffrage in it that proved fatal. On Jan. 27 the Speaker ruled, as a matter of order, that, if any amendments of the kind were inserted, the bill would become a new bill and would therefore have to be withdrawn. The Reform bills of 1832, 1867, and 1884 had been designed to enfranchise new classes of the people: this bill was not, and therefore could not properly be amended in the sense desired by the advocates of women's suffrage. The Government accordingly withdrew the measure, promising, however, to give facilities for a private member's suffrage bill in the next session. This *contretemps* was a blow both to the prestige of the Government and to the suffragist cause. Militancy was at once resumed and was rampant throughout the year; Mrs. Pankhurst, the leader of the movement, announced that she would hold nothing sacred except human life. Shop-windows were smashed; golf links were defaced; telegraph wires were cut; church services and public meetings were interrupted; a woman lost her life in attempting to interfere with the race for the Derby. But arson was the principal weapon of the extremists, and during the year many railway stations, grand stands, boat-houses, pavilions, unoccupied country-houses, and even churches were by them wholly or partially burnt down. Popular feeling, in consequence, ran high against the militants; their meetings in London were broken up and had to be prohibited by the police. A large proportion of the women who were convicted of committing outrages and sent to prison started a hunger-strike. This move was met by forcible feeding—a practice against which public opinion revolted, and for which was substituted, under an Act passed *ad hoc* and nicknamed the "Cat and Mouse" Act, a system of releasing prisoners on licence. The atmosphere produced by these events was not favourable to the Women's Suffrage bill, which was rejected on May 6 by 267 votes to 219, all parties being divided except the Labour members who solidly supported the bill. The "Cat and Mouse" Act proved a failure. The women released under it qualified for prison once more, directly their strength was restored, by committing fresh outrages, and the authorities, who could not let their prisoners die on their hands, resorted again to forcible feeding in spite of the protests of many clergy and humanitarians. Meanwhile the non-militants, who formed the great majority of the supporters of the women's suffrage movement, were not inactive. Under Mrs. Fawcett's leadership they constantly pressed ministers to introduce a Government bill; and they advertised their cause by promoting a pilgrimage of women who perambulated the length and breadth of England at the height of summer in eight separate contingents, uniting at the end in a great demonstration in Hyde Park on July 26. In spite of the efforts of both sections, the Government maintained its neutral position. But it introduced a simple Plural Voting bill in April, with a view to passing it ultimately into law under the Parliament Act. It was carried through Committee in the House of Commons, in spite of Opposition protests, by the "Kangaroo" closure, and was rejected, because it was unaccompanied by a measure of redistribution, on second reading by the House of Lords. There was a repetition of this process in the session of 1914; but, owing to the outbreak of war, the bill was not introduced in 1915, and so failed. A compromise was arranged on another measure, the Temperance (Scotland) bill, to which it had been intended to apply the Parliament Act. In the shape in which the House of Lords passed the bill, it provided for local option on the question of liquor licenses in certain areas in Scotland; the popular vote, however, was postponed until 1920—when, it may be added, the Prohibitionists met with a severe defeat.

Franchise Bill and Women's Suffrage.

Militancy.

Plural Voting Bill.

Militancy was continued and intensified in the first half of 1914. Outrage so frequently took the form of wanton damage to valuable pictures in the National Gallery, Royal Academy, and other exhibitions that public galleries had to be closed. Arson was rampant. Bombs were exploded in well-known churches, the coronation chair in Westminster Abbey having a narrow escape from serious injury by this method. An unsuccessful attempt

Renewed Militancy in 1914.

was made to force a way into Buckingham Palace to petition the King in person; and His Majesty was subjected, on several public occasions, to rude interruption. The number of militants actually committing crimes was small, but they had a large number of enthusiastic sympathizers who kept them well supplied with funds. Formal protests and condemnation by the non-militant section of suffragists had no effect on the campaign, which was only terminated by the coming of war.

Although the labour conflicts of 1913 and the first seven months of 1914 were not on the scale of the great strikes of 1912, there was constant unrest, and many signs that serious trouble was brewing. The Labour party in Parliament marked their increasing divergence from the principles accepted by both the historical parties by moving, at the beginning of the session of 1913, an amendment to the Address, which was of course easily defeated, in favour of a general system of nationalization. While there were sporadic strikes in various parts of Great Britain in the autumn and winter of that year, the principal disturbance was in Dublin and the neighbourhood, where, under the leadership of James Larkin, of the Irish Transport-Workers' Union, a series of strikes was organized, which lasted, despite official and other efforts at settlement, from Aug. to the close of the year, and which, during part of that time, brought the trade of the port of Dublin to a standstill. Larkin conducted his campaign with violence, was more than once arrested, was convicted of using seditious language, imprisoned, and then after a fortnight released. At first there was much sympathy from the Trades Union Congress and other representatives of English labour; the Dublin strikers were supplied with funds from England, and there were some half-hearted attempts at sympathetic strikes. But Larkin's revolutionary attitude, which had already antagonized moderate Irish Nationalists, eventually alienated British labour leaders, and left him only the support of the extremists, who held the first Syndicalist congress in Great Britain that autumn and declared in favour of "direct action." Early in 1914 there was great indignation in British labour circles over the deportation by the South African Government of the labour leaders concerned in strike disturbances in Johannesburg. They were received, on their arrival in England, with great demonstrations at the London Opera House and in Hyde Park; and an unsuccessful attempt was made by the Labour party in Parliament to interfere with the discretion of a self-governing dominion. The irritation caused by this deportation was symptomatic of the general labour unrest, which in the first half of 1914 affected miners, engineers, gas-workers, char-workers, municipal employees, dockers, transport-workers, coal-porters and many other groups of artisans. The absolute refusal to work with a non-unionist had so disorganized the London building trade that a stubborn struggle, which lasted for months, was begun by a general lockout in January. In May the railway servants decided to demand the recognition of their trade union, a 48 hours' week, and an increase of wages by 5s. weekly; and in June they gave a final approval to the "Triple Alliance" of their union with the Miners' Federation and the Transport Workers' Federation. The industrial prospect was dark.

Labour Unrest.

The opening of the year 1913 found Parliament still in session, and engaged in completing the final stages of the Home Rule and Welsh Disestablishment bills. The report stage of the Home Rule bill did not produce any serious amendment except the introduction of proportional representation in the nine proposed Irish constituencies returning three or four members. There was a notable debate on New Year's Day on Sir Edward Carson's motion to exclude the province of Ulster from the operation of the measure. Mr. Asquith, while expressing his readiness to consider additional safeguards, denounced the proposal as a claim by Ulster to veto Home Rule. Mr. Bonar Law solemnly promised support by the Unionist party to Ulster if the bill were forced on her and she resisted. The Government had its normal majority of about 100. The third reading debate on Jan. 15 and 16 did not reveal any new arguments, but Mr. Redmond stated that the Nationalists accepted the bill as a final settlement. In spite of Unionist predictions of immeasurable calamity, the third reading was carried by 367 to 257. The Lords debated the bill on second reading for four days (Jan. 27, 28, 29 and 30) before rejecting it by 326 to 69. The impossibility of working the scheme in face of the resistance of Ulster was the main ground put forward by the Unionists for rejection. But the most interesting feature of the debate was the strong advocacy by Lord Grey, ex-Governor-General of Canada, of a solution on federal lines—a proposal supported in a striking speech by the Archbishop of York (Dr. Lang). Neither the passing of the bill by the Commons, nor its rejection by the Lords, evoked any serious popular excitement.

Home Rule Bill rejected by the Lords.

Before the Welsh bill left the Commons its provisions were further mitigated in some slight degree. An amendment was adopted, favoured by Liberal churchmen, giving the Church body the option of commuting the life interests of the clergy on a 3% basis. There was a strong attempt made by the Unionists to confine the purposes to which the confiscated Church property should be applied to the advancement of the Christian religion by grants to Nonconformist churches. But, as the spokesmen of the Nonconformists repudiated the idea of concurrent endowment, the amendment was rejected by 273 to 200, though the Government agreed to limitation to charitable and eleemosynary purposes. The third reading was carried on Feb. 5 by the usual Government majority, after an eloquent exposition by Mr. Lloyd George of the sentiments of the Welsh people. The measure was debated on second reading by the Lords on Feb. 11, 12 and 13, and rejected by 252 to 51. Sixteen bishops voted in the majority; those of Hereford (Percival) and Oxford (Gore) in the minority.

Welsh Bill rejected by Lords.

The rejection of these two bills by the Lords, and the determination of ministers and of their majority in the Commons to override the veto of the Upper House through the use of the powers conferred by the Parliament Act, were the considerations governing the whole course of politics down to the outbreak of war. The main purpose of the sessions of 1913 and 1914 was to carry the two measures through the Commons a second and third time, so as to qualify them for passage into law in spite of the Lords. Feeling was naturally exacerbated by so high-handed a policy; especially as both bills, though apparently supported by the bulk of opinion in Ireland and Wales respectively, were strongly resisted by a majority of the parliamentary representatives of England, the predominant partner in each case. A recess of only three days separated the prorogation of the prolonged session of 1912 from the opening of the session of 1913 on March 10. The Opposition immediately joined issue on the Address by an amendment which asserted that the Irish and Welsh bills ought not to be proceeded with while the constitution of Parliament was still incomplete and without reference to the electors; but they were defeated by 262 to 169. The two controversial bills were carried for a second time through the Commons by the normal Government majority. As the Opposition resisted both measures in principle, no use was made of the limited opportunity for "suggestion" of amendments in Committee permitted by the Parliament Act. When the two bills came up to the House of Lords they were both met with identical resolutions that "this House declines to proceed with the consideration of the bill until it has been submitted to the judgment of the country." This was carried in the case of the Irish bill by 302 to 64; in that of the Welsh bill by 242 to 88. Thus the second stage for both under the Parliament Act was duly completed.

Second Stage of the Two Bills.

In all the debates on the Home Rule bill the Unionist leaders dwelt with insistence on the serious prospect before the country. We were "on the verge of a great national tragedy," said Mr. Balfour. The Liberals were crying peace where there was no peace, said Sir Edward Carson; Ulster had behind her in her resistance the whole force of the Conservative and Unionist party. The Liberals and Nationalists, however, still maintained that the Ulster attitude

The Menace of Ulster.

was largely bluff. Mr. Redmond on behalf of his party disclaimed any desire to establish ascendancy, and averred that Ulster would not be attacked. But the Unionists relied more on speeches in the great towns and on events in Ulster than on Parliament for the enlightenment of the country. Immediately after the division on the second reading, in June, Sir Edward Carson started on a political tour in Great Britain, making eloquent speeches in Glasgow, Edinburgh, Norwich, and Bristol—a demonstration which Mr. Redmond and his friends endeavoured to neutralize by following in the Ulster leader's footsteps. In July Sir Edward Carson spent several weeks in organization and speech-making in Belfast and the neighbourhood. He foreshadowed the establishment of a Provisional Government for Ulster, and assured his hearers that the Cabinet could not rely upon the army in forcing Home Rule upon them. Volunteers continued to drill, and provided themselves with the usual accompaniments of a modern army. More definite steps were taken in the autumn. On Sept. 25 the Ulster Unionist Council formally organized itself into a Provisional Government with a central authority whose chairman was Sir Edward Carson, and a guarantee fund intended to reach £1,000,000, to which the leader contributed £10,000. He formally reviewed the Volunteers, who then numbered 60,000 and increased to nearly 100,000 by the winter. On Nov. 3 there was a great demonstration in Belfast in favour of his policy by Ulster men of business, presided over by the president of the Belfast Chamber of Commerce. And on the 28th there was an enthusiastic meeting in his support in Dublin, where Mr. Law repeated his pledges to Ulster.

Suggestions for Settlement by Consent.

The Liberals retorted to these proceedings with jeers at "King Carson," and suggestions, which the Cabinet were too wise to accept, for his arrest. But many of them began to realize that there was a substantial difficulty in Ulster which could not be any longer ignored. Suggestions for a conference to arrange a compromise were thrown out in the Lords debate in July, and became more definite as the year drew towards a close. Mr. O'Brien, for the Independent Nationalists, pleaded for some such course; Lord Loreburn, the Liberal ex-Lord Chancellor, proposed it in *The Times* of Sept. 11; Lord Grey urged the advantages of a federal solution; and on Oct. 9, Mr. Churchill, an important member of the Cabinet, advocated at Dundee a solution by agreement. Though Mr. Redmond, on Oct. 12, refused to contemplate anything beyond an increase in the safeguards for the minority, Mr. Asquith, in his annual address to his constituents at Ladybank on Oct. 25, said that the Government were prepared to consider proposals within the scope of the bill; that they were anxious for a settlement by consent, not through a conference, but through a free and frank exchange of views. Two days later Sir Edward Grey, at Berwick, suggested that there might be a Home Rule for Ulster within Home Rule for Ireland. Mr. Law replied at Wallsend on Oct. 29 that he would consider any proposals with a real desire to find a solution, and Sir Edward Carson, who was present, expressed his agreement, but the offer must be consistent with the Covenant. A fortnight later, at Norwich, Mr. Law said it was the duty of the Government to submit their proposals to the judgment of the people either at a general election or by a referendum. Mr. Redmond, speaking at Newcastle-on-Tyne next day, described the Unionists as trying to intimidate the people of England. Still he expressed a preference for a settlement by consent, but it must be based on national self-government for Ireland. Mr. Lloyd George on Nov. 29 treated Unionist demonstrations against Home Rule as a red herring drawn across his campaign for social reform. There was much speaking on both sides during the last weeks of the year, but apparently no advance towards an agreement. Mr. Law said the sands were running out and nothing had been done, but Sir Edward Grey replied that there were still some months to spare. In the beginning of the new year Lord Curzon intimated at Manchester that the conversations between leaders had had no result. Sir Edward Carson went to Belfast and advised "peace but preparation," and Mr. Redmond assured his constituents at Waterford that the bill would that year automatically become law. The Unionists were strengthened in their resistance by some gains in by-elections during 1913 and early in 1914; but perhaps the most striking feature in the polls was the increasing support given to Labour at the expense of the Liberals.

Government Concessions.

It was in these conditions of doubt and apprehension that Parliament reassembled on Feb. 10 1914. The King's speech, while admitting that efforts at solution had so far failed, expressed a hope that they would yet succeed. Mr. Asquith laid stress upon these words in the debate on the Address. Sir Edward Carson said that, if the Government were in earnest, there must be an amending bill—a suggestion which Mr. Redmond ridiculed. No move was, however, made by the Government in the next week or two, and the organization of public opinion in England in support of Ulster was rapidly proceeded with. A British Covenant, similar to the Ulster Covenant, was promulgated on March 3, headed by the signatures of influential men, not closely identified with political party, such as Lord Roberts, Lord Halifax, Lord Milner, Prof. Dicey, Dean Wace, and Mr. Rudyard Kipling. A Woman's Covenant followed; and both documents were eagerly signed, an appreciable proportion of the signatures being professing Liberals. On March 9 Mr. Asquith, in moving for the third and last time the second reading of the Home Rule bill, announced the projected concessions. The Government would propose that any county in Ulster, including the county boroughs of Belfast and Londonderry, might vote itself out of the jurisdiction of the Irish Parliament for a term of six years, after which it would automatically come within that jurisdiction. The Prime Minister pointed out that, under the Parliament Act, there would necessarily be two general elections in Great Britain before the six years expired. This scheme of provisional exclusion entirely failed to satisfy either the Opposition or Ulster. Mr. Law said that, if this was the last word of the Government, the position was very grave; Ulster was asked to destroy her future. Mr. Redmond insisted that this was the extreme limit of concession; and the Independent Nationalists protested vehemently against partition. Sir Edward Carson took note of the gain involved in admitting the principle of exclusion, but said emphatically "We don't want sentence of death with a stay of execution for six years." The situation became sensibly graver when Mr. Churchill at Bradford, on March 14, said that the Prime Minister's offer appeared to him to be final, reproached the Unionists and Ulster for not being satisfied with it, and maintained that, in the event of violence, the larger issue, between parliamentary government and armed force, once fought out at Marston Moor, would become dominant. If there was any attempt in action to subvert parliamentary government there was no lawful measure from which the Cabinet would shrink. They had sent out soldiers during the railway strike with Unionist approval. If the British civil and parliamentary systems were to be brought to the challenge of force, he could only say "Let us go forward together and put these grave matters to the proof." This utterance, which was endorsed a few days later by Mr. Lloyd George, and the refusal of the Prime Minister to give details of his proposals unless the general principle were adopted, led to an Opposition motion of censure on March 19. In the debate Mr. Law made a formal offer: if the new suggestions were put into the Home Rule bill and accepted by the country on a referendum, he had Lord Lansdowne's authority to say that, so far as his influence in the House of Lords went, he would not oppose the will of the people. This Mr. Asquith would not accept. Sir Edward Carson then left the House, amid a great Unionist demonstration, and, accompanied by eight Irish Unionist members, proceeded to Ulster.

The Army and Ulster.

An explosion in some form seemed to be imminent. Mr. Law had said in the censure debate that, in a case merely of disorder, the army would and ought to obey; if it were a question of civil war, "soldiers are citizens like the rest of us." This was speedily proved. It was determined to protect certain military stores in the N. of Ireland from possible raids by Ulster Volunteers, ahd a considerable

force was ordered on March 20 to move N. from Dublin with naval support. To the officers on duty at the Curragh this appeared to be the beginning of a movement to coerce Ulster by the army—an impression which was confirmed by certain questions asked them and alternatives put before them; and Gen. Sir Hubert Gough, in command of the cavalry brigade, with many of his subordinate officers, preferred to accept dismissal rather than initiate active military operations against Ulster. They were informed by the General Officer Commanding that it was merely a measure of precaution, and the senior officers concerned were ordered to report themselves at the War Office. There, in answer to a letter in which Gen. Gough asked the Adjutant-General to make clear whether, if the Home Rule bill became law, the officers " could be called upon to enforce it in Ulster under the expression of maintaining law and order," the following minute (dated March 23 1914) was written in reply, initialled by the Secretary of State, the Chief of the General Staff (Sir John French), and the Adjutant-General:—

You are authorized by the Army Council to inform the officers of the 3rd Cavalry Brigade, that the Army Council are satisfied that the incident which has arisen in regard to their resignations has been due to a misunderstanding. It is the duty of all soldiers to obey lawful commands given to them through the proper channel by the Army Council, either for the protection of public property and the support of the civil power in the event of disturbances or for the protection of the lives and property of the inhabitants. This is the only point it was intended to be put to the officers in the questions of the General Officer Commanding, and the Army Council have been glad to learn from you that there never has been and never will be in the Brigade any question of disobeying such lawful orders. His Majesty's Government must retain their right to use all the forces of the Crown in Ireland, or elsewhere, to maintain law and order and to support the civil power in the ordinary execution of its duty. But they have no intention whatever of taking advantage of this right to crush political opposition to the policy or principles of the Home Rule bill.

On receiving this document Gen. Gough asked Sir John French if it meant that he would not be called on to order his brigade to assist in coercing Ulster to submit to Home Rule, and Sir John French wrote across it, " I should read it so." The precautionary movements were carried out and all orders were duly obeyed.

These facts came out gradually in the week following Sir Edward Carson's removal from Westminster to Belfast, and there were many scenes and much recrimination in the House of Commons. On hearing the news of the officers' action, the Unionists asserted that there was obviously a plot to provoke Ulster, which the reluctance of the officers had defeated; the Prime Minister replied that the movement of troops was purely protective, and that, if officers and soldiers were to discriminate between the validity of different laws, the fabric of society would crumble; while the Labour party claimed that, as any option given to officers must logically be extended to men, the army could no longer be used in labour troubles. When the minute of the Army Council was published the Liberals were dismayed, while the Unionists accepted it as making the coercion of Ulster impossible. Ministers explained to their bewildered followers that the first three paragraphs were settled by the Cabinet, but that the last two, which, in connexion with Gen. Gough's letter, seemed to constitute a bargain with the officers in regard to a hypothetical contingency, had been added by the War Secretary without Cabinet authority. Amid prolonged Liberal and Labour cheers Mr. Asquith repudiated any bargain of the kind, and caused a new army order to be issued, under the heading " Discipline," as follows:—

Parties and the Army.

1. No officer or soldier should in future be questioned by his superior officer as to the attitude he will adopt or as to his action in the event of his being required to obey orders dependent on future or hypothetical contingencies.

2. An officer or soldier is forbidden in future to ask for assurances as to orders which he may be required to obey.

3. In particular it is the duty of every officer and soldier to obey all lawful commands given to them through the proper channel, either for the safeguarding of public property, or the support of the civil power in the ordinary execution of its duty, or for the protection of the lives and property of the inhabitants in the case of disturbance of the peace.

Ministers did not seem to be prepared for the natural result of these proceedings, the resignation of the three members of the Army Council who had initialled the minute of March 23—Col Seely (the War Minister), Sir John French, and Sir Spencer Ewart. The Prime Minister endeavoured to persuade all three to reconsider their determination, as there was, in his view, no difference of opinion amongst them; but, having failed, he assumed himself the office of Secretary of State for War in addition to that of First Lord of the Treasury. In an address to his constituents on seeking reëlection, he illustrated the spirit in which he proposed to act by quoting the words of Chatham: " The army will hear nothing of politics from me, and in return I expect to hear nothing of politics from the army." The Unionists noted with satisfaction that both Col. Seely himself, and Lord Morley who assisted in drafting the peccant paragraphs, stated that they did not see that these differed in spirit and substance from the three preceding paragraphs. The conclusion seemed to be that the Government repudiated the intention to make use of the army " to crush political opposition to the policy or principles of the Home Rule bill." A gigantic demonstration of protest against the coercion of Ulster was held on April 4 in Hyde Park; there were 22 separate processions and 14 platforms, and men of the public eminence of Mr. Balfour, Sir Edward Carson, and Lord Milner attended and spoke. The gravity of the situation led to many expressions in the Home Rule debate of a desire for an agreed settlement. Sir Edward Carson said there was only one policy possible: " Leave Ulster out until you have won her consent to come in." But ministers would not advance beyond their previous proposals, and the second reading was carried by 80 votes, as compared with majorities of 110 and 100 in the previous year. There was a similar decline in the majority for the second reading of the Welsh bill.

Mr Asquith as War Secretary.

Meanwhile events were moving in Ireland. Easter week saw a series of reviews by Sir Edward Carson of large bodies of Ulster Volunteers; and on the night of April 24–25 some 35,000 rifles and 3,000,000 cartridges were landed at Larne and distributed throughout the Protestant north. This successful feat of gun-running, and the publication of papers with regard to the alleged military " plot," produced heated debates in Parliament, followed, however, by further private negotiations between leaders. Before the third reading of the Home Rule bill, the Prime Minister gave notice that the Government would introduce—in the House of Lords—an Amending bill, which might pass simultaneously with the Home Rule bill. It was only, however, after a scene of disorder in the House of Commons that he disclosed its nature: it would give effect to the terms of agreement if arrived at, and, if not, to the proposals outlined on March 9. This was far from satisfying the Opposition, and the third reading of the Home Rule bill was only carried by 351 to 274, that of the Welsh bill having been secured by 328 to 251.

Determination of Ulster.

The two bills left the Commons before the Whitsuntide recess, which was spent by Sir Edward Carson in Ulster in making " preparations for the final scene." While there was every sign of resolute determination about Ulster and her Volunteers, Nationalist Ireland had retorted by enrolling Volunteers of her own, who were estimated to exceed 100,000 men. This force was started independently of the official Nationalists, and it was only with some difficulty that Mr. Redmond obtained control by the end of June. There were thus two armed bodies of many thousands of men facing each other in Ireland in a state of what Lord Milner called " smouldering war. " In these alarming circumstances the Amending bill, introduced in the Lords on June 23, which merely offered option of exclusion by counties for six years, seemed inadequate. It was read a second time in the beginning of July, after a prolonged debate, in the course of which Lord Roberts warned the Government that any attempt to use the military forces of the nation to coerce Ulster would break and ruin the army. In committee the Unionist majority transformed the measure by amendments

Approach of Civil War.

The Amending Bill.

permanently excluding the whole province of Ulster, Nationalist counties no less than Unionist, from the operation of the Home Rule bill. It was certain that the Liberal and Nationalist majority in the Commons would indignantly reject this solution. At the same time the urgency of the Ulster problem was again enforced by enormous demonstrations on the Boyne anniversary, emphasizing Sir Edward Carson's words: "Give us a clear cut or come and fight us."

The Amending bill was to be taken in the Commons on Monday July 20; but the King and the wiser heads in the Cabinet were determined to make a further effort for peace; and on that morning *The Times* announced that the King had issued invitations to a conference on the Ulster question at Buckingham Palace, consisting of two members each from the Government, the Opposition, the Nationalists and the Ulster Covenanters. Moderate men in all parties hailed the announcement with relief; but keen partisans were suspicious and critical. The conference met on Tuesday under the chairmanship of the Speaker. The Government were represented by Mr. Asquith and Mr. Lloyd George; the Opposition by Lord Lansdowne and Mr. Bonar Law; the Nationalists by Mr. Redmond and Mr. Dillon; and the Ulstermen by Sir Edward Carson and Capt. Craig. The King opened the proceedings in a brief but weighty speech. He said:

Conference at Buckingham Palace.

"My intervention at this moment may be regarded as a new departure. But the exceptional circumstances under which you are brought together justify my action. For months we have watched with deep misgivings the course of events in Ireland. The trend has been surely and steadily towards an appeal to force, and to-day the cry of civil war is on the lips of the most responsible and soberminded of my people."

His Majesty urged on the conference "a spirit of generous compromise," reminded them that the time was short, and expressed his confidence that they would be patient, earnest and conciliatory. In spite of a considerable display of these qualities, the conference failed. The members met on four days, from Tuesday to Friday, and at the close the Speaker announced that they had been unable to agree, either in principle or in detail, on the area to be excluded from the operation of the Home Rule bill. It was understood that the deadlock arose over the question of the exclusion of Fermanagh and Tyrone, both of them counties greatly divided in political opinion. The position seemed to be desperate, and passions were once more fiercely excited by a fatal affray in Dublin on the following Sunday between British soldiers and the populace—an affray which followed on a successful gunrunning on a considerable scale by the National Volunteers. The Amending bill was put down for July 30, and a great Liberal meeting in the London Opera House on the previous day urged the Government to go forward with their programme. But already the international crisis precipitated by Austria's attack on Serbia had become too serious to admit of the continuance of domestic strife. The Amending bill was indefinitely postponed, and civil war was averted by a gigantic European conflict.

The bitterness introduced into politics by the Parliament Act led, during the last years of peace, to frequent rumours and accusations of irregular if not corrupt dealings by individual ministers in regard, now to silver, now to oil, now to wireless telegraphy. Only, however, in one instance did there appear to be any foundation for the suggestions of improper action. In April 1912, after the Postmaster-General had accepted a tender for the erection of wireless stations by the Marconi Co., the Attorney-General (Sir Rufus Isaacs, afterwards Lord Reading) bought 10,000 shares in the American Marconi Co., a separate company which, it was contended, did not benefit by the contract, and sold 1,000 each to two friends in the Government—the Chancellor of the Exchequer (Mr. Lloyd George) and the Chief Whip (Lord Murray of Elibank). Some of these shares were resold by their purchasers in the next few days at a profit, but the total net result of the transaction after a year was a loss. The advice to purchase had been given to Sir Rufus by his brother Mr. Godfrey Isaacs, managing director of the American company, and also of the English company. These facts were not told to the House of Commons when in the previous autumn the Marconi contract was discussed and a committee was appointed to inquire into it. They only came out in March 1913 during the trial of an action for libel against a French newspaper which had given currency to the rumours of corruption that were rife throughout the winter. Thereupon the Attorney-General and the Chancellor of the Exchequer appeared before the committee and explained what they had done. Lord Murray, who had bought further shares in the company on behalf of the Liberal party fund, was abroad. The committee found that the gross charges of corruption were unfounded, but could not agree upon a united report. The majority, consisting of Liberal, Labour, and Nationalist members, awarded no blame to any one except those who circulated the charges of corruption, thereby setting aside their Liberal chairman's draft report, which concluded that ministers had been ill-advised both in their purchase of shares and in their delay in disclosing the facts. The minority, consisting of Unionist members only, found that ministers had acted with grave impropriety. In the debate which followed in the House of Commons on June 18 and 19, both the Attorney-General and the Chancellor of the Exchequer, while protesting their good faith throughout the transaction, admitted that the original purchase was indiscreet, and that the delay in disclosure was a mistake of judgment. After a heated discussion, during which the Unionists vainly endeavoured to secure the passing of some amendment expressing the regret of Parliament for what ministers admitted to be indiscretions, a motion was carried by 346 to 268 accepting the two ministers' statements and reprobating the charges of corruption. Public opinion was more severe than Parliament. It was shocked that important ministers, and especially the guardian of the Treasury, should show themselves so wanting in delicacy and prudence in pecuniary matters. Subsequently in the House of Lords Lord Murray admitted that his action had not been wise or correct, but a committee of that House unanimously found that he had done nothing that reflected on his personal honour.

The Marconi "Scandal."

Mr. Lloyd George at once endeavoured to divert attention from his own indiscretions to the shortcomings of the landlords. What humbug it was for Conservatives, he said, in a speech on July 1 at a luncheon given to himself and the Attorney-General at the National Liberal Club, to set up an ideal standard for Liberal ministers, when it was notorious that parliaments of landlords in the past had been guided in their legislation by their private interests! The Radical land campaign, started in the previous year, was pushed on, and the subject formed the staple of Mr. Lloyd George's numerous speeches in the country in the autumn of 1913. The Unionists countered the movement by a programme of their own (explained by Lord Lansdowne at Matlock on June 21), which involved the encouragement of small ownership, and the provision of advances by the State to assist the building of cottages and the purchase by tenants of their holdings. At Swindon, on Oct. 22, Mr. Lloyd George announced the ministerial scheme. The Government proposed to set up a Ministry of Lands to take over the functions of the Board of Agriculture, together with registration of title, settled estates, and land valuation—in short to have a general supervision of land and of all dealings with it of whatever kind. Commissioners, having a judicial character, would be appointed, who would be given large compulsory powers in respect of rent, eviction, compensation for improvements, and wages. Tenants would be protected against damage by game. The new ministry would have power to acquire at a reasonable price all waste, derelict, and neglected lands, and to afforest, reclaim, equip, and cultivate them. Housing and cheap transit were also to be provided. While Unionists denounced the extravagance of the scheme, and the "horde of officials" with despotic powers which it proposed to set up, they did not take it very seriously. The event proved them to be right. But Mr. Lloyd George took advantage of his budget for the next year, 1914, to advance his programme of social reform in other ways. He made provision for an extended series of grants to local authorities

The Land Campaign.

The Budget of 1914.

for various sanitary and educational purposes, and he largely increased the sum allocated to national insurance. In order to obtain the necessary funds he proposed to establish a national system of valuation for local taxation, separating site from improvement values; he increased the income tax and supertax, and took a million from the sinking fund. The proposals, though welcomed by Radicals and Labour men, were not popular with many of his own party; and he had to give up an extra penny on the income tax, and postpone the operation of most of his increased grants for a year; and even so, he only escaped defeat on an Opposition amendment by 303 to 265 votes.

Royal and Presidential Visits. During 1913 and the first seven months of 1914 the King and Queen strengthened their hold on the loyalty of their subjects by popular progresses through the Potteries in April, through Lancs. in July 1913, through the Midlands in June, and through the Lowlands of Scotland in July 1914. They also took the occasion of the marriage of their cousin Prince Ernest Augustus of Cumberland to the Kaiser's daughter to pay a courteous visit in May 1913 to Berlin, where they were courteously received. Of more political importance was the State visit of President Poincaré to London, in the following June, as the King's guest. The cordiality of the official welcome was reflected in the enthusiasm of the people in the streets. In April 1914, the King and Queen, accompanied by the Foreign Minister, paid a return visit to Paris, where they were welcomed with similar enthusiasm by President and people. It was felt in both countries that by these mutual visits the system of friendly coöperation between France and England had received a fresh ratification.

Lord Roberts and National Defence. Uneasiness as to the national defences in view of the naval preparations and restless diplomacy of Germany gave a considerable impetus during 1913 to Lord Roberts' campaign for universal military service. In spite of his advanced age he addressed great meetings in large provincial towns—at Bristol in Feb., at Wolverhampton in March, at Leeds in April, and at Glasgow in May—being everywhere received with respect and even enthusiasm. But no party, as a party, was prepared to take up his cause, which received little support from the organized workers; and the Government, by the mouth of Col. Seely, the War Minister, denounced compulsory service as "a political and military disaster." They pinned their faith to the Territorial Force, which Lord Haldane had created. The reluctance of many patriotic men to aid Lord Roberts' movement was due to a fear lest compulsory service should divert effort and money from the navy, the principal defensive force of Great Britain. In introducing the navy estimates for 1913, which involved an increase of over a million, Mr. Churchill, the First Lord of the Admiralty, threw out a suggestion that the Powers who were building ships in competition with each other might all take "a naval holiday" for a year; but the idea met with no response.

Naval and Military Preparation. In spite of this lack of response, the Chancellor of the Exchequer, in an interview published Jan. 1 1914, called loudly for a reconsideration of the expenditure on armaments. A large section of the Liberal party, whose spokesman was Sir John Brunner, chairman of the National Liberal Federation, strongly supported Mr. Lloyd George. But neither in the Cabinet, nor with the nation at large, did this view prevail. Sir Edward Grey said at Manchester on Feb. 3, that to reduce the British naval programme would be staking too much on a gambling chance. The navy estimates introduced in March by Mr. Winston Churchill were the largest on record, amounting to £51,550,000; and yet they were attacked by Lord Charles Beresford and by the Unionists generally, with considerable public support, as insufficient. On the army estimates, which also showed a slight increase, Col. Seely declared that the British army was much better trained and was much more formidable as a fighting machine than any continental army, and that the Expeditionary Force was absolutely ready. The power and readiness of the fleet were shown by a great review and test mobilization, on a scale never seen before, at Spithead in the third week of July.

III. The War Period

Britain and the Crisis. The murder of the Archduke Francis Ferdinand at Sarajevo on June 28 horrified public opinion in Great Britain, and led to the expression, in Parliament and elsewhere, of much sympathy for the aged Emperor Francis Joseph. But comparatively few Englishmen realized that the crime might start a general conflagration in Europe; and the weeks which elapsed before Austria made any overt move encouraged the belief that the effects would be isolated and localized. Even the drastic and peremptory ultimatum addressed by Austria to Serbia on July 23 failed to impress the public with a due sense of its gravity, absorbed as they were in the Buckingham Palace Conference of July 21–4, in the Dublin shooting affray of July 26, and in the apparent imminence of civil war in Ireland. It was only in the very last days of July that Austria's rejection of Serbia's conciliatory reply and her immediate declaration of war, followed rapidly by the Russian and German mobilizations, and by the evidence of French resolve to rally to France's ally Russia, aroused the British people to the fact that a great European war was impending. Even then the general expectation was that Great Britain would not be involved in it. On July 27 Sir Edward Grey gave Parliament an account of his anxious and earnest endeavours to bring the Powers together and avert hostilities. On July 30 the Prime Minister announced that the Government were doing their best to "circumscribe the area of possible conflict." At last on July 31 Mr. Asquith postponed the Irish Amending bill and all controversial business, announced that the issues of peace and war were hanging in the balance, and that it was of vital importance that Great Britain should present a united front. Mr. Bonar Law expressed his full agreement, stating that he spoke for Ulstermen as well as for Unionists.

Division of Opinion. The implications of the entente with France and of the subsequent understanding with Russia were not generally grasped even yet. Serbia had few sympathizers in England, the brutal murders of King Alexander and his Queen having never been forgotten. Germany's apparent reasonableness in the Balkan negotiations had lulled for the time public and even ministerial suspicions of her designs. Some leading journals, and notably *The Times*, did yeoman's work in insisting on the necessity, even from the most selfish point of view, of Britain standing by France. The principal Liberal journals, however, notably the *Daily News* and *Manchester Guardian*, protested vehemently against any departure from neutrality. The Cabinet were as divided as the public, the bulk of the more Radical members pronouncing for neutrality, while Sir E. Grey, supported by the Prime Minister and others, insisted on British obligations to France. In consequence Sir E. Grey could not give, on July 31, the promise to coöperate with France for which M. Cambon, the French ambassador, asked; nor could the King respond in anything except friendly generalities to an earnest appeal from the French President. But on Saturday Aug. 1, the day on which Germany declared war on France, there was a hurried summons of such members of the Unionist Opposition

Unionist Attitude. as could be collected at the week's end, and as a result of their meeting Mr. Bonar Law wrote on the Sunday to the Prime Minister as follows:—

"Lord Lansdowne and I feel it our duty to inform you that in our opinion, as well as in that of all the colleagues whom we have been able to consult, it would be fatal to the honour and security of the United Kingdom to hesitate in supporting France and Russia at the present juncture; and we offer our unhesitating support to the Government in any measures they may consider necessary for that object."

Sir E. Grey's Speech of Aug. 3. This, the natural outcome of the patriotic support which, in spite of acute domestic differences, the Opposition had throughout afforded to the foreign policy of Sir E. Grey, immensely strengthened the stalwarts in the Cabinet: and the evasion by Germany of Sir E. Grey's demand that she should respect the neutrality of Belgium helped them still more. Accordingly, on Monday Aug. 3 the Foreign Minister was in a position to make a speech of vast historic moment, inviting the House of Commons to act up to the obli-

permanently excluding the whole province of Ulster, Nationalist counties no less than Unionist, from the operation of the Home Rule bill. It was certain that the Liberal and Nationalist majority in the Commons would indignantly reject this solution. At the same time the urgency of the Ulster problem was again enforced by enormous demonstrations on the Boyne anniversary, emphasizing Sir Edward Carson's words: "Give us a clear cut or come and fight us."

The Amending bill was to be taken in the Commons on Monday July 20; but the King and the wiser heads in the Cabinet were determined to make a further effort for peace; and on that morning *The Times* announced that the King had issued invitations to a conference on the Ulster question at Buckingham Palace, consisting of two members each from the Government, the Opposition, the Nationalists and the Ulster Covenanters. Moderate men in all parties hailed the announcement with relief; but keen partisans were suspicious and critical. The conference met on Tuesday under the chairmanship of the Speaker. The Government were represented by Mr. Asquith and Mr. Lloyd George; the Opposition by Lord Lansdowne and Mr. Bonar Law; the Nationalists by Mr. Redmond and Mr. Dillon; and the Ulstermen by Sir Edward Carson and Capt. Craig. The King opened the proceedings in a brief but weighty speech. He said:

Conference at Buckingham Palace.

"My intervention at this moment may be regarded as a new departure. But the exceptional circumstances under which you are brought together justify my action. For months we have watched with deep misgivings the course of events in Ireland. The trend has been surely and steadily towards an appeal to force, and to-day the cry of civil war is on the lips of the most responsible and soberminded of my people."

His Majesty urged on the conference "a spirit of generous compromise," reminded them that the time was short, and expressed his confidence that they would be patient, earnest and conciliatory. In spite of a considerable display of these qualities, the conference failed. The members met on four days, from Tuesday to Friday, and at the close the Speaker announced that they had been unable to agree, either in principle or in detail, on the area to be excluded from the operation of the Home Rule bill. It was understood that the deadlock arose over the question of the exclusion of Fermanagh and Tyrone, both of them counties greatly divided in political opinion. The position seemed to be desperate, and passions were once more fiercely excited by a fatal affray in Dublin on the following Sunday between British soldiers and the populace—an affray which followed on a successful gunrunning on a considerable scale by the National Volunteers. The Amending bill was put down for July 30, and a great Liberal meeting in the London Opera House on the previous day urged the Government to go forward with their programme. But already the international crisis precipitated by Austria's attack on Serbia had become too serious to admit of the continuance of domestic strife. The Amending bill was indefinitely postponed, and civil war was averted by a gigantic European conflict.

The bitterness introduced into politics by the Parliament Act led, during the last years of peace, to frequent rumours and accusations of irregular if not corrupt dealings by individual ministers in regard, now to silver, now to oil, now to wireless telegraphy. Only, however, in one instance did there appear to be any foundation for the suggestions of improper action. In April 1912, after the Postmaster-General had accepted a tender for the erection of wireless stations by the Marconi Co., the Attorney-General (Sir Rufus Isaacs, afterwards Lord Reading) bought 10,000 shares in the American Marconi Co., a separate company which, it was contended, did not benefit by the contract, and sold 1,000 each to two friends in the Government—the Chancellor of the Exchequer (Mr. Lloyd George) and the Chief Whip (Lord Murray of Elibank). Some of these shares were resold by their purchasers in the next few days at a profit, but the total net result of the transaction after a year was a loss. The advice to purchase had been given to Sir Rufus by his brother Mr. Godfrey Isaacs, managing director of the American company, and also of the English company. These facts were not told to the House of Commons when in the previous autumn the Marconi contract was discussed and a committee was appointed to inquire into it. They only came out in March 1913 during the trial of an action for libel against a French newspaper which had given currency to the rumours of corruption that were rife throughout the winter. Thereupon the Attorney-General and the Chancellor of the Exchequer appeared before the committee and explained what they had done. Lord Murray, who had bought further shares in the company on behalf of the Liberal party fund, was abroad. The committee found that the gross charges of corruption were unfounded, but could not agree upon a united report. The majority, consisting of Liberal, Labour, and Nationalist members, awarded no blame to any one except those who circulated the charges of corruption, thereby setting aside their Liberal chairman's draft report, which concluded that ministers had been ill-advised both in their purchase of shares and in their delay in disclosing the facts. The minority, consisting of Unionist members only, found that ministers had acted with grave impropriety. In the debate which followed in the House of Commons on June 18 and 19, both the Attorney-General and the Chancellor of the Exchequer, while protesting their good faith throughout the transaction, admitted that the original purchase was indiscreet, and that the delay in disclosure was a mistake of judgment. After a heated discussion, during which the Unionists vainly endeavoured to secure the passing of some amendment expressing the regret of Parliament for what ministers admitted to be indiscretions, a motion was carried by 346 to 268 accepting the two ministers' statements and reprobating the charges of corruption. Public opinion was more severe than Parliament. It was shocked that important ministers, and especially the guardian of the Treasury, should show themselves so wanting in delicacy and prudence in pecuniary matters. Subsequently in the House of Lords Lord Murray admitted that his action had not been wise or correct, but a committee of that House unanimously found that he had done nothing that reflected on his personal honour.

The Marconi "Scandal."

Mr. Lloyd George at once endeavoured to divert attention from his own indiscretions to the shortcomings of the landlords. What humbug it was for Conservatives, he said, in a speech on July 1 at a luncheon given to himself and the Attorney-General at the National Liberal Club, to set up an ideal standard for Liberal ministers, when it was notorious that parliaments of landlords in the past had been guided in their legislation by their private interests! The Radical land campaign, started in the previous year, was pushed on, and the subject formed the staple of Mr. Lloyd George's numerous speeches in the country in the autumn of 1913. The Unionists countered the movement by a programme of their own (explained by Lord Lansdowne at Matlock on June 21), which involved the encouragement of small ownership, and the provision of advances by the State to assist the building of cottages and the purchase by tenants of their holdings. At Swindon, on Oct. 22, Mr. Lloyd George announced the ministerial scheme. The Government proposed to set up a Ministry of Lands to take over the functions of the Board of Agriculture, together with registration of title, settled estates, and land valuation—in short to have a general supervision of land and of all dealings with it of whatever kind. Commissioners, having a judicial character, would be appointed, who would be given large compulsory powers in respect of rent, eviction, compensation for improvements, and wages. Tenants would be protected against damage by game. The new ministry would have power to acquire at a reasonable price all waste, derelict, and neglected lands, and to afforest, reclaim, equip, and cultivate them. Housing and cheap transit were also to be provided. While Unionists denounced the extravagance of the scheme, and the "horde of officials" with despotic powers which it proposed to set up, they did not take it very seriously. The event proved them to be right. But Mr. Lloyd George took advantage of his budget for the next year, 1914, to advance his programme of social reform in other ways. He made provision for an extended series of grants to local authorities

The Land Campaign.

The Budget of 1914.

for various sanitary and educational purposes, and he largely increased the sum allocated to national insurance. In order to obtain the necessary funds he proposed to establish a national system of valuation for local taxation, separating site from improvement values; he increased the income tax and supertax, and took a million from the sinking fund. The proposals, though welcomed by Radicals and Labour men, were not popular with many of his own party; and he had to give up an extra penny on the income tax, and postpone the operation of most of his increased grants for a year; and even so, he only escaped defeat on an Opposition amendment by 303 to 265 votes.

Royal and Presidential Visits.

During 1913 and the first seven months of 1914 the King and Queen strengthened their hold on the loyalty of their subjects by popular progresses through the Potteries in April, through Lancs. in July 1913, through the Midlands in June, and through the Lowlands of Scotland in July 1914. They also took the occasion of the marriage of their cousin Prince Ernest Augustus of Cumberland to the Kaiser's daughter to pay a courteous visit in May 1913 to Berlin, where they were courteously received. Of more political importance was the State visit of President Poincaré to London, in the following June, as the King's guest. The cordiality of the official welcome was reflected in the enthusiasm of the people in the streets. In April 1914, the King and Queen, accompanied by the Foreign Minister, paid a return visit to Paris, where they were welcomed with similar enthusiasm by President and people. It was felt in both countries that by these mutual visits the system of friendly coöperation between France and England had received a fresh ratification.

Lord Roberts and National Defence.

Uneasiness as to the national defences in view of the naval preparations and restless diplomacy of Germany gave a considerable impetus during 1913 to Lord Roberts' campaign for universal military service. In spite of his advanced age he addressed great meetings in large provincial towns—at Bristol in Feb., at Wolverhampton in March, at Leeds in April, and at Glasgow in May—being everywhere received with respect and even enthusiasm. But no party, as a party, was prepared to take up his cause, which received little support from the organized workers; and the Government, by the mouth of Col. Seely, the War Minister, denounced compulsory service as "a political and military disaster." They pinned their faith to the Territorial Force, which Lord Haldane had created. The reluctance of many patriotic men to aid Lord Roberts' movement was due to a fear lest compulsory service should divert effort and money from the navy, the principal defensive force of Great Britain. In introducing the navy estimates for 1913, which involved an increase of over a million, Mr. Churchill, the First Lord of the Admiralty, threw out a suggestion that the Powers who were building ships in competition with each other might all take "a naval holiday" for a year; but the idea met with no response.

Naval and Military Preparation.

In spite of this lack of response, the Chancellor of the Exchequer, in an interview published Jan. 1 1914, called loudly for a reconsideration of the expenditure on armaments. A large section of the Liberal party, whose spokesman was Sir John Brunner, chairman of the National Liberal Federation, strongly supported Mr. Lloyd George. But neither in the Cabinet, nor with the nation at large, did this view prevail. Sir Edward Grey said at Manchester on Feb. 3, that to reduce the British naval programme would he staking too much on a gambling chance. The navy estimates introduced in March by Mr. Winston Churchill were the largest on record, amounting to £51,550,000; and yet they were attacked by Lord Charles Beresford and by the Unionists generally, with considerable public support, as insufficient. On the army estimates, which also showed a slight increase, Col. Seely declared that the British army was much better trained and was much more formidable as a fighting machine than any continental army, and that the Expeditionary Force was absolutely ready. The power and readiness of the fleet were shown by a great review and test mobilization, on a scale never seen before, at Spithead in the third week of July.

III. The War Period

Britain and the Crisis.

The murder of the Archduke Francis Ferdinand at Sarajevo on June 28 horrified public opinion in Great Britain, and led to the expression, in Parliament and elsewhere, of much sympathy for the aged Emperor Francis Joseph. But comparatively few Englishmen realized that the crime might start a general conflagration in Europe; and the weeks which elapsed before Austria made any overt move encouraged the belief that the effects would be isolated and localized. Even the drastic and peremptory ultimatum addressed by Austria to Serbia on July 23 failed to impress the public with a due sense of its gravity, absorbed as they were in the Buckingham Palace Conference of July 21–4, in the Dublin shooting affray of July 26, and in the apparent imminence of civil war in Ireland. It was only in the very last days of July that Austria's rejection of Serbia's conciliatory reply and her immediate declaration of war, followed rapidly by the Russian and German mobilizations, and by the evidence of French resolve to rally to France's ally Russia, aroused the British people to the fact that a great European war was impending. Even then the general expectation was that Great Britain would not be involved in it. On July 27 Sir Edward Grey gave Parliament an account of his anxious and earnest endeavours to bring the Powers together and avert hostilities. On July 30 the Prime Minister announced that the Government were doing their best to "circumscribe the area of possible conflict." At last on July 31 Mr. Asquith postponed the Irish Amending bill and all controversial business, announced that the issues of peace and war were hanging in the balance, and that it was of vital importance that Great Britain should present a united front. Mr. Bonar Law expressed his full agreement, stating that he spoke for Ulstermen as well as for Unionists.

Division of Opinion.

The implications of the entente with France and of the subsequent understanding with Russia were not generally grasped even yet. Serbia had few sympathizers in England, the brutal murders of King Alexander and his Queen having never been forgotten. Germany's apparent reasonableness in the Balkan negotiations had lulled for the time public and even ministerial suspicions of her designs. Some leading journals, and notably *The Times*, did yeoman's work in insisting on the necessity, even from the most selfish point of view, of Britain standing by France. The principal Liberal journals, however, notably the *Daily News* and *Manchester Guardian*, protested vehemently against any departure from neutrality. The Cabinet were as divided as the public, the bulk of the more Radical members pronouncing for neutrality, while Sir E. Grey, supported by the Prime Minister and others, insisted on British obligations to France. In consequence Sir E. Grey could not give, on July 31, the promise to coöperate with France for which M. Cambon, the French ambassador, asked; nor could the King respond in anything except friendly generalities to an earnest appeal from the French President. But on Saturday Aug. 1, the day on which Germany declared war on France, there was a hurried summons of such members of the Unionist Opposition as could be collected at the week's end, and as a result of their meeting Mr. Bonar Law wrote on the Sunday to the Prime Minister as follows:—

Unionist Attitude.

"Lord Lansdowne and I feel it our duty to inform you that in our opinion, as well as in that of all the colleagues whom we have been able to consult, it would be fatal to the honour and security of the United Kingdom to hesitate in supporting France and Russia at the present juncture; and we offer our unhesitating support to the Government in any measures they may consider necessary for that object."

Sir E. Grey's Speech of Aug. 3.

This, the natural outcome of the patriotic support which, in spite of acute domestic differences, the Opposition had throughout afforded to the foreign policy of Sir E. Grey, immensely strengthened the stalwarts in the Cabinet: and the evasion by Germany of Sir E. Grey's demand that she should respect the neutrality of Belgium helped them still more. Accordingly, on Monday Aug. 3 the Foreign Minister was in a position to make a speech of vast historic moment, inviting the House of Commons to act up to the obli-

country in his speech at the Guildhall on Lord Mayor's Day. Britain, he said, would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed.

Meanwhile England was feeling day by day more and more what it meant to be at war. On the coasts, and especially the east coast, houses were destroyed which might either obstruct the British line of fire or serve as landmarks for a hostile fleet; lamps were extinguished on the sea front and all streets leading to it; no lights were allowed to be shown from private houses; and lighthouses and lightships were temporarily extinguished. The development of air warfare shortly caused the streets of London and all towns accessible from the east to be darkened, and searchlights, special guns, and an increasing number of air machines to be held in readiness against attack; while all trains in the south-eastern quarter of England had to have their blinds drawn after nightfall. The fall of Antwerp and the loss of the Belgian coast to the enemy brought the imminence of the danger home. These events in Belgium brought also a great accession to the number of Belgian refugees who had already sought shelter in England, and a vast organization of public and private benevolence catered for their needs. On the other hand, public opinion in England was cheered about this time by the arrival of the first contingent of Canadian troops, the forerunner of a mighty force from all the Dominions; and by the appearance in the battle line in France of native troops from India. This was unfortunately succeeded by the news of the defeat of Adml. Cradock at Coronel.

War Conditions.

The new parliamentary session, which opened on Nov. 11, followed immediately upon a serious development of the conflict—the entry of Turkey into the war as an ally of the Central Powers (which had as one result the proclamation of Egypt as a British Protectorate). The King, in his Speech, said that "the only measures which will be submitted to you, at this stage of the session, are such as seem necessary to my advisers for the attainment of the great purpose upon which the efforts of the Empire are set." The most burning question of the moment was the scale of pensions and disablement allowances for sailors and soldiers and their dependents. Mr. Asquith welcomed a suggestion made by Mr. Law that it should be referred for decision to a small committee of all parties. Mr. Arthur Henderson, who had succeeded the pacifist Mr. Ramsay Macdonald as chairman of the Labour party, promised the full support of organized labour in maintaining unity.

Pensions.

The finance of the war claimed the immediate attention of Parliament. The Prime Minister moved a Vote of Credit for £225,000,000, and a further addition of a million men to the army. On Nov. 17 the Chancellor of the Exchequer explained how it was proposed to raise the money. He had to provide for a deficit of nearly 340 millions. Following the precedents of Pitt in the French War and Gladstone in the Crimean War, a substantial part of this must be obtained by increased taxation levied on all classes. He proposed to double the income-tax (bringing it up to 2s. 6d.), and super-tax, to add the equivalent of a halfpenny a half-pint to the taxation of beer, and to raise the duty on tea from 5d. to 8d. In a full year, he calculated that these increases would bring in over 65 millions. He further announced the immediate issue of a loan of £350,000,000, at 3½%, at 95, which was promptly subscribed. He calculated the cost of the first full year of war as at least £450,000,000. Other important war measures taken at this time were the purchase by Government of £18,000,000 worth of sugar—a foretaste of the coming control of food supplies, not yet expected; a scheme for the manufacture of aniline dyes, hitherto made exclusively in Germany—the consumers to subscribe three millions, and the Government to guarantee debenture interest on another million and a half; the setting up by statute of a custodian of enemy property in the person of the Public Trustee.

First War Budget.

At the end of November the King crossed to France, and spent a week with his army in the field. The visit, which was repeated in subsequent years of war, greatly cheered and sustained the troops. Almost immediately afterwards came the news of Adml. Sturdee's victory off the Falkland Isles. But this was succeeded by evidence that, even though invasion of England in force might be too hazardous to be attempted, the country was exposed to harassing and destructive attacks by sea and air. On the morning of Dec. 16 German warships appeared off Hartlepool, a great business port, and Scarborough and Whitby, two much-frequented watering-places, and bombarded all three towns, doing considerable damage, and killing some 140 people, and wounding many others, mostly civilians, including women and children. The ships only remained for half an hour and then disappeared in the mist, before any portion of the British fleet, save patrol boats, could come up. On Christmas Eve a German aeroplane dropped a bomb in a bed of cabbages near Dover Castle, and at midday on Christmas Day another got up the Thames as far as Erith, but was then chased off. These events produced no panic, but stimulated recruiting, which remained brisk in England, though in Ireland Mr. Redmond's efforts were only moderately successful.

German Attacks by Sea and Air.

Speaking in December, Mr. Bonar Law, while rightfully claiming that the Opposition had distinguished itself from previous war-time oppositions by its patriotic reticence, remarked that perhaps, indeed, they had not criticized the Government enough. The early months of 1915 witnessed a change. It was clear that the war, which in the west had settled down into trench-fighting, would last for a considerable time, even assuming that the "steam-roller" of the Russian advance would eventually cause the German strangle-hold on north-eastern France to relax; it was not so clear that all that the Government had done and left undone was judicious. Criticism therefore awoke, and became steadily more insistent till the formation of the first Coalition Ministry. But it was criticism, not on party lines, directed to the more efficient conduct of the war; the criticism from the pacifist side was negligible. It was urged that voluntary enlistment, though hitherto fairly adequate, could not possibly give the army all the men it would want; that the half-hearted British policy of search and blockade, though it provoked reasoned objections from the American Government, failed to do any serious harm to Germany; that steps should at once be taken to regulate the price of food, which was steadily mounting; that the Press Bureau, under Sir Stanley (afterwards Lord) Buckmaster, was unduly harassing; that quite undue mildness was shown in the treatment accorded to enemy aliens, who should all be interned; that insufficient attention was paid to the development of the air force; and, above all, that the Government had entirely failed to meet the requirements for munitions of war.

Revival of Criticism.

Feeling in England was hardened by the German proclamation of Feb. 4, declaring a blockade of Great Britain from Feb. 18, claiming the right in the war-region to destroy British ships without providing means of escape for passengers and crew, and warning neutral ships that they might incur the same fate. "This," as Mr. Asquith said, "is in effect a claim to torpedo at sight, without regard to the safety of crew and passengers, any merchant vessel under any flag." It was resolved, in consequence, to detain, and take into port, ships carrying goods of presumed enemy destination, ownership or origin; and also to discriminate against submarine prisoners, as having disregarded the laws of war. The sinking of the "Lusitania," in accordance with this proclamation, by the Germans on May 7, with a great loss of life among innocent passengers, largely American, brought the aliens question in England to a head, as it produced violent anti-German riots and demonstrations all over the country. It was decided to intern or deport all enemy aliens, and to scrutinize carefully the cases of naturalized Germans. Widespread indignation had already been aroused this spring by the

"Blockade" of Britain.

Internment of Aliens.

reports of American agents about the treatment meted out to British prisoners in Germany; and this was increased in May by the publication of the report of a committee, presided over by Lord Bryce, confirming the stories of outrage committed by the Germans in Belgium and France. The Prime Minister had no difficulty in obtaining a supplementary Vote of Credit for £37,000,000, and a fresh Vote of Credit for £250,000,000, the cost of the war having already reached two millions a day.

The great difficulty with which the Government had to cope this spring was the insufficient supply of munitions of war, due mainly to strikes, to trade-union practices favouring slow production, and to drink. Appeals were made to the working men by Lord Kitchener; and on March 9 Mr. Lloyd George introduced a new Defence of the Realm bill, giving the Government wide powers of mobilizing industry. On March 17 the Chancellor of the Exchequer met the representatives of 35 trade unions, and pointed out to them that the duration of the war depended on the rate at which munitions could be turned out. Ultimately an agreement was reached under which there was to be in no case any stoppage of work upon munitions and equipments of war; all differences were to be the subject of conference between the parties and in case of disagreement to be referred to arbitration; trade practices were to be relaxed during the war period. In harmony with the spirit of this agreement there was enrolled at Liverpool, under Lord Derby's command, a Dockers' Battalion. With regard to drink Mr. Lloyd George told a deputation of shipowners which advocated total prohibition during the war: "We are fighting Germany, Austria, and drink; and, as far as I can see, the greatest of these three deadly foes is drink." In order to set a good example the King announced that he would give up all alcoholic liquor till after the war, and issued orders against its consumption in the Royal Household. Lord Kitchener, and a considerable number of loyal subjects, followed His Majesty's example. On April 29 Mr. Lloyd George introduced the ministerial proposals which increased enormously the taxation on all alcoholic liquors, and included powers to close and control public-houses in munition areas. But public opinion was not ripe for so stringent a measure, and compelled the withdrawal of these proposals; and the Government contented themselves with setting up a Liquor Control Board with Lord D'Abernon (formerly Sir Edgar Vincent) as chairman, which drastically reduced the alcoholic strength of beer and spirits, in munition or populous areas, and the hours during which public-houses might be open and liquor sold. Only for some two hours in the middle of the day and for some three hours in the evening could drink be procured; and the arrangement worked well.

Strikes.

The Drink Question.

The question of munitions became critical in April and May. The battle of Neuve Chapelle in March had been indecisive owing to a deficiency of ammunition, which was revealed to the people of England by a dispatch from the Military Correspondent of *The Times* (Col. Repington). Mr. Asquith indeed, in a speech at Newcastle-on-Tyne mainly devoted to encouraging munition workers to deliver the goods "more promptly and more effectively," amazed and angered the public by denying that operations in the field had been crippled through lack of ammunition. But Lord Kitchener confessed that "the output is not equal to our needs"; and Mr. Lloyd George dwelt in the House of Commons on the unprecedented expenditure of artillery ammunition and the new importance given to high explosives. The problem, he said, was to produce munitions not only on a much larger scale than ever before but of a different kind. To the anxieties caused by the deficiency of munitions were added those due to the desperate resistance with which the troops, just landed with high hopes on Gallipoli, had been met. Disagreement about the Dardanelles operations between Mr. Churchill, the First Lord of the Admiralty, and Lord Fisher, the First Sea Lord, came to a head; and the Prime Minister, who had on May 12 contradicted the current rumours of coalition, formally told the House a week later that the Government was to be reconstructed "on a broader personal and political basis."

Deficiency of Munitions.

The reconstruction took place during the Whitsuntide recess, it being carefully explained by Mr. Asquith that there was no change of policy and no sacrifice by any minister of his political ideals. The Coalition was "for the purpose of the war alone." Mr. Asquith, Sir Edward Grey and Lord Kitchener retained their respective offices, and Lord Crewe remained Lord President and leader in the Lords; Lord Lansdowne joined the Ministry without portfolio; Mr. Bonar Law became Colonial Secretary; Mr. Balfour took over the Admiralty from Mr. Churchill, who became Chancellor of the Duchy; Mr. Austen Chamberlain went to the India Office; and Lord Curzon, Mr. (afterwards Lord) Long, and Lord Selborne also entered the Cabinet. Mr. Asquith sought the coöperation of both the Irish leaders in his Cabinet; but, while Sir Edward Carson accepted the Attorney-Generalship (having Mr. F. E. Smith as Solicitor-General), Mr. Redmond declined to enter. Mr. Henderson, the leader of the Labour party, became President of the Board of Education. Public opinion would not tolerate the retention of Lord Haldane, with his German associations, as Lord Chancellor. The post was declined by the Attorney-General, Sir John Simon, and he became Home Secretary. The Solicitor-General, Sir Stanley Buckmaster, was accordingly promoted to the woolsack as Lord Buckmaster. The vital importance of guns and ammunition was recognized by the creation of a new Ministry of Munitions, at the head of which was placed the most energetic member of the late Ministry, already rivalling Mr. Asquith in reputation, Mr. Lloyd George. Mr. McKenna succeeded to the Chancellorship of the Exchequer, and Mr. Runciman, Mr. Birrell, Mr. McKinnon Wood and Mr. Harcourt remained in the Cabinet. The Liberal ministers who retired, besides Lord Haldane, were Lord Beauchamp, Mr. Hobhouse, Mr. Pease, Lord Lucas and Lord Emmott; Mr. Herbert Samuel became Postmaster-General, but was excluded from the Cabinet; and Mr. Montagu became Financial Secretary to the Treasury, Lord Robert Cecil Under-Secretary for Foreign Affairs and the Duke of Devonshire Civil Lord of the Admiralty; Mr. Brace, the Labour member, was appointed Under-Secretary for Home Affairs.

First Coalition Ministry.

The country, which was cheered this May by the entry of Italy into the war on the side of the Allies, welcomed the new Ministry as giving promise of a more strenuous conduct of hostilities. Mr. Lloyd George threw himself with ardour into his new work, enlisted the aid of business and practical men and men of science in its organization, and made a personal appeal to the great towns, Manchester, Liverpool and Cardiff, to concentrate on enlarging the output, and to consent to the modification of such trade-union rules as conflicted with rapid and efficient production. It was in the workshops of the country, he said, that success must be sought. He urged the conversion of workshops engaged in the arts of peace into factories for turning out munitions of war. Mr. Lloyd George got at once to work on the lines he had laid down. He brought in on June 23 a Munitions of War bill, embodying his plans for increasing output. They were based on a system of decentralization. There were to be 10 munition areas, managed by local business men. There must be no strikes or lockouts; disputes must be referred to arbitration. Skilled men must be brought back from the army; Munition Courts appointed, representative of Government, employers and workmen; trade-union regulations restricting output must be suspended; and employers' profits limited. These proposals, with some modifications, were accepted by the Labour leaders; and the bill promptly became law.

Mr. Lloyd George as Minister of Munitions.

But the Act by no means put a complete stop to labour troubles. In July the South Wales miners suddenly demanded a new minimum rate of wages higher than the previous maximum. Mr. Runciman, President of the Board of Trade, in vain endeavoured to compose the quarrel. The Government applied the provisions of the Munitions Act with no result, and a card vote gave a majority for a strike. Mr. Lloyd George went down to Cardiff and effected a settlement by an advance on

Strike of South Wales Miners.

country in his speech at the Guildhall on Lord Mayor's Day. Britain, he said, would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed.

War Conditions.

Meanwhile England was feeling day by day more and more what it meant to be at war. On the coasts, and especially the east coast, houses were destroyed which might either obstruct the British line of fire or serve as landmarks for a hostile fleet; lamps were extinguished on the sea front and all streets leading to it; no lights were allowed to be shown from private houses; and lighthouses and lightships were temporarily extinguished. The development of air warfare shortly caused the streets of London and all towns accessible from the east to be darkened, and searchlights, special guns, and an increasing number of air machines to be held in readiness against attack; while all trains in the south-eastern quarter of England had to have their blinds drawn after nightfall. The fall of Antwerp and the loss of the Belgian coast to the enemy brought the imminence of the danger home. These events in Belgium brought also a great accession to the number of Belgian refugees who had already sought shelter in England, and a vast organization of public and private benevolence catered for their needs. On the other hand, public opinion in England was cheered about this time by the arrival of the first contingent of Canadian troops, the forerunner of a mighty force from all the Dominions; and by the appearance in the battle line in France of native troops from India. This was unfortunately succeeded by the news of the defeat of Adml. Cradock at Coronel.

Pensions.

The new parliamentary session, which opened on Nov. 11, followed immediately upon a serious development of the conflict—the entry of Turkey into the war as an ally of the Central Powers (which had as one result the proclamation of Egypt as a British Protectorate). The King, in his Speech, said that "the only measures which will be submitted to you, at this stage of the session, are such as seem necessary to my advisers for the attainment of the great purpose upon which the efforts of the Empire are set." The most burning question of the moment was the scale of pensions and disablement allowances for sailors and soldiers and their dependents. Mr. Asquith welcomed a suggestion made by Mr. Law that it should be referred for decision to a small committee of all parties. Mr. Arthur Henderson, who had succeeded the pacifist Mr. Ramsay Macdonald as chairman of the Labour party, promised the full support of organized labour in maintaining unity.

First War Budget.

The finance of the war claimed the immediate attention of Parliament. The Prime Minister moved a Vote of Credit for £225,000,000, and a further addition of a million men to the army. On Nov. 17 the Chancellor of the Exchequer explained how it was proposed to raise the money. He had to provide for a deficit of nearly 340 millions. Following the precedents of Pitt in the French War and Gladstone in the Crimean War, a substantial part of this must be obtained by increased taxation levied on all classes. He proposed to double the income-tax (bringing it up to 2s. 6d.), and super-tax, to add the equivalent of a halfpenny a half-pint to the taxation of beer, and to raise the duty on tea from 5d. to 8d. In a full year, he calculated that these increases would bring in over 65 millions. He further announced the immediate issue of a loan of £350,000,000, at $3\frac{1}{2}$%, at 95, which was promptly subscribed. He calculated the cost of the first full year of war as at least £450,000,000. Other important war measures taken at this time were the purchase by Government of £18,000,000 worth of sugar—a foretaste of the coming control of food supplies, not yet expected; a scheme for the manufacture of aniline dyes, hitherto made exclusively in Germany—the consumers to subscribe three millions, and the Government to guarantee debenture interest on another million and a half; the setting up by statute of a custodian of enemy property in the person of the Public Trustee.

German Attacks by Sea and Air.

At the end of November the King crossed to France, and spent a week with his army in the field. The visit, which was repeated in subsequent years of war, greatly cheered and sustained the troops. Almost immediately afterwards came the news of Adml. Sturdee's victory off the Falkland Isles. But this was succeeded by evidence that, even though invasion of England in force might be too hazardous to be attempted, the country was exposed to harassing and destructive attacks by sea and air. On the morning of Dec. 16 German warships appeared off Hartlepool, a great business port, and Scarborough and Whitby, two much-frequented watering-places, and bombarded all three towns, doing considerable damage, and killing some 140 people, and wounding many others, mostly civilians, including women and children. The ships only remained for half an hour and then disappeared in the mist, before any portion of the British fleet, save patrol boats, could come up. On Christmas Eve a German aeroplane dropped a bomb in a bed of cabbages near Dover Castle, and at midday on Christmas Day another got up the Thames as far as Erith, but was then chased off. These events produced no panic, but stimulated recruiting, which remained brisk in England, though in Ireland Mr. Redmond's efforts were only moderately successful.

Revival of Criticism.

Speaking in December, Mr. Bonar Law, while rightfully claiming that the Opposition had distinguished itself from previous war-time oppositions by its patriotic reticence, remarked that perhaps, indeed, they had not criticized the Government enough. The early months of 1915 witnessed a change. It was clear that the war, which in the west had settled down into trench-fighting, would last for a considerable time, even assuming that the "steam-roller" of the Russian advance would eventually cause the German strangle-hold on north-eastern France to relax; it was not so clear that all that the Government had done and left undone was judicious. Criticism therefore awoke, and became steadily more insistent till the formation of the first Coalition Ministry. But it was criticism, not on party lines, directed to the more efficient conduct of the war; the criticism from the pacifist side was negligible. It was urged that voluntary enlistment, though hitherto fairly adequate, could not possibly give the army all the men it would want; that the half-hearted British policy of search and blockade, though it provoked reasoned objections from the American Government, failed to do any serious harm to Germany; that steps should at once be taken to regulate the price of food, which was steadily mounting; that the Press Bureau, under Sir Stanley (afterwards Lord) Buckmaster, was unduly harassing; that quite undue mildness was shown in the treatment accorded to enemy aliens, who should all be interned; that insufficient attention was paid to the development of the air force; and, above all, that the Government had entirely failed to meet the requirements for munitions of war.

"Blockade" of Britain.

Feeling in England was hardened by the German proclamation of Feb. 4, declaring a blockade of Great Britain from Feb. 18, claiming the right in the war-region to destroy British ships without providing means of escape for passengers and crew, and warning neutral ships that they might incur the same fate. "This," as Mr. Asquith said, "is in effect a claim to torpedo at sight, without regard to the safety of crew and passengers, any merchant vessel under any flag." It was resolved, in consequence, to detain, and take into port, ships carrying goods of presumed enemy destination, ownership or origin; and also to discriminate against submarine prisoners, as having disregarded the laws of war. The sinking of the "Lusitania," in accordance with this proclamation, by the Germans on May 7, with a great loss of life among innocent passengers, largely American, brought the aliens question in England to a head, as it produced violent anti-German riots and demonstrations all over the country. It was decided to intern or deport all enemy aliens, and to scrutinize carefully the cases of naturalized Germans. Widespread indignation had already been aroused this spring by the

Internment of Aliens.

The secrecy enforced upon the press produced many protests, until the Press Bureau was placed under the competent headship of an able journalist, Sir Edward Cook, and a leading ex-colonial administrator, Sir Frank Swettenham. One urgent matter dealt with by Parliament (which sat continuously, with short intervals of prorogation or adjournment, throughout the war) was the question of its own existence, which under the Parliament Act should terminate in December of this year, but which was prolonged by statute this autumn, and by subsequent statutes in subsequent years, till after the conclusion of the war. Further powers were given to the Munitions Ministry by a bill passed in December; and Mr. Lloyd George, while claiming that the output of munitions had been prodigiously increased, urged the imperative need of further efforts, especially by the method of "diluting" skilled labour by the introduction of women. The footsteps of the Allies, he warned Parliament, had been dogged by the spectre of "Too late."

Prolongation of Parliament.

One vitally important matter, the finance of the war, was resolutely grappled with this autumn by the Coalition Government, and by Mr. McKenna, its Chancellor of the Exchequer. The cost of hostilities was rapidly mounting. In moving a Vote of Credit in Sept. for £250,000,000, the Prime Minister said that it had risen in the past half year from £2,700,000 to over £3,500,000 a day; in moving a similar Vote for £400,000,000 in November, he estimated for an expenditure of £5,000,000 a day. In these circumstances a strenuous effort was made in the third war budget in September to raise a large portion of the outlay by taxation. In the previous year Mr. Lloyd George had doubled the income-tax and super-tax, and greatly increased the taxes on beer and tea. Beer, which was now severely limited by the Board of Control, Mr. McKenna left alone. But he increased the income-tax once more by 40%, and reduced the exemption limit, while permitting payment in half-yearly instalments. Super-tax was also increased. He imposed a new excess-profits tax—to tap the lucrative gains of war manufacture—of 50 per cent. He increased the taxation on sugar enormously; added 50% more in duties on tea, tobacco, cocoa, coffee, chicory and dried fruits; raised the duty on motor spirits by 3d. a gallon, and doubled the patent-medicine duty. He abolished the halfpenny post, increased the 6d. telegram to 9d., and made the press telegraph charges self-supporting. He undertook an entirely new departure by taxing foreign luxuries, putting a $33\frac{1}{3}$% *ad valorem* duty on imported motor-cars and cycles, cinema films, clocks, watches, musical instruments, plate-glass and hats. These new taxes were estimated to bring in £107,000,000; but he placed the expenditure at £1,590,000,000, and the revenue, on the basis of existing taxation, at £272,110,000, so that there was a wide margin still to be filled by borrowing. There was some attempt to raise in debate the issue of Free Trade and Protection; but with the exception of the plate-glass and hat taxes, which were abandoned, the budget had an easy passage through Parliament.

Mr. McKenna's First Budget.

When the year 1916 opened there was a general agreement that the war had become to an enormous extent a war of attrition, and the Cabinet therefore proceeded at once to bring in the Compulsory Service bill, to which circumstances had, however reluctantly, driven them. It was far from being universal. It merely treated unattested single men and childless widowers between the ages of 18 and 40 as if they had attested under Lord Derby's group system. Ireland was excluded from the bill, and exemptions were allowed for ministers of religion, men medically rejected or physically unfit, those employed in necessary national work, those who were the sole support of dependents, and "conscientious objectors" to combatant service. Tribunals were set up to deal with claims for exemption. Sir John Simon led a small and dwindling opposition; but many of the Labour members, including Mr. Henderson, the leader of the party, supported the bill; Mr. Redmond, who led 60 Nationalists into the lobby against the first reading, withdrew Nationalist opposition on perceiving the united demand in Great Britain in its favour; and the second reading was carried by 431 votes against 39. No hostile amendment received any serious support in committee, and the bill was read a third time by 383 votes against 36. In the Lords the measure was passed without a division, Lord Derby explaining that there were at least 650,000 unattested single men who would be affected by it. There was some fear that the labour organizations, who suspected the possibility of industrial conscription, would place serious difficulties in the way of enforcing its provisions. They did indeed condemn it by a considerable majority at a labour conference held while it was passing through Parliament; but they decided not to agitate against it. Little practical effect was given to their condemnation save in the Clyde district, where in March and April strikes were organized in munition works with a view to getting this Act, and the Munitions Act facilitating dilution of labour, repealed. The ringleaders, however, were arrested and deported.

Military Service Bill.

The local tribunals, which were set up, proved to be, on the whole, generous in continuing the exemptions; and there was in consequence strong criticism, in the press and in Parliament, both on behalf of the married men, who considered that the pledges of comparative immunity made to them were imperilled, and on behalf of those who were eager for the efficient conduct of the war, and who held that the purpose of the Act was being defeated. There had been organized in the House of Commons, in each of the two great parties which supported the Coalition, a War Committee, having for its sole concern the strenuous prosecution of the war. On March 21 the Liberal War Committee passed a resolution approving the extension of the principle of compulsion to married men; and powerful organs of the press, notably *The Times* and other journals of which Lord Northcliffe was the principal proprietor, proclaimed that the needs of the army could not be properly supplied without universal compulsion. On March 28 the Unionist War Committee resolved that there ought to be equal sacrifices from all men of military age; and Sir Edward Carson, a leading spirit in that Committee, urged the Government to extend compulsion universally, criticizing their hesitations. Lord Derby was also very critical in the House of Lords, and Lord Milner in that House implored the Government to put recruiting on the only satisfactory basis. The soldiers also pressed ministers hard. But a Cabinet Committee, consisting of Mr. Asquith, Mr. McKenna, Lord Lansdowne, and Mr. Austen Chamberlain came unanimously on April 14 to an adverse decision. The Cabinet did not accept their Committee's alternative scheme, but could not reach a decision. Not for the first time the Prime Minister had to ask the House of Commons for leave to postpone his official statement on the subject, telling the House that there were still points unsettled, and that the break-up of the Cabinet would be a national disaster of the most formidable kind. At length it was announced that a satisfactory decision had been reached; and on April 25, after the Easter holidays, in secret session in both Houses (the first of seven such sessions held during the war), ministers explained their proposals, which, it was found, only involved universal compulsion in case a number of other expedients which it is unnecessary to enumerate should fail to provide sufficient men. When the bill embodying the proposals was introduced by Mr. Long two days later, neither conscriptionists nor anti-conscriptionists found anything to say in its favour. It was withdrawn at once, and five days later Mr. Asquith announced that the Government had accepted universal compulsory service. The bill, which was introduced on May 3, brought within its operation every male between the ages of 18 and 41, and recalled time-expired men under 41 to the army. The exemptions remained as before, and Ireland was not included. In spite of Sir J. Simon's opposition, the bill passed easily through both Houses, though the method of dealing with conscientious objectors was felt to be a serious difficulty. The final step had been taken at last; but the Government had lost much of its prestige owing to the "wait and see" attitude which it had adopted.

Demand for Wider Measures.

Ministerial Indecision.

Universal Military Service Bill.

country in his speech at the Guildhall on Lord Mayor's Day. Britain, he said, would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed.

Meanwhile England was feeling day by day more and more what it meant to be at war. On the coasts, and especially the east coast, houses were destroyed which might either obstruct the British line of fire or serve as landmarks for a hostile fleet; lamps were extinguished on the sea front and all streets leading to it; no lights were allowed to be shown from private houses; and lighthouses and lightships were temporarily extinguished. The development of air warfare shortly caused the streets of London and all towns accessible from the east to be darkened, and searchlights, special guns, and an increasing number of air machines to be held in readiness against attack; while all trains in the south-eastern quarter of England had to have their blinds drawn after nightfall. The fall of Antwerp and the loss of the Belgian coast to the enemy brought the imminence of the danger home. These events in Belgium brought also a great accession to the number of Belgian refugees who had already sought shelter in England, and a vast organization of public and private benevolence catered for their needs. On the other hand, public opinion in England was cheered about this time by the arrival of the first contingent of Canadian troops, the forerunner of a mighty force from all the Dominions; and by the appearance in the battle line in France of native troops from India. This was unfortunately succeeded by the news of the defeat of Adml. Cradock at Coronel.

War Conditions.

The new parliamentary session, which opened on Nov. 11, followed immediately upon a serious development of the conflict—the entry of Turkey into the war as an ally of the Central Powers (which had as one result the proclamation of Egypt as a British Protectorate). The King, in his Speech, said that "the only measures which will be submitted to you, at this stage of the session, are such as seem necessary to my advisers for the attainment of the great purpose upon which the efforts of the Empire are set." The most burning question of the moment was the scale of pensions and disablement allowances for sailors and soldiers and their dependents. Mr. Asquith welcomed a suggestion made by Mr. Law that it should be referred for decision to a small committee of all parties. Mr. Arthur Henderson, who had succeeded the pacifist Mr. Ramsay Macdonald as chairman of the Labour party, promised the full support of organized labour in maintaining unity.

Pensions.

The finance of the war claimed the immediate attention of Parliament. The Prime Minister moved a Vote of Credit for £225,000,000, and a further addition of a million men to the army. On Nov. 17 the Chancellor of the Exchequer explained how it was proposed to raise the money. He had to provide for a deficit of nearly 340 millions. Following the precedents of Pitt in the French War and Gladstone in the Crimean War, a substantial part of this must be obtained by increased taxation levied on all classes. He proposed to double the income-tax (bringing it up to 2s. 6d.), and super-tax, to add the equivalent of a halfpenny a half-pint to the taxation of beer, and to raise the duty on tea from 5d. to 8d. In a full year, he calculated that these increases would bring in over 65 millions. He further announced the immediate issue of a loan of £350,000,000, at 3½%, at 95, which was promptly subscribed. He calculated the cost of the first full year of war as at least £450,000,000. Other important war measures taken at this time were the purchase by Government of £18,000,000 worth of sugar—a foretaste of the coming control of food supplies, not yet expected; a scheme for the manufacture of aniline dyes, hitherto made exclusively in Germany—the consumers to subscribe three millions, and the Government to guarantee debenture interest on another million and a half; the setting up by statute of a custodian of enemy property in the person of the Public Trustee.

First War Budget.

At the end of November the King crossed to France, and spent a week with his army in the field. The visit, which was repeated in subsequent years of war, greatly cheered and sustained the troops. Almost immediately afterwards came the news of Adml. Sturdee's victory off the Falkland Isles. But this was succeeded by evidence that, even though invasion of England in force might be too hazardous to be attempted, the country was exposed to harassing and destructive attacks by sea and air. On the morning of Dec. 16 German warships appeared off Hartlepool, a great business port, and Scarborough and Whitby, two much-frequented watering-places, and bombarded all three towns, doing considerable damage, and killing some 140 people, and wounding many others, mostly civilians, including women and children. The ships only remained for half an hour and then disappeared in the mist, before any portion of the British fleet, save patrol boats, could come up. On Christmas Eve a German aeroplane dropped a bomb in a bed of cabbages near Dover Castle, and at midday on Christmas Day another got up the Thames as far as Erith, but was then chased off. These events produced no panic, but stimulated recruiting, which remained brisk in England, though in Ireland Mr. Redmond's efforts were only moderately successful.

German Attacks by Sea and Air.

Speaking in December, Mr. Bonar Law, while rightfully claiming that the Opposition had distinguished itself from previous war-time oppositions by its patriotic reticence, remarked that perhaps, indeed, they had not criticized the Government enough. The early months of 1915 witnessed a change. It was clear that the war, which in the west had settled down into trench-fighting, would last for a considerable time, even assuming that the "steam-roller" of the Russian advance would eventually cause the German strangle-hold on north-eastern France to relax; it was not so clear that all that the Government had done and left undone was judicious. Criticism therefore awoke, and became steadily more insistent till the formation of the first Coalition Ministry. But it was criticism, not on party lines, directed to the more efficient conduct of the war; the criticism from the pacifist side was negligible. It was urged that voluntary enlistment, though hitherto fairly adequate, could not possibly give the army all the men it would want; that the half-hearted British policy of search and blockade, though it provoked reasoned objections from the American Government, failed to do any serious harm to Germany; that steps should at once be taken to regulate the price of food, which was steadily mounting; that the Press Bureau, under Sir Stanley (afterwards Lord) Buckmaster, was unduly harassing; that quite undue mildness was shown in the treatment accorded to enemy aliens, who should all be interned; that insufficient attention was paid to the development of the air force; and, above all, that the Government had entirely failed to meet the requirements for munitions of war.

Revival of Criticism.

Feeling in England was hardened by the German proclamation of Feb. 4, declaring a blockade of Great Britain from Feb. 18, claiming the right in the war-region to destroy British ships without providing means of escape for passengers and crew, and warning neutral ships that they might incur the same fate. "This," as Mr. Asquith said, "is in effect a claim to torpedo at sight, without regard to the safety of crew and passengers, any merchant vessel under any flag." It was resolved, in consequence, to detain, and take into port, ships carrying goods of presumed enemy destination, ownership or origin; and also to discriminate against submarine prisoners, as having disregarded the laws of war. The sinking of the "Lusitania," in accordance with this proclamation, by the Germans on May 7, with a great loss of life among innocent passengers, largely American, brought the aliens question in England to a head, as it produced violent anti-German riots and demonstrations all over the country. It was decided to intern or deport all enemy aliens, and to scrutinize carefully the cases of naturalized Germans. Widespread indignation had already been aroused this spring by the

budget introduced on April 4, estimated the net revenue at £502,-000,000 and the expenditure at £1,825,000,000; so that there was a deficit of £1,323,000,000, to be met by borrowing, which would mean a new charge, for interest at 5% and sinking fund at 1%, of £70,000,000. He tackled this unflinchingly; raised income tax to a maximum of 5s. in the pound, thus gaining £43,500,000; increased the excess profits tax from 50 to 60%; imposed an amusement tax on tickets for all public shows and a railway ticket tax on all journeys costing more than 9d.; he also took toll of matches, table-waters, cider and perry. Then he increased very seriously the duties on motor-cars, motorcycles, sugar, cocoa, coffee and chicory. Colossal as the budget was, involving £300,000,000 of new taxation since the war began, it passed through Parliament substantially unchanged.

Mr. Asquith took advantage of Mr. Hughes's presence this spring to repeat an experiment which he had successfully made in the previous year when Sir Robert Borden, the Canadian Prime Minister, was in England; namely to invite the visiting Dominion minister to sit in Cabinet, and share in the imperial decisions on the war. He also continued his efforts to draw the Allies into closer coöperation by attending a war conference in Paris on March 27, and then proceeding to Italy to consolidate relations with the new Ally.

Cabinet and Dominion Premiers.

Shortly after his return, he had to deal with a sudden outbreak of rebellion at Easter in Ireland, principally in Dublin. The rebellion was put down by military force under Sir John Maxwell; the ringleaders were tried by court-martial and shot; Casement, who had landed from Germany, was put on his trial for treason and hanged; the Chief Secretary, Mr. Birrell, and the Lord Lieutenant resigned; a commission was appointed to inquire into the causes of the insurrection (and, it may be added, reported that it was mainly attributable to weakness in administration); and in the middle of May Mr. Asquith went himself to Dublin with a view to arriving at some new arrangement for the future government of Ireland. On his return he told the House of Commons that he had been deeply impressed by the breakdown of the existing machinery, and by the universality of the Irish feeling that there was now a unique opportunity for a new departure. Accordingly he announced that ministers had unanimously commissioned their colleague, Mr. Lloyd George, to endeavour to effect a settlement. The announcement was favourably received, as Mr. Lloyd George's good-will to Ireland was well known, and his reputation for getting work done had enormously increased since the outbreak of war. It was believed, moreover, that a Coalition would have a better chance than a party Government to arrange agreed terms. At first the negotiations appeared to promise well. Mr. Redmond told a meeting of the Irish Parliamentary party in Dublin on June 10 that Mr. Lloyd George's proposals were:—(1) to bring the Home Rule Act into immediate operation; (2) to introduce at once an Amending bill, to cover only the period of the war and a short interval after it, providing during this period for the retention of the Irish members at Westminster in full number, and of the six Ulster counties under the imperial Government. Sir Edward Carson persuaded the Unionist Ulstermen to accept these terms, and Mr. Devlin obtained a vote in their support from the Nationalists of the six counties. But the growing body of Sinn Feiners regarded the negotiations with great disfavour; and, on the other hand, the Southern Unionists protested, and many Unionists in Parliament and the Cabinet objected, Lord Selborne resigning his office in consequence. Lord Lansdowne explained that the Government were not bound by Mr. Lloyd George's consultations, and certain modifications were introduced in order to meet Unionist objections. The main alteration was that the Government could not agree to retain the Irish members at Westminster in undiminished numbers after the next election. The Government also proposed during the transition to appoint an Irish minister responsible to Parliament, having a military officer associated with him with forces sufficient to maintain order. These modifications were the reason, or the excuse, for Mr. Redmond to raise the cries of "coercion" and "breach of faith," and to withdraw from the negotiation; though Mr. Lloyd George, the Government negotiator, protested that in his opinion the terms were such as the Irish members might well accept. The negotiations having broken down, Mr. Duke, a Unionist, was appointed Chief Secretary, and a month later, Lord Wimborne, a Liberal, was reappointed Lord Lieutenant.

Rebellion in Ireland.

Mr. Lloyd George's Irish Negotiations.

The summer of 1916 was marked by the sudden death of the great soldier upon whose experience and power of organization the majority of Britons at the outset of war placed their special reliance. Lord Kitchener, on a mission to Russia, left the north of Scotland on June 5 in H.M.S. "Hampshire," which that evening struck a mine to the east of the Orkneys and sank. There were only 12 survivors, and he was not among them. His services, in the early days of war, were of incalculable value. If, subsequently, he had failed in some degree to adapt himself to his environment, nevertheless his disappearance was felt all over the world as a heavy blow to the Allied cause. Its effect was minimized, so far as might be, by the appointment to the Secretaryship of State in his place of the civilian minister who had shown the greatest energy and resource in the war, Mr. Lloyd George. Lord Derby, who had rendered exemplary services to recruiting, became Under-Secretary for War. At the same time, Sir Edward Grey, the trusted Foreign Secretary, whose eyesight had been failing, went to the House of Lords as Visct. Grey of Fallodon. He retained the Foreign Secretaryship, and had an efficient representative in the House of Commons in Lord Robert Cecil, at once his Under-Secretary and Minister of Blockade.

Death of Lord Kitchener.

Public opinion in England was disturbed this summer over many subsidiary matters relating to the war—the ill-treatment of British civilian prisoners at Ruhleben, and of British military prisoners in German camps, and the slight attention which the German Government paid to the reports of American diplomatic visitors and to British diplomatic representations; the increasing shortness of food, the difficulties of agriculturists whose labourers had been taken under the Military Service Acts and who had not been able as yet to obtain an adequate supply of capable women in their place, and the nearing prospect of rations; the judicial murder by the Germans of Capt. Fryatt, of the s.s. "Brussels," for endeavouring to ram a German submarine; and—what loomed largest in Parliamentary debate—the failure of British arms in two exclusively British theatres of action, the Dardanelles and Mesopotamia. The remaining troops had all been brought safely away from the Gallipoli peninsula in the winter of 1915–6, but the causes of the failure of a promising venture were still hotly disputed; in Mesopotamia, Gen. Townshend had been forced to retire before reaching Bagdad, had been besieged in Kut, and had finally, on April 29, been driven to surrender with all his force to the Turks. The Government resisted inquiry until public opinion proved too strong for them; but at the end of July two Royal Commissions were appointed; that for Mesopotamia under the chairmanship of Lord George Hamilton, a former Secretary of State for India; that for the Dardanelles under the chairmanship of Lord Cromer, the most venerated of British empire-builders.

Dardanelles and Mesopotamia Commissions.

Stirring events happened this spring and summer in the war nearer home. The German fleet ventured out into the North Sea, and, after being held and fought for several hours by Sir David Beatty and his battle-cruiser squadron, was brought to action by Sir John Jellicoe and the main fleet off the coast of Jutland, was severely handled, and only got back to harbour under cover of night. But British losses were serious, and many doubted whether the most had been made of a unique opportunity. Then the determined German attempt to take Verdun was resisted most heroically by the French in a fight lasting many weeks; and on July 1 the British army, partly with the view of relieving the pressure on its Allies, began a furious assault on the Somme, which, though successful

Battle of Jutland.

country in his speech at the Guildhall on Lord Mayor's Day. Britain, he said, would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed.

Meanwhile England was feeling day by day more and more what it meant to be at war. On the coasts, and especially the east coast, houses were destroyed which might either obstruct the British line of fire or serve as landmarks for a hostile fleet; lamps were extinguished on the sea front and all streets leading to it; no lights were allowed to be shown from private houses; and lighthouses and lightships were temporarily extinguished. The development of air warfare shortly caused the streets of London and all towns accessible from the east to be darkened, and searchlights, special guns, and an increasing number of air machines to be held in readiness against attack; while all trains in the south-eastern quarter of England had to have their blinds drawn after nightfall. It was resolved, in consequence, to detain, and take into port, ships carrying goods of presumed enemy destination, ownership or origin; and also to discriminate against submarine prisoners, as having disregarded the laws of war. The sinking of the "Lusitania," in accordance with this proclamation, by the Germans on May 7, with a great loss of life among innocent passengers, largely American, brought the aliens question in England to a head, as it produced violent anti-German riots and demonstrations all over the country. It was decided to intern or deport all enemy aliens, and to scrutinize carefully the cases of naturalized Germans. Widespread indignation had already been aroused this spring by the

coöperation, and also considered that Mr. Lloyd George had shown the qualities which the nation wanted at this critical period. So the commission passed to Mr. Lloyd George, the statesman whose reputation had steadily grown throughout the world conflict, who had already played such a decisive part, as Chancellor of the Exchequer, Minister of Munitions, and Secretary of State for War, and who more than any of his colleagues embodied the will to victory of his countrymen.

Mr. Lloyd George, Prime Minister.

Mr. Lloyd George was assured of the close coöperation of Mr. Bonar Law, and of the united support of the Unionist party. He set great store upon the help of the Labour party, one of whose members, in his view, ought to sit on the small Committee or Council directing the conduct of the war. Meetings of the Parliamentary Labour party and the National Executive were held, at which, on the advice of all the labour members who had been ministers in the First Coalition and of the chairman of the party, it was decided by a majority to take part in the new Government—a decision which was ratified by the annual Labour Party Conference in the following month. The action of the Liberal party was thought at first to be doubtful, because Mr. Asquith, and all his principal Liberal Cabinet colleagues, such as Lord Grey of Fallodon, Lord Crewe and Mr. McKenna, refused to serve under Mr. Lloyd George. But the Liberal War Committee pledged itself at once to active support; the Welsh Liberal members rallied in a body to the side of the Welsh Prime Minister; and a party meeting at the Reform Club, following the advice of Mr. Asquith, recorded its determination to give support to the King's Government engaged in the effective prosecution of the war. Mr. Lloyd George and Mr. Bonar Law, therefore, had a wide field of selection, only Mr. Asquith and his immediate friends, and Lord Lansdowne, who took the occasion to retire, being ruled out.

Labour's Place in the Coalition.

Having a free hand Mr. Lloyd George carried through an even more revolutionary change than that which he had submitted to Mr. Asquith. He constituted a small Cabinet of four members, who were relieved entirely of serious departmental duties, who were to sit daily, and to concentrate themselves upon the war, of the conduct of which they were to have absolute control. He himself, as Prime Minister, was the chairman of this War Cabinet; and, in order to perform this his main duty satisfactorily, he devolved the leadership of the House of Commons upon Mr. Bonar Law, who was indeed already the leader of the largest numerical section of its members. Mr. Law also became Chancellor of the Exchequer, and was an additional member of the War Cabinet, but was not expected to attend regularly. The Prime Minister's three regular Cabinet colleagues were Lord Curzon, who became Lord President of the Council and leader of the House of Lords, and two ministers without portfolio, Mr. Henderson, the Labour leader who had held high office in the first Coalition, and Lord Milner, the only statesman of marked administrative ability and experience who had not joined that Coalition. It was right to turn, at this critical moment, to the man who had borne the civil responsibility in the last British war, that with the Boers; and from this time onward Lord Milner's share in the conduct of the war from the British side was second only to Mr. Lloyd George's. The War Cabinet sat daily in Whitehall Gardens, having Sir Maurice Hankey, the secretary of the Committee of Imperial Defence, as its secretary, with a competent staff under him. Other ministers were summoned to its deliberations, whenever these concerned the departments for which they were responsible.

War Cabinet.

The one serious loss which Great Britain suffered through Mr. Asquith's resignation was that of the Foreign Secretary, Lord Grey of Fallodon, who had conducted the external affairs of the country, with increasing reputation and success, for 11 years. It was vitally important for Mr. Lloyd George to secure, as Lord Grey's successor, a statesman in whose character and record the Allies could have full confidence. He was fortunate in obtaining Mr. Balfour's consent to accept an office with whose work he had become familiar when acting Secretary of State in Lord Salisbury's absence. For the other important posts in his Ministry Mr. Lloyd George relied very largely upon the services of business men and experts, hitherto in many cases outside politics and the Houses of Parliament, of whose aid he had made such excellent use in developing munitions. The country saw with satisfaction the Board of Trade entrusted to Sir Albert Stanley, who had previously directed the Underground railway and the motor-omnibus system; the Board of Education to Mr. H. A. L. Fisher, the Oxford scholar and historian, vice-chancellor of the university of Sheffield; the Local Government Board to Lord Rhondda, the South Wales colliery magnate; and the Board of Agriculture to Mr. R. E. Prothero (afterwards Lord Ernle), M.P. for Oxford University, who had managed for many years the vast agricultural estates of the Duke of Bedford. For the more efficient conduct of the war, five new ministries were created—Air, Labour, Pensions, Food Control, and Shipping Control—for two of which, Pensions and Food Control, some inchoate provision had been made in the last weeks of the first Coalition Ministry. Lord Devonport, who had large experience in the grocery business, became Food Controller; Sir Joseph Maclay, a Glasgow ship-owner, was appointed Shipping Controller; the new Air Board was constituted with Lord Cowdray, the head of a great firm of contractors, as president; while Labour and Pensions were fittingly assigned to two outstanding Labour members, Mr. Hodge and Mr. George Barnes. Seats were found in the House of Commons for Sir Albert Stanley and Mr. Fisher; but Sir Joseph Maclay preferred to work outside Parliament, and his office was represented in the House by Sir Leo Chiozza Money, the parliamentary secretary. Where Mr. Lloyd George appointed experienced parliamentarians to office, he chose those who had shown special keenness in the prosecution of the war. Then Sir Edward Carson went to the Admiralty; Lord Derby to the War Office; Mr. Walter Long to the Colonial Office; Dr. Addison to the Ministry of Munitions; and Sir Frederick Cawley, chairman of the Liberal War Committee, to the Duchy of Lancaster. Mr. Chamberlain remained Indian Secretary, Lord Robert Cecil Minister of Blockade, Mr. Duke Irish Secretary and Sir F. E. Smith Attorney-General, Sir Gordon Hewart becoming Solicitor-General in the place of Sir George Cave, who went to the Home Office. Sir Robert Finlay, who had been Attorney-General in 1900–6, was made Lord Chancellor as Lord Finlay. There were joint parliamentary secretaries to the Treasury, Lord Edmund Talbot (afterwards Lord Fitzalan), and Hon. Neil Primrose, Lord Rosebery's son.

Ministers Outside War Cabinet.

In addition to these appointments, Mr. Lloyd George announced, in his statement on Dec. 19 of the policy of the new Government, that the time had come for complete mobilization of the labour reserves, and therefore the Cabinet had adopted the principle of universal national service, and had appointed Mr. Neville Chamberlain, Lord Mayor of Birmingham, Director-General of National Service. He would schedule all industries, and set labour free from non-essential industries, so as to be available for war and for essential industries. The new Prime Minister also announced that the Government would take complete control of all ships and of the whole mining industry. There must also, he said, be real sacrifices made in the matter of food. Every available square yard must be made to produce; and as to luxuries and indulgences there must be a national Lent. These exhortations were supplemented by Mr. Prothero, the Minister for Agriculture, who said that the War Office and the country must realize that Britain was as a beleaguered city, and that victory might well be lost or won on her corn fields and potato lands; and by Lord Devonport, the Food Controller, who pushed further the restrictions which Mr. Runciman had already enforced, limited dinners to three courses and luncheons to two courses in all public eating places, and hinted at rationing as the only way of ensuring that unpatriotic people did not get supplies in excess of their wants. In another direction the Government developed boldly a policy tentatively adopted by their predecessors. The Colonial Secretary summoned immediately by cable the Prime Ministers of the self-governing dominions to a special war conference of the

Statements of Policy.

country in his speech at the Guildhall on Lord Mayor's Day. Britain, he said, would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed.

Meanwhile England was feeling day by day more and more what it meant to be at war. On the coasts, and especially the east coast, houses were destroyed which might either obstruct the British line of fire or serve as landmarks for a hostile fleet; lamps were extinguished on the sea front and all streets leading to it; no lights were allowed to be shown from private houses; and lighthouses and lightships were temporarily extinguished. The development of air warfare shortly caused the streets of London and all towns accessible from the east to be darkened, and searchlights, special guns, and an increasing number of air machines to be held in readiness against attack; while all trains in the south-eastern quarter of England had to have their blinds drawn after nightfall. The fall of Antwerp and the loss of the Belgian coast to the enemy brought the imminence of the danger home. These events in Belgium brought also a great accession to the number of Belgian refugees who had already sought shelter in England, and a vast organization of public and private benevolence catered for their needs. On the other hand, public opinion in England was cheered about this time by the arrival of the first contingent of Canadian troops, the forerunner of a mighty force from all the Dominions; and by the appearance in the battle line in France of native troops from India. This was unfortunately succeeded by the news of the defeat of Adml. Cradock at Coronel.

War Conditions.

The new parliamentary session, which opened on Nov. 11, followed immediately upon a serious development of the conflict—the entry of Turkey into the war as an ally of the Central Powers (which had as one result the proclamation of Egypt as a British Protectorate). The King, in his Speech, said that "the only measures which will be submitted to you, at this stage of the session, are such as seem necessary to my advisers for the attainment of the great purpose upon which the efforts of the Empire are set." The most burning question of the moment was the scale of pensions and disablement allowances for sailors and soldiers and their dependents. Mr. Asquith welcomed a suggestion made by Mr. Law that it should be referred for decision to a small committee of all parties. Mr. Arthur Henderson, who had succeeded the pacifist Mr. Ramsay Macdonald as chairman of the Labour party, promised the full support of organized labour in maintaining unity.

Pensions.

The finance of the war claimed the immediate attention of Parliament. The Prime Minister moved a Vote of Credit for £225,000,000, and a further addition of a million men to the army. On Nov. 17 the Chancellor of the Exchequer explained how it was proposed to raise the money. He had to provide for a deficit of nearly 340 millions. Following the precedents of Pitt in the French War and Gladstone in the Crimean War, a substantial part of this must be obtained by increased taxation levied on all classes. He proposed to double the income-tax (bringing it up to 2s. 6d.), and super-tax, to add the equivalent of a halfpenny a half-pint to the taxation of beer, and to raise the duty on tea from 5d. to 8d. In a full year, he calculated that these increases would bring in over 65 millions. He further announced the immediate issue of a loan of £350,000,000, at 3½%, at 95, which was promptly subscribed. He calculated the cost of the first full year of war as at least £450,000,000. Other important war measures taken at this time were the purchase by Government of £18,000,000 worth of sugar—a foretaste of the coming control of food supplies, not yet expected; a scheme for the manufacture of aniline dyes, hitherto made exclusively in Germany—the consumers to subscribe three millions, and the Government to guarantee debenture interest on another million and a half; the setting up by statute of a custodian of enemy property in the person of the Public Trustee.

First War Budget.

At the end of November the King crossed to France, and spent a week with his army in the field. The visit, which was repeated in subsequent years of war, greatly cheered and sustained the troops. Almost immediately afterwards came the news of Adml. Sturdee's victory off the Falkland Isles. But this was succeeded by evidence that, even though invasion of England in force might be too hazardous to be attempted, the country was exposed to harassing and destructive attacks by sea and air. On the morning of Dec. 16 German warships appeared off Hartlepool, a great business port, and Scarborough and Whitby, two much-frequented watering-places, and bombarded all three towns, doing considerable damage, and killing some 140 people, and wounding many others, mostly civilians, including women and children. The ships only remained for half an hour and then disappeared in the mist, before any portion of the British fleet, save patrol boats, could come up. On Christmas Eve a German aeroplane dropped a bomb in a bed of cabbages near Dover Castle, and at midday on Christmas Day another got up the Thames as far as Erith, but was then chased off. These events produced no panic, but stimulated recruiting, which remained brisk in England, though in Ireland Mr. Redmond's efforts were only moderately successful.

German Attacks by Sea and Air.

Speaking in December, Mr. Bonar Law, while rightfully claiming that the Opposition had distinguished itself from previous war-time oppositions by its patriotic reticence, remarked that perhaps, indeed, they had not criticized the Government enough. The early months of 1915 witnessed a change. It was clear that the war, which in the west had settled down into trench-fighting, would last for a considerable time, even assuming that the "steam-roller" of the Russian advance would eventually cause the German strangle-hold on north-eastern France to relax; it was not so clear that all that the Government had done and left undone was judicious. Criticism therefore awoke, and became steadily more insistent till the formation of the first Coalition Ministry. But it was criticism, not on party lines, directed to the more efficient conduct of the war; the criticism from the pacifist side was negligible. It was urged that voluntary enlistment, though hitherto fairly adequate, could not possibly give the army all the men it would want; that the half-hearted British policy of search and blockade, though it provoked reasoned objections from the American Government, failed to do any serious harm to Germany; that steps should at once be taken to regulate the price of food, which was steadily mounting; that the Press Bureau, under Sir Stanley (afterwards Lord) Buckmaster, was unduly harassing; that quite undue mildness was shown in the treatment accorded to enemy aliens, who should all be interned; that insufficient attention was paid to the development of the air force; and, above all, that the Government had entirely failed to meet the requirements for munitions of war.

Revival of Criticism.

Feeling in England was hardened by the German proclamation of Feb. 4, declaring a blockade of Great Britain from Feb. 18, claiming the right in the war-region to destroy British ships without providing means of escape for passengers and crew, and warning neutral ships that they might incur the same fate. "This," as Mr. Asquith said, "is in effect a claim to torpedo at sight, without regard to the safety of crew and passengers, any merchant vessel under any flag." It was resolved, in consequence, to detain, and take into port, ships carrying goods of presumed enemy destination, ownership or origin; and also to discriminate against submarine prisoners, as having disregarded the laws of war. The sinking of the "Lusitania," in accordance with this proclamation, by the Germans on May 7, with a great loss of life among innocent passengers, largely American, brought the aliens question in England to a head, as it produced violent anti-German riots and demonstrations all over the country. It was decided to intern or deport all enemy aliens, and to scrutinize carefully the cases of naturalized Germans. Widespread indignation had already been aroused this spring by the

Internment of Aliens.

only result of the movement was that Mr. Henderson, who had been active in its promotion, had to resign his seat in the War Cabinet. Even the Trades Union Congress at its annual meeting in September declared by an overwhelming majority against an International Conference at Stockholm "at the present moment." But before the end of the year the Labour party, suspicious of militarist or imperialistic designs among the Allies, drafted on its own account a statement of war aims of a somewhat idealistic character, demanding in particular the establishment of a league of nations,—a demand which Lord Robert Cecil welcomed on behalf of the Government.

During this autumn the Labour party also busied itself with a reorganization of its constitution, which was to transform it from a federation of Labour and Socialist societies into a national democratic political organization open to every worker who laboured "by hand or brain." The work was completed during the winter, and the new constitution was adopted in March 1918. The aim was, by forming local associations, and by appealing to middle-class workers and to the newly enfranchised women, to secure sufficient support from the electorate to warrant the hope of a Labour Government in power before many years. The new Labour party, thus constituted, held its first annual meeting in London in June 1918, promulgated a comprehensive socialistic programme, and in spite of the protests of Labour ministers, determined no longer to recognize the political truce, though it did not insist that these ministers should withdraw from office so long as the country was at war.

New Constitution for Labour Party.

The increasing detestation of the Germans which was inspired by their merciless submarine campaign and by their recurrent air-raids insured a warm welcome for certain measures which the King took in the summer of 1917 for dissociating the royal family from German connexions. In June he decreed that those princes of his family who were his subjects and bore German names and titles should relinquish those titles and adopt British surnames. Accordingly the family of Teck became that of Cambridge and that of Battenberg Mountbatten; and the following peerages were conferred: the Duke of Teck, Marquess of Cambridge; Prince Alexander of Teck, Earl of Athlone; Adml. Prince Louis of Battenberg, Marquess of Milford Haven; Prince Alexander of Battenberg, Marquess of Carisbrooke. In July the King abandoned all German titles for himself and family, and issued a proclamation that his house and family should henceforth be known as the house and family of Windsor The King also heartened the munition workers of Lancashire and Cheshire and the shipping and engineering workers of the Clyde district by making tours among them, and he paid a visit in the summer, not for the first time, to the Grand Fleet. He instituted, moreover, two new orders—the Order of the British Empire, and the Order of Companions of Honour.

The King and German Titles.

The reports of the Dardanelles and Mesopotamia Commissions were published, the one in the spring, and the other in the summer, of the year 1917; and the revelations they contained of mismanagement and muddle in high quarters confirmed the public in its satisfaction that the two War Administrations presided over by Mr. Asquith had given way to Mr. Lloyd George's War Cabinet. The report of the Mesopotamia Commission, with its reflections on the Government of India, brought about Mr. Austen Chamberlain's resignation of the Secretaryship of State for India. Other ministerial changes took place about the same time:—Lord Rhondda succeeded Lord Devonport as Food Controller, Sir Auckland Geddes succeeded Mr. Neville Chamberlain as Director of National Service; Mr. Barnes succeeded Mr. Henderson as Labour representative in the War Cabinet; Sir Edward Carson left the Admiralty to become a member of the War Cabinet without portfolio—a position from which he resigned in Jan. 1918; Sir Eric Geddes became First Lord of the Admiralty, Dr. Addison Minister of Reconstruction without portfolio, Mr. Hayes Fisher (afterwards Lord Downham) President of the Local Government Board, Mr. Hodge Minister of Pensions, and Mr. G. H. Roberts Minister of Labour. Mr. Lloyd George took the opportunity to bring back into high office his friend Mr. Churchill, and to attract to his banner Mr. Edwin Montagu, one of the ablest of the younger Liberals. Mr. Churchill became Minister of Munitions, and Mr. Montagu Secretary of State for India. Mr. Lloyd George also persuaded Gen. Smuts to remain in England as a regular member of the War Cabinet.

Ministerial Changes.

Several of these appointments had a special interest. The public looked askance at the return to office of Mr. Churchill, after his responsibility for the Dardanelles fiasco; but Mr. Lloyd George had a high opinion of his friend's energy and capacity in office, and realized the inadvisability of leaving him to become the nucleus of a critical and aggressive opposition. Mr. Montagu took office with a mission to satisfy, so far as might be possible, the aspirations of a large body of Indian opinion after a wide measure of self-government. He visited India in the winter of 1917–8, and drew up, in conjunction with Lord Chelmsford, the Viceroy, a report on Indian Constitutional Reform—published in the summer of 1918—which was well received in the House of Commons, but which was met with considerable criticism in the Lords, where the appointment of a joint committee to consider it was rejected by a majority of only four. Dr. Addison's appointment as Minister of Reconstruction showed a laudable desire on the part of the Government to be prepared for the end of hostilities, which might come with little warning. So zealously did he work that he was ready to announce, the day after the Armistice in Nov. 1918, the plans of the Government for demobilization, for the resettlement of officers and men in civil life, and for the reëstablishment of industry on a peace basis. His main expedient for tiding over a difficult time was the establishment of an out-of-work donation—to be in operation for six months for civil workers and for twelve months after demobilization for soldiers. The advent of the brothers Geddes to Cabinet rank was due to admirable administrative work done by Sir Auckland under the War Office, and by Sir Eric both under the War Office and in the Admiralty. Sir Auckland changed Mr. Neville Chamberlain's original scheme of national service, which had involved somewhat elaborate office expenses and had produced only moderate results. He saved some £100,000 a month by reducing the expenses of a central office, and worked instead through employment exchanges, trade unions and societies of employers' federations. He effected a drastic comb-out of civilians, card-indexed the whole of the army at home, transferred workers from luxury trades and occupations to essential industries, and recruited a further large supply of female labour.

Indian Self-Government.

Reconstruction.

National Service.

Sir Eric Geddes went to the Admiralty to complete and work a reorganization which his predecessor (Sir Edward Carson) had initiated, when, in May, a new naval war staff was constituted. The First Sea Lord, as chief of the staff, was freed of all administrative detail in order that he might give his undivided attention to questions of policy and strategy; and he had the assistance of a director of operations, a director of intelligence, and others. There was also revived the office of Admiralty Controller, who was to organize the whole of the supply of the navy including transport, victualling, manufacture of ordnance, and shipbuilding. Sir Eric had then been brought in from the outside to fill this important post, as a great civil administrator who had just successfully organized the military railway system behind the lines in France; and in July, when Sir Edward Carson's vigorous counsel was needed in the War Cabinet, he became himself First Lord. The two main tasks of the Admiralty under him were to defeat the submarine menace, and to stimulate shipbuilding. They were more successful in the first than in the second. By provision of various ingenious methods of attacking and destroying under-water vessels they steadily reduced the losses of British ships, and they were able to announce the details of some 150 German submarines destroyed. But in spite of obtaining the assistance of Lord Pirrie, the great Belfast shipbuilder, as Controller-General of Merchant Shipbuild-

Reorganization of Admiralty.

Shipbuilding.

country in his speech at the Guildhall on Lord Mayor's Day. Britain, he said, would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed.

War Conditions.

Meanwhile England was feeling day by day more and more what it meant to be at war. On the coasts, and especially the east coast, houses were destroyed which might either obstruct the British line of fire or serve as landmarks for a hostile fleet; lamps were extinguished on the sea front and all streets leading to it; no lights were allowed to be shown from private houses; and lighthouses and lightships were temporarily extinguished. The development of air warfare shortly caused the streets of London and all towns accessible from the east to be darkened, and searchlights, special guns, and an increasing number of air machines to be held in readiness against attack; while all trains in the south-eastern quarter of England had to have their blinds drawn after nightfall. The fall of Antwerp and the loss of the Belgian coast to the enemy brought the imminence of the danger home. These events in Belgium brought also a great accession to the number of Belgian refugees who had already sought shelter in England, and a vast organization of public and private benevolence catered for their needs. On the other hand, public opinion in England was cheered about this time by the arrival of the first contingent of Canadian troops, the forerunner of a mighty force from all the Dominions; and by the appearance in the battle line in France of native troops from India. This was unfortunately succeeded by the news of the defeat of Adml. Cradock at Coronel.

Pensions.

The new parliamentary session, which opened on Nov. 11, followed immediately upon a serious development of the conflict—the entry of Turkey into the war as an ally of the Central Powers (which had as one result the proclamation of Egypt as a British Protectorate). The King, in his Speech, said that "the only measures which will be submitted to you, at this stage of the session, are such as seem necessary to my advisers for the attainment of the great purpose upon which the efforts of the Empire are set." The most burning question of the moment was the scale of pensions and disablement allowances for sailors and soldiers and their dependents. Mr. Asquith welcomed a suggestion made by Mr. Law that it should be referred for decision to a small committee of all parties. Mr. Arthur Henderson, who had succeeded the pacifist Mr. Ramsay Macdonald as chairman of the Labour party, promised the full support of organized labour in maintaining unity.

First War Budget.

The finance of the war claimed the immediate attention of Parliament. The Prime Minister moved a Vote of Credit for £225,000,000, and a further addition of a million men to the army. On Nov. 17 the Chancellor of the Exchequer explained how it was proposed to raise the money. He had to provide for a deficit of nearly 340 millions. Following the precedents of Pitt in the French War and Gladstone in the Crimean War, a substantial part of this must be obtained by increased taxation levied on all classes. He proposed to double the income-tax (bringing it up to 2s. 6d.), and super-tax, to add the equivalent of a halfpenny a half-pint to the taxation of beer, and to raise the duty on tea from 5d. to 8d. In a full year, he calculated that these increases would bring in over 65 millions. He further announced the immediate issue of a loan of £350,000,000, at 3½%, at 95, which was promptly subscribed. He calculated the cost of the first full year of war as at least £450,000,000. Other important war measures taken at this time were the purchase by Government of £18,000,000 worth of sugar—a foretaste of the coming control of food supplies, not yet expected; a scheme for the manufacture of aniline dyes, hitherto made exclusively in Germany—the consumers to subscribe three millions, and the Government to guarantee debenture interest on another million and a half; the setting up by statute of a custodian of enemy property in the person of the Public Trustee.

German Attacks by Sea and Air.

At the end of November the King crossed to France, and spent a week with his army in the field. The visit, which was repeated in subsequent years of war, greatly cheered and sustained the troops. Almost immediately afterwards came the news of Adml. Sturdee's victory off the Falkland Isles. But this was succeeded by evidence that, even though invasion of England in force might be too hazardous to be attempted, the country was exposed to harassing and destructive attacks by sea and air. On the morning of Dec. 16 German warships appeared off Hartlepool, a great business port, and Scarborough and Whitby, two much-frequented watering-places, and bombarded all three towns, doing considerable damage, and killing some 140 people, and wounding many others, mostly civilians, including women and children. The ships only remained for half an hour and then disappeared in the mist, before any portion of the British fleet, save patrol boats, could come up. On Christmas Eve a German aeroplane dropped a bomb in a bed of cabbages near Dover Castle, and at midday on Christmas Day another got up the Thames as far as Erith, but was then chased off. These events produced no panic, but stimulated recruiting, which remained brisk in England, though in Ireland Mr. Redmond's efforts were only moderately successful.

Revival of Criticism.

Speaking in December, Mr. Bonar Law, while rightfully claiming that the Opposition had distinguished itself from previous war-time oppositions by its patriotic reticence, remarked that perhaps, indeed, they had not criticized the Government enough. The early months of 1915 witnessed a change. It was clear that the war, which in the west had settled down into trench-fighting, would last for a considerable time, even assuming that the "steam-roller" of the Russian advance would eventually cause the German strangle-hold on north-eastern France to relax; it was not so clear that all that the Government had done and left undone was judicious. Criticism therefore awoke, and became steadily more insistent till the formation of the first Coalition Ministry. But it was criticism, not on party lines, directed to the more efficient conduct of the war; the criticism from the pacifist side was negligible. It was urged that voluntary enlistment, though hitherto fairly adequate, could not possibly give the army all the men it would want; that the half-hearted British policy of search and blockade, though it provoked reasoned objections from the American Government, failed to do any serious harm to Germany; that steps should at once be taken to regulate the price of food, which was steadily mounting; that the Press Bureau, under Sir Stanley (afterwards Lord) Buckmaster, was unduly harassing; that quite undue mildness was shown in the treatment accorded to enemy aliens, who should all be interned; that insufficient attention was paid to the development of the air force; and, above all, that the Government had entirely failed to meet the requirements for munitions of war.

"Blockade" of Britain.

Feeling in England was hardened by the German proclamation of Feb. 4, declaring a blockade of Great Britain from Feb. 18, claiming the right in the war-region to destroy British ships without providing means of escape for passengers and crew, and warning neutral ships that they might incur the same fate. "This," as Mr. Asquith said, "is in effect a claim to torpedo at sight, without regard to the safety of crew and passengers, any merchant vessel under any flag." It was resolved, in consequence, to detain, and take into port, ships carrying goods of presumed enemy destination, ownership or origin; and also to discriminate against submarine prisoners, as having disregarded the laws of war. The sinking of the "Lusitania," in accordance with this proclamation, by the Germans on May 7, with a great loss of life among innocent passengers, largely American, brought the aliens question in England to a head, as it produced violent anti-German riots and demonstrations all over the country. It was decided to intern or deport all enemy aliens, and to scrutinize carefully the cases of naturalized Germans. Widespread indignation had already been aroused this spring by the

Internment of Aliens.

Ireland, but exempting north-east Ulster for five years, and providing for delegations representing both areas, with power to unify Irish legislation. If this plan was not satisfactory, he suggested that a convention of Irishmen of all parties should be assembled in Ireland in order to produce a scheme of their own to submit to the British Parliament. Neither the Nationalists nor the southern Unionists would accept Mr. Lloyd George's specific plan; but all parties except Sinn Fein accepted the idea of an Irish convention. Representative men, many of them non-political, were chosen to take part in the assembly; and, in order to produce an atmosphere of harmony, the Government released without reservations all the political prisoners in confinement for connexion with the Dublin rebellion. One of these was Mr. De Valera, who refused to have anything to do with the convention, and who was almost immediately elected M.P. for East Clare by an enormous majority. In spite of this ominous event, which showed that popular favour in southern Ireland was deserting the Nationalists for Sinn Fein, the Convention duly met on July 25, at Regent House, Trinity College, Dublin, and unanimously appointed Sir Horace Plunkett as their chairman. The Convention sat for many months, but, though there was an unexpected amount of agreement in some respects, it failed to arrive at anything approaching a unanimous report. The spread of the Sinn Fein movement in Ireland, the death from hunger strike of a Sinn Fein prisoner, and the illness and death of John Redmond, the Nationalist leader and a leading member of the conference, contributed to this untoward result. It was in April 1918 that the report was issued; and Sir Horace Plunkett claimed, in a letter to the Prime Minister, that "the Convention has laid the foundation of Irish agreement unprecedented in history." The Government, with no definite guidance from the Convention, proceeded to draft their own proposals; but these were not submitted to Parliament, as Lord French and Mr. Shortt, newly appointed Lord Lieutenant and Chief Secretary, discovered in May a further treasonable conspiracy between the Sinn Fein leaders and Germany, by which the Germans were to supply munitions for a rebellion to follow a successful German offensive in France. The Sinn Fein headquarters were raided by the police and 150 Sinn Fein leaders were arrested under the Defence of the Realm Act. In view of the disturbed state of Ireland, ministers, though they were harassed by the Nationalists in Parliament for their inaction, determined to postpone legislation.

Sinn Fein Conspiracy.

Lord Rhondda, at the outset of his Ministry, obtained a much larger control and wider scope than had been possessed by his predecessor as Food Controller. He took over the Oils and Fats Department from the Ministry of Munitions and was given by Order in Council the same powers as the Admiralty, Army Council, and Ministry of Munitions already possessed, for requisitioning and controlling prices. The new crop of potatoes enabled him to abolish potatoless days; but it was to prices, which had risen enormously owing not merely to speculation and profiteering, but to deficient harvests, shortage through submarine depredations, and the depreciaton of currency caused by the vast issues of paper money all over the world, that he mainly directed his attention. He explained his policy, in the House of Lords on July 26 1917, as being one of determining prices at every stage from the producer to the retailer, on the principle of allowing a reasonable pre-war profit. Existing agencies were to be used for the purposes of distribution under licence and control and under the supervision of local food controllers to be appointed by the local authority. He took over all the flour mills, and at heavy cost to the Exchequer reduced the price of flour so as to enable bread to be sold at 9d. per quartern loaf instead of the existing price of 1s. He fixed a sliding scale for prices of live cattle, but left the fixing of retail prices for joints to the local food committees. The appointment of local committees and fixing of prices went on regularly during the autumn of 1917 till hardly any kind of food was left at market price; and a vigorous economy campaign was organized under the direction of Sir Arthur Yapp, of the Y.M.C.A., as Director-General of Food Economy. Sugar cards were issued in October. The sale or use of cream, save for children and invalids, was prohibited during the winter months. A new scale of voluntary rations, not applying to children, was issued in November. The bread ration varied from 8 lb. per week for men on the heaviest manual labour to 3 lb. 8 oz. for women on sedentary work. For other foods the weekly ration was to be: cereals other than bread, 12 oz.; meat, 2 lb.; butter, margarine, oils and fats, 10 oz.; sugar, 8 oz. In December there were sporadic shortages of food of all kinds, and food queues at butchers', grocers' and bakers' shops became longer and more frequent, creating great dissatisfaction among all classes, especially the working-classes. To meet the difficulty in part Lord Rhondda gave powers to local committees to transfer stocks of margarine from retailers who were well supplied to those who were deficient; he also set up a Consumers' Council to advise the Ministry of Food; and he gave permission to the Birmingham Food Control Committee to try an experiment with a scheme whereby each household should be supplied with a card entitling them to prescribed rations of tea, butter and margarine to be procured from a particular registered retailer. As the year drew to a close, it was obvious, and Lord Rhondda admitted it himself, that compulsory rationing would have to come.

Lord Rhondda as Food Controller.

New Scale of Voluntary Rationing.

It should be noted that Government control was extended during 1917 over other staple industries besides those dealing with food. In July the cotton trade was brought under a board of control consisting of spinners, manufacturers, importers, distributors and workmen, together with representatives of the Board of Trade. In September a similar board was set up by the Army Council to regulate the woollen and worsted trade. Railways, the liquor trade, shipping, and mines had already passed successively under ministerial direction; as the strain of war grew more severe, the tendency inevitably was for each trade to set up a representative body to direct its functions and activities, through consultation with the Government. It may be added that, though it was no part of ministerial intention to discourage amusement and recreation, it was found necessary to suspend racing in May 1917.

General Control of Trade.

Mr. Lloyd George followed Mr. Asquith closely in his statements during the year of the war aims pursued by the Allies, and in his repudiation of an inconclusive peace. At Glasgow in July he said that "we should continue to fight for the great goal of international right and international justice, so that never again can brute force sit on the throne of justice, nor barbaric strength wield the sceptre of right." Mr. Asquith at Liverpool in October said that the worst that could happen to the world would be a patched-up peace; Gen. Smuts, who made several speeches while he remained in England as a member of the War Cabinet, said at Cardiff in the same month that the present struggle was deciding upon what basis the future would be built, whether on freedom, or on the will to power and the will to force. An entirely different note was struck by Lord Lansdowne, advocating in November, in a letter to the *Daily Telegraph* (which *The Times* had previously declined to publish), a negotiated peace. He received no support, save from professed pacifists; and Mr. Lloyd George took occasion to warn people against the man who thought there was a half-way house between defeat and victory. He admitted that it was a bad moment for the Allies in the war, because Russia had stopped and America was only preparing to come in. Certainly the course of the war in the autumn was unsatisfactory. Italy had been invaded in October and her armies driven back to the Piave, the fruits of Sir Julian Byng's brilliant victory, by the first use of tanks at Cambrai in November, had been largely neutralized by a German counterstroke, and in December a regular armistice was concluded between Germany and Russia, to be finally turned in the beginning of March 1918 into the humiliating treaty of Brest-Litovsk. Russia went out of the war; but Great Britain had a gleam of success in the end of the year through the capture of Jerusalem by Sir Edmund Allenby.

Leading Men and War Aims.

A Bad Moment in the War.

The prospect was sufficiently anxious fully to warrant the renewed call of the Prime Minister in the new year for sacrifice—sacrifice worthy of the sacrifices made by those at the front. "To every civilian," he wrote in a message to the nation, "I would say: 'Your firing-line is the works or the office in which you do your bit; the shop or the kitchen in which you spend or save; the bank or the post-office in which you buy your bonds.'" Sir Auckland Geddes immediately illustrated the necessity of sacrifice by introducing a bill, the chief effect of which was to call up from civil employment a number of young men who had hitherto been exempt from military service; and he announced that it was necessary to raise immediately 420,000 to 450,000 from this class. After some demur the trade unions agreed to coöperate in making the measure effective, and it became law on Feb. 6.

Prime Minister's New Year Message, 1918.

The finance of the war called this year for greater sacrifices from the taxpayer than ever before. The money voted for military purposes exceeded that of any previous year. Mr. Law obtained votes of credit for £600,000,000 in March; £500,000,000 in June; £700,000,000 (the largest amount ever voted in one sum) in August; and again for £700,000,000 in November. This made a total of £8,742,000,000 for the whole war (of which £1,465,000,000 had been lent to the Allies down to the Armistice). The average daily expenditure, which was £6,986,000 in 1917–8, fell in the seven war months of 1918–9 to £6,688,000. In his budget, introduced in April, Mr. Law made unprecedented demands on the taxpayer, in order to raise sufficient revenue to cover the peace expenditure and the increased debt charge. He imposed additional taxation estimated to bring in £114,000,000. Income tax was raised from 5s. to 6s. in the £; the farmers' tax was doubled; rates of supertax increased up to a maximum of 4s. 6d. in the £, and the limit of exemption lowered from £3,000 to £2,500; a 2d. stamp tax was placed on cheques; beer and spirit duties were doubled, and sugar, tobacco, and match duties raised; letter rate was raised to 1½d. and post card rate to 1d.; and there was to be a luxury tax of 2d. in the shilling. This last tax was eventually dropped, after a select committee of the House of Commons had spent many weeks in examining and reporting on its possibilities. There was little opposition to the rest of the proposals, save to the doubling of the stamp on cheques, against which there was considerable protest in the City, which the Chancellor of the Exchequer disregarded. Protests, however, were raised against extravagance and waste, without which the estimates of expenditure and revenue would hardly have reached the gigantic totals of £2,972,107,000 and £842,050,000, leaving a deficit of £2,130,147,000 to be met by loan. It was estimated in January by Mr. Herbert Samuel, chairman of a select committee of the House of Commons on national expenditure, that the following increases had taken place since the preceding August: the 9d. loaf, £45,000,000; bonus to potato-growers, £5,000,000; to miners, £20,000,000; to munition workers, £10,000,000; to railwaymen, £10,000,000; and to civil servants, £3,000,000; increases in pay to officers, over £7,000,000; to soldiers, £65,000,000. The increases of pay voted to navy and army by Parliament in 1917 were, it may be explained, overdue, and were only a fitting acknowledgment of their heroic service. It should be added that in the autumn of 1918 the Government made provision for the intellectual welfare of soldiers by establishing a new department, under the charge of Col. Lord Gorell, to direct and coördinate education in the army.

Mr. Law's Second Budget.

Huge Expenditure.

It was in the matter of food that the sacrifices demanded were most felt by the bulk of the population. In January the quantity of staple foods which might be consumed by visitors in hotels and by people taking casual meals was limited by order; and in February compulsory rationing of meat was enforced in London and the Home Counties. Meat cards were issued, with coupons attached, under conditions that restricted the weekly adult ration to 1s. 3d. worth of butcher's meat, together with other meat equivalent to 5 oz. of butcher's meat. At the same time butter and margarine were rationed, 4 oz. being allowed per head per week. At first there was a good deal of outcry against Lord Rhondda, as there had been against Lord Devonport, and attacks were made upon him in both Houses of Parliament, on account of his interferences with the course of trade, his "meddling and muddling." But in the Lords he was defended with spirit by Lord Milner, who said "that we were in a better position as regards food than any of the other countries engaged in the war; that, however the German submarine campaign might have embarrassed us, it had certainly not starved us and had not diminished the necessary supplies of our armies in the field." Mr. Clynes, the parliamentary Under-Secretary of the Department, claimed with justice that, under its arrangements, the poorest people were going to have an equal chance with their richer brethren, and that men, women and children, and not money, would be the consideration that would determine the appropriation of food. The Government, he said, had taken the place of the merchant and importer. The shortage of coal demanded further sacrifices by the general consumer. It was found necessary to supplement the "summer time" arrangement, now become permanent, by a curfew order, limiting the hours for lights and fires, and compelling theatres to close at 10:30; and gas and electric light were rationed. Later on in the year railway facilities were greatly diminished, and fares increased.

Compulsory Rationing of Meat.

The Government was criticised at the opening of the parliamentary session of 1918 for failing to reach the high standard they had set themselves in the departments of man-power, food production and shipbuilding. But Mr. Law pointed out that in 1917 they had put into the army 820,600 additional men; had brought a million more acres under the plough, producing an additional 850,000 tons of cereals and 3,000,000 tons of potatoes; and had built 1,163,474 tons of shipping, compared with a tonnage of 530,000 built in 1916. Another subject of criticism was the arrangement made with the Allies for the joint conduct of the war. Here the Government had been very active. The unity and continuity of direction which Mr. Lloyd George had ensured in the prosecution of the war, so far as the British forces were concerned, by the institution of his small War Cabinet in permanent session, he and his Cabinet earnestly desired to see more completely realized in the joint councils of the Allies. At a meeting of leading ministers of the principal Allies, held at Rapallo in the autumn of 1917, a plan of coördination was approved. A war council, composed of the Prime Minister and another member of each of the three Governments of France, Italy and Great Britain, was constituted to meet at Versailles normally not less than once a month, and it was hoped that other Great Powers, especially the United States, would join the council. Mr. Lloyd George was in Paris in November 1917 for the first meeting; but he was disappointed with the results, and, at a luncheon there, he made an appeal to public opinion in the various Allied countries, by delivering a very pessimistic and, as it seemed to many, a very injudicious speech, in which he declared that unless some change were effected he could no longer remain responsible for a war direction doomed to disaster from lack of unity. He succeeded in drawing public attention; but the critics were disposed to suggest that this was a new device to enable politicians to interfere with work properly belonging to soldiers. One of Mr. Lloyd George's difficulties in securing coördination had been the instability of French ministers during 1917. M. Briand's Ministry, after a tenure of office of 18 months, fell in March; M. Ribot, who succeeded him, was overturned in September; M. Painlevé, the next prime minister, only lasted two months; but, fortunately, in his successor, M. Clemenceau, France obtained a chief whose whole thoughts, like Mr. Lloyd George's, were devoted to winning the war. With his coöperation the Versailles Council was strengthened, and arrangements were made to coördinate it with the general staffs of the various Allies by each appointing a staff officer as permanent military adviser at Versailles. This arrangement cost the Government the services of Sir William Robertson, the chief of the staff, who refused either to take the military advisership,

Coördination of Allied Action.

The Versailles Council.

which fell to Sir Henry Wilson, or to continue in office unless the military adviser at Versailles were merely his deputy.

In fact, Mr. Lloyd George and his Cabinet had by no means reached their aim of satisfactory coördination when the great German advance began on March 21. The British and French armies were both driven back in a series of bloody battles, and they were seriously menaced with a rupture of their contact with each other by a fierce attack which the Germans directed against Amiens. Then it was realized that what the Allied forces in France needed for success was not an Allied council but a single military head. Sir Douglas Haig agreed in this with Lord Milner, who was then representing the War Cabinet in France, and with M. Clemenceau; and Gen. Foch, the most scientific of French soldiers, who had already distinguished himself highly in the war, was appointed Generalissimo, to the general satisfaction.

Appointment of a Generalissimo.

The next few months in Britain were perhaps the most anxious time of the whole war. A fresh Military Service bill was at once introduced, raising the military age to 50 and in certain cases to 55, and Ireland was for the first time to be included in a compulsory measure, ministers announcing at the same time that they were about to introduce a fresh Home Rule bill based on a consideration of the reports of the Irish Convention. The bill was hotly opposed, not only by the Nationalists, but by many experienced members who doubted whether it would really give ministers the men they needed. But Mr. Law insisted on carrying it as it stood, and told the Nationalists that they did not realize the growing bitterness in England at the exemption hitherto of Ireland from the sacrifices demanded of Great Britain. The bill was carried by majorities of 200; but it was never in fact put in force in Ireland. The Roman Church joined the Nationalists and Sinn Feiners in denouncing conscription, and the Government, having to abandon this project, abandoned also the attempt to pass this year a Home Rule bill.

New Military Service Bill.

Besides this new Military Service Act, the Government strengthened the forces in France by sending at once to Sir Douglas Haig a large proportion of the men hitherto retained in the island as a home defence army, and they instituted a vigorous comb-out once more of munition workers, miners, and the Civil Service. They strengthened the War Office, by making Lord Milner, the most vigorous member of the War Cabinet after the Prime Minister, Secretary of State for War; Lord Derby going as British ambassador to Paris, where he admirably reinforced the good understanding of the two Powers. The vacancy in the War Cabinet was filled by Mr. Austen Chamberlain. About the same time Sir William (since Lord) Weir succeeded Lord Rothermere as Air Minister.

Other Military Measures.

The strain engendered by the serious situation of the British forces in France produced some regrettable recriminations in Parliament *à propos* of the substitution of Gen. Sykes for Gen. Trenchard as chief of the air staff, and of a letter which a distinguished general, Sir Frederick Maurice, late director of military operations, thought fit to write to *The Times*, accusing ministers of making statements to Parliament, giving "a totally misleading impression" of the military situation. Ministers in this latter case offered to refer the charges to two judges, but the leading Liberals refused this tribunal, and Mr. Asquith, for the first time definitely acting as leader of opposition, moved to refer the allegations to a select committee of the House of Commons. Mr. Lloyd George, in debate, categorically and in detail maintained the truth of the Ministerial statements, and the motion was rejected by 293 votes to 106 votes. Gen. Maurice, for his breach of discipline, was placed by the Army Council on retired pay, and became a military correspondent for the press. The anxieties of the times also revived the strong feeling about the alien danger; and, in deference to public opinion, certificates of internment and naturalization were revised, no aliens were allowed to be employed in Government offices during the war, new measures were taken to establish the identity of aliens, and drastic restrictions were imposed on changes of name. Enemy banks, too, were finally wound up, and it was provided that no such banks should be established for a period after the war.

General Maurice's Charges.

The food condition was better this summer, owing to Lord Rhondda's admirable arrangements for securing supplies from all quarters of the world, and to the diminution of the menace from submarines owing to the provision of submarine chasers and other methods. Compulsory rations of meat, however, continued, though a larger quantity was allowed. Tea, too, was rationed, and though milk was not rationed its price was fixed according to the season. Arrangements were made to get in the harvest, in the absence of men at the front, by a great volunteer contingent of public-school boys in their holidays, and of women. The Food Controller established with great success national kitchens, and afterwards, in a few great towns, national restaurants. On July 3 Lord Rhondda died, just when he had arranged to introduce, in place of the loose cards hitherto used, a system of ration books. These were brought into use by his successor, Mr. Clynes, on July 14, and contained coupons for sugar, butter or margarine, lard, butcher's meat and bacon. Thus a satisfactory national system was at last evolved, which worked well and favoured no one.

Ration Books.

While it was generally admitted that the War Cabinet was a much better organ for the conduct of the war than any of the previous arrangements, there was frequent complaint that the result of concentrating all real directing power in the hands of four to six men, all deeply engrossed in the war, was that domestic affairs were insufficiently attended to. Accordingly in June 1918 a Committee on Home Affairs was appointed, which was to meet, at least once a week, under the chairmanship of the Home Secretary. All domestic questions requiring the coöperation of two or more Departments and calling for Cabinet decision were to be referred to it. The Committee were to have the power of decision, on behalf of the Cabinet, but larger questions of policy were to be referred to the War Cabinet.

Committee on Home Affairs.

The fourth anniversary of the war, being a Sunday, was observed as a day of national intercession, to invoke the Divine Blessing on the country's cause. Marshal Foch's offensive had been in progress for more than a fortnight; but it was still far from clear whether it could proceed without a check. Mr. Lloyd George sent a stirring message on the day to the Empire, bidding Britons to "hold fast." The battle, he told them, was not yet won. "We cannot seek to escape the horrors of war for ourselves by laying them up for our children. Having set our hands to the task we must see it through till a just and lasting settlement is achieved." The appeal was timely, but many of the workers paid little heed to it.

Throughout August and September, while the Allied troops in France, and especially the British armies, were winning victory after victory and steadily driving the Germans out, and while Bulgaria and Turkey were being forced to surrender, a series of strikes broke out all over the country, in many cases promoted not by the unions but by the shop stewards. Women workers in London on omnibuses and tubes struck to obtain the same war bonus as that accorded to the men. The strike spread to Bath, Bristol, Brighton, Folkestone, Hastings, and Weston-super-Mare, but the women returned to work in a couple of days on a promise of full consideration of their demand, which was eventually conceded. A much more serious matter was the London police strike which, without notice, deprived London for two days, Friday and Saturday, Aug. 30 and 31, of police protection. Undoubtedly the Metropolitan Police had grievances in regard to wages and allowances, which had been under consideration of the authorities for an unconscionable time without result, but it was a shock to public confidence that the defenders of law and order should have thought themselves at liberty to leave the public defenceless in order to call attention to their claims. Sir Edward Henry, the Commissioner of Police, resigned, and was succeeded by Gen. Macready; but it was believed that it was the Home Office that was mainly to blame. Mr. Lloyd George settled the strike by granting the men liberal terms; but he

Strikes in 1918.

declined to recognize any union of the police. There was a strike of Lancashire operative cotton-spinners in September against the advice of their union, but the men returned to work on an appeal by Mr. Lloyd George, who promised to appoint at once a tribunal of inquiry. The tribunal allowed an increase of wages, but rejected the men's claim to decide the nature of their unemployment benefit. The most serious strike was that of railway men, especially in the South Wales district, in the same month. There was a dispute as to the extent of the advance to be granted in wages, and the National Union of Railwaymen and the War Cabinet agreed upon a certain scale. But the men threw over their leaders, and were only brought to reason when the Courts prohibited the unions from paying strike pay to their members. Mr. J. H. Thomas resigned the secretaryship of the National Union, and was only induced to return after a while on a promise of better observance of discipline. These and other less important strikes caused the Trade Union Congress at Derby to impress upon trade unions the desirability of a frank acceptance of the Whitley Report and joint industrial councils.

Other Anxieties. Other causes of anxiety of the autumn were a severe attack of influenza, which spread rapidly from July onwards, caused the weekly death roll by the end of October to rise in London to 761, and in 96 great towns to 1,895, and only began to wane in November; a great deficiency in coal which led to household rationing, and to great economies in lighting and heating arrangements by municipalities and other public bodies; a reduction in the meat ration; and the sufferings of the British prisoners in Germany, and her delay in ratifying the Hague agreement for reciprocal return of prisoners which had been negotiated by Sir George Cave and Lord Newton.

The Beginning of the End. But from the end of September onwards the persistent and accumulating good news from every seat of war gradually changed the attitude of the country from one of anxiety to one of increasingly hopeful expectation. In opening a war bond campaign at the Guildhall on Sept. 30, Mr. Bonar Law concluded his speech with a new accent: "I do not say that this is the end, but I do say that this is the beginning of the end." For the purpose of the appeal Trafalgar Square was turned into a realistic representation of a shell-shattered French village. The "Feed the Guns" week, which was started by the opening of this show on Oct. 7, was all the more successful, as President Wilson was already in correspondence with the Central Powers as to the general principles on which peace could be based. By the time that Nov. 9, Lord Mayor's Day, came round, terms of armistice, amounting in effect to surrender, had been handed by Marshal Foch and Adml. Wemyss to a German delegation, and the news of their acceptance was hourly expected. The Lord Mayor's Show, with tanks and captured guns, and detachments of British, Imperial and Allied troops and of Women's Auxiliary Corps, typified the magnificent effort of the Empire now being crowned with victory; but on that Saturday evening the Prime Minister could only say at the Guildhall banquet, "I have no news for you."

The Armistice. It was on Monday morning, Nov. 11, at 11 o'clock, that the bursting of maroons announced to London that the Armistice had been signed, that hostilities had ceased, and that the war, in all human probability, was over. Almost instantly crowds poured into the streets, flags and decorative rugs and tapestries were hung out of windows throughout the centre of the town, from public offices and private houses, and a great throng assembled at Buckingham Palace to cheer the King, who appeared with the Queen on the balcony, and showed how fully he shared the rejoicings of his subjects. The scenes of enthusiasm and public jubilation in the streets throughout the day were indescribable. When the House of Commons met, the Prime Minister read out the terms of the Armistice, and added, "This is no time for words. Our hearts are too full of gratitude, to which no tongue can give adequate expression." Immediately the two Houses of Parliament, led by the Lord Chancellor and the Speaker, proceeded to St. Margaret's church to give thanks to God. Next day the King and Queen attended a special service of thanksgiving at St. Paul's. The general rejoicings lasted throughout the week. Before Parliament was prorogued both Houses voted addresses of congratulation to the King, which were presented to him in the Royal Gallery of the Palace of Westminster; and His Majesty, recalling the splendid services of the sailors and soldiers from all parts of his Dominions, pledged himself anew to uphold the honour of the Empire and to promote the well-being of the people. Before the month was out, in accordance with the terms of the Armistice, the German submarines came and surrendered off Harwich, and the main German fleet, battleships, battle cruisers, light cruisers and destroyers, steamed into the Firth of Forth and there surrendered to Adml. Beatty. It was a fitting tribute to the sea-power which had been the main factor in deciding the issue.

IV. After the War, 1918–21

General Election of Dec. 1918. The conclusion of hostilities was immediately followed hy the prorogation and dissolution of Parliament and a general election. Though protests were raised in some quarters, especially by the Independent Liberals, this was quite the natural procedure. Under the Parliament Act, the now expiring Parliament should have been dissolved three years previously, in Dec. 1915, and its life had only been prolonged from time to time by special Acts in order to avoid an election during the war. A Reform bill which enormously enlarged the electorate, adding two million male and six million female voters, had been passed in Feb., and it was right, and in accordance with precedent, that the new constituency should be consulted at the earliest moment compatible with national safety. It was evident that the Government to whom the new Parliament should give its confidence would go to the Peace Conference with its hands strengthened.

Coalition Continued. Was the Coalition to continue? The two heads of the Government, the Prime Minister, Mr. Lloyd George, and Mr. Bonar Law, the leader of the Unionists, decided, to the public satisfaction, that it should, on the ground that it would be disastrous to deal on party lines with the peace negotiations and the problems of reconstruction. They issued a joint appeal for support to the Coalition Government "in the execution of a policy devised in the interest of no particular class or section, but, so far as our light serves us, for the furtherance of the general good." They asked the nation to preserve the same unity in peace that it had manifested in war. They promised, among other things, to promote disarmament and a league of nations; to take special care of the soldiers and sailors who had served in the war; to increase production, especially in agriculture; to forward housing, afforestation, and transport; to give a preference to the colonies, and to preserve key industries at home; to reform the House of Lords; to develop responsible government in India; and to explore all paths towards a settlement in Ireland, with the provisos that there must be no separation and no coercion of Ulster. One element of the Coalition, the Labour party, had determined to secede; and accordingly Mr. Clynes, Mr. Hodge and Mr. Brace resigned, though Mr. Barnes preferred to leave his party and remain in the Government, and Mr. George Roberts accepted Mr. Clynes's post of Food Controller. The Labour party made great preparations to capture a large number of constituencies, but they committed the mistake of adopting among their candidates those Labour leaders who had opposed the national policy and had been notorious pacifists, as well as those who represented the patriotic majority. This attitude helped to increase the electoral support of the National Democratic party, who favoured the claims of Labour but approved of the Coalition. The Liberal party were divided. Those who had hitherto regularly supported Mr. Lloyd George were prepared to continue their support; but Mr. Asquith and those of his colleagues who had resigned with him, and a large section of the party, declined to commit themselves to any further support, and stood as Independent Liberals. In these circumstances, the Government asked for a pledge of support from candidates, and refused to assist those who declined to give it. The certificate that the pledge had been given was commonly called a "coupon," and was the subject of indignant protest by

Independent Liberals and some others. In response to a popular agitation for the trial of the Kaiser, for punishment of war criminals and for full reparation from Germany, Mr. Lloyd George on the eve of the election announced that these points were included in the Coalition programme, and further that he was against conscript armies in all lands.

Result of the Polls.

The election was held on Dec. 14 1918, but owing to the arrangements which had heen made for taking the votes of sailors and soldiers, the votes were not counted and announced till the end of the year. The result was an overwhelming victory for the Coalition, 478 of whose official candidates were returned, constituting a majority of 249 over all non-Coalition parties. The Labour party obtained 63 seats, a number which was sufficient to constitute them the official Opposition, as the Independent Liberal party came back only 28 strong, Mr. Asquith and all his former colleagues of Cabinet rank being defeated. The same fate befell the whole of the pacifists, whether among the Labour or among the Liberal party. The defeat of Labour and Independent Liberalism would not have been so overwhelming had there not been an extraordinary number of three-cornered contests. But the resolve of the electorate that the Government which waged the war to a successful issue should make the peace and begin the reconstruction of the country was clearly manifest. In Ireland the returns indicated the collapse of the Nationalists and the triumph of Sinn Fein in the south and west. Only seven Nationalists survived, compared with 73 Sinn Feiners and 25 Unionists. The only woman returned was Countess Markiewicz, a Sinn Feiner. None of the Sinn Feiners took their seats at Westminster.

Reconstruction of the Ministry.

Mr. Lloyd George immediately undertook a reconstruction of his Ministry. The changes were not so numerous as had been expected. Mr. Austen Chamberlain relieved Mr. Bonar Law of the extra burden of the Chancellorship of the Exchequer; Sir Frederick Smith, the Attorney-General, became Lord Chancellor, with the title of Lord Birkenhead; Lord Milner became Colonial Secretary; Mr. Walter Long was appointed First Lord of the Admiralty; Mr. Churchill was entrusted with two secretaryships of State, that of War and that of Air—a combination much and reasonably criticised; Sir Robert Horne became Minister of Labour, in succession to Mr. Hodge; Mr. Andrew Weir, created Lord Inverforth, was made Minister of Munitions (rechristened "Supply"); a new Ministry, that of Ways and Communications (afterwards hetter named "Transport"), was created for Sir Eric Geddes; and an Indian, Sir S. P. Sinha, who had been the first native to sit on the Viceroy's Council, was made Under-Secretary for India, and created a peer. In view of the approaching Peace Conference, the system by which the Prime Minister was relieved of the labours of leadership in the Commons, by entrusting them to Mr. Bonar Law, was continued.

Great Britain after the Armistice.

The last days of 1918 witnessed the reception in London of the first detachments of the returning British troops, of their victorious commander, Field-Marshai Haig, of Marshal Foch and M. Clemenceau; and, especially, of President Wilson, passing through England on his way to the Paris Conference. This great assembly was opened formally by President Poincaré on Jan. 18 1919, and thenceforward for several months Mr. Lloyd George and many of his principal colleagues were absent for long periods in Paris. These tokens of victory and peace were at variance with the symptoms of domestic life in Great Britain. Within a few days of the Armistice deputations from workers, especially munition workers, were demanding of the Prime Minister a living wage. The railway men decided to withdraw the truce in their industry and demanded an 8-hour day, which the Government promptly conceded. Other industrial troubles followed. Demobilized soldiers, miners, police, boilermakers, dock workers, engineers, all made urgent demands, with strikes declared or threatened. At first the trouble was worst on the Clyde, but the outlook was soon gloomier in London. The "tube" men came out on Feb. 3, and remained out for a week till they obtained an 8-hour day. Then the London electricians threatened to cut off all the electricity, stopping tramways and lighting, if the Government did not settle with the Clyde workers. The Government met the threat by a regulation under the Defence of the Realm Act making electrical strikers liable to six months' imprisonment.

Labour Unrest.

It was in these unpropitious circumstances that Parliament met. Mr. Adamson, a miners' representative, as chairman of the Labour party, appeared as Opposition leader; and Sir Donald Maclean, who had been deputy chairman of Ways and Means in the last Parliament, led the Independent Liberals, pending Mr. Asquith's return. Ministers did not satisfy the Labour men, who moved an amendment to the Address, but were beaten by 311 to 59. The note of labour unrest thus struck resounded throughout the session and the year. Increased wages and shorter hours were demanded in trade after trade, though in most cases there had been repeated advances of wages during the war. The increase of prices, indeed, seemed to warrant, or at least excuse, a further advance. On the other hand, there was an unfortunate but natural tendency, after the strenuous labours of the past four years, to take work easily, and not merely to work shorter hours but to produce less in the hour. Further, the revolution in Russia, the deplorable effects of which on the condition of the Russian working-classes were only gradually revealed to British working men, increased the revolutionary ardour of the more advanced leaders, and disposed them to foment disputes and reject conciliation. The miners were the first in the field, demanding not merely a 30% increase in wages, and a 6-hour day, hut nationalization of the mines and minerals.

Miners' Strike and Sankey Commission.

The Government wished, reasonably enough, before coming to a decision, to consider the effect on the general welfare of such stringent changes in the fundamental industry of the country. The Miners' Executive however would not wait, but took a ballot which declared hy a large majority in favour of a strike. A truce, however, was arranged, while the Government set up in haste a Royal Commission, presided over by Mr. Justice Sankey, the proceedings of which were hurried forward. Meanwhile ministers endeavoured to meet the industrial unrest by a new scheme of conciliation. Sir Robert Horne, Minister of Labour, convened on Feb. 27 a representative meeting of employers and workmen at Westminster, which Mr. Lloyd George subsequently addressed. This Joint Industrial Conference appointed a committee which recommended, *inter alia*, a maximum normal week of 48 hours, establishment by law of minimum time rates of universal application, and the creation of a permanent National Industrial Council of 400 members, elected in equal numbers by organized employers and work-people, to advise the Government on industrial questions. The report was accepted by the conference and received sympathetically by the Government. In pursuance of this policy the Government in November introduced and passed an Industrial Courts bill, giving the Minister of Labour power to appoint courts of inquiry into trade disputes, consisting of employers, workmen and independent persons. In March the two other members, besides the miners, of the "Triple Alliance" as it was called, the railway men and the transport workers, insistently demanded improved conditions, in particular a 48-hour week. Both gained the greater part of their claims, but the railway men only after a strike resolution. The Sankey Commission produced a litter of interim reports, the chairman's, which the Government adopted, recommending an increase in wages of 2s. a day, a 7-hour day till 1921, then a 6-hour day; a penny a ton, equivalent to £1,000,000 a year, to be set aside for the improvement of housing; reorganization of the industry, and an effective voice for the miners in its direction. On nationalization no opinion was expressed in the chairman's report. The miners were still dissatisfied, but, on their leaders' advice, gave a majority on a ballot for acceptance.

Nationalization.

Subsequently, in June, the Sankey Commission issued further reports, all recommending nationalization in some form, and most of them calling attention to the alarming decrease of output. The miners' leaders insisted that the Government, having accepted the interim report, were bound also to accept the nationalization

advocated in the final reports. But, in Oct., Mr. Lloyd George emphatically repudiated this, and said that the nation, and not a fraction, must decide a political and economic question of this magnitude. As time went on it became increasingly evident that the nation's experience of Government control during war did not incline it to extend the system during peace. People were thoroughly sick of " bureaucracy."

Restoration of Trade Practices.

The Government showed their good faith towards the Labour party by introducing and carrying through a bill restoring pre-war " trade practices," in spite of the growing evidence that many of these practices were hindrances to that increase of output which the situation needed. There was a comparative lull in trade disputes during the summer, though discontent was rife among the police both in London and in Liverpool, and there was a cotton strike which was settled by an advance of 30% in wages and the concession of a 48-hour week. There were also sporadic strikes of miners in South Wales and in Yorkshire. The threatened London police strike took place on Aug. 1, the object being to compel the Government to recognize the men's union. But it was a fiasco; those who came out were less than 900 out of a total of 20,000; and they were all dismissed. The labour situation became acute in September. The Trade Union Congress which met at Glasgow on Sept. 8 was mainly concerned with " Direct Action,"—that is, the application of the industrial strike to secure political change. In spite of a spirited protest by Mr. Clynes, who adjured the Labour men to adhere to constitutional methods, the Congress passed a resolution calling for the repeal of the Conscription Acts, and the immediate withdrawal of troops from Russia, and, failing compliance by the Government, for a special Congress " to decide what action shall be taken." This was almost immediately followed by a sudden and formidable railway strike. There had been negotiations for a standardization of wages for six months. Dissatisfied with Government concessions already amounting to £65,000,000 a year in the railway wage bill, and necessitating an advance of 50% in passenger rates and more in goods rates, a national strike was declared without warning on Sept. 26. Prompt and decisive measures to meet the threat to the nation were taken by Government. Volunteers were called for and responded in great numbers. Drastic restrictions were placed on light and fuel. Hyde Park was used as a milk depot for London. The motor lorries, which were the product of the war, proved an enormous resource. After the first few days, the railway companies began to run trains in increasing numbers. An attempt was made to involve other unions, but their officials, as a rule, promoted conciliation, and on Oct. 5 an agreement was reached, by which the Government promised stabilization of wages at their existing level till Sept. 30 1920, instead of Dec. 31 1919—a concession more of form than of substance. The strike ended on Oct. 6, having only lasted 10 days. Another dispute, not so spectacular, but gravely affecting the whole engineering trade, an iron moulders' strike, was in progress throughout all the last quarter of the year, and was finally settled at the end of the following Jan. by the concession of a 5s. increase in wages instead of the 15s. demanded.

Direct Action.

Railway Strike.

Fortunately this dismal record of industrial conflict does not exhaust the story of 1919. First of all, after many vicissitudes and uncertainties, peace was made and signed at Versailles on June 28. There were royal proclamations and public rejoicings. Parliament accepted the treaty at Mr. Lloyd George's hands with only a few expressions of dissatisfaction, and on July 19 there was a great victory march through London, ending up with a defile before the King, in front of Buckingham Palace, of the armed forces of the Empire and of those of the Allies. Sir David Beatty and Sir Douglas Haig led their men; Gen. Pershing commanded the Americans; and the Allied commander-in-chief, Marshal Foch, was himself present with his staff. The friends of the most novel portion of the Treaty of Versailles, the Covenant of the League of Nations, organized in the autumn a campaign in the country in its support,—beginning with a meeting on Oct. 13 at the Mansion House, presided over by the Lord Mayor, and addressed by Mr. Asquith, Lord Robert Cecil, and Mr. Clynes. One result of the peace was the termination in Oct. of the exceptional methods of government improvised by Mr. Lloyd George in order to win the war, and the reversion to a Cabinet in the pre-war sense. It consisted of 20 members, being for the most part the holders of those offices which usually conferred Cabinet rank in pre-war days; but Mr. Barnes was a member, though without a portfolio; the Viceroy and Chief Secretary for Ireland were to alternate, whichever happened to be in London at the moment being summoned; and the new Minister of Transport, Sir Eric Geddes, was also included. The Cabinet Secretary and his staff were retained.

The Peace.

Cabinet Government Restored.

New Ministries Created.

Besides the measures necessary for demobilization and for restoring the navy and army to a peace basis, ministers passed in this year several bills of great importance. Two new ministries were established, one of Health, into which the old Local Government Board was converted and to which were allotted various departments, relating to national health, from other offices; and one of Transport, which was to have control of railways, light railways, tramways, canals and inland navigation, roads, bridges, and traffic generally. Even electricity was included within its general scope; but a special Electricity Supply bill was passed, constituting commissioners who were to control the supply of electricity for domestic and industrial purposes. It was said in debate that the task of the Transport Ministry would be one for a " superman "; and eventually docks and harbours were exempted from his direct control. Then a Housing bill was passed, compelling local authorities to provide housing plans; and a scheme was adopted empowering such authorities to issue 5½% local bonds, free of income tax for holders of less than £500. A subsidy of not exceeding £15,000,000 was also provided by Government. There were bills also facilitating the acquisition of land for public purposes, and for the settlement of soldiers and sailors on the land. The emancipation of women, moreover, was practically completed by the passing of a bill providing that no person should be disqualified by sex from the exercise of any public function, or from being appointed to any civil or judicial office or post, or from entering or resuming any profession or vocation. Women were also made eligible as jurors, but the House of Lords still refused to admit women holders of peerages in their own right to sit or vote. At a by-election for Plymouth in Nov. Lady Astor was returned as member in place of her husband, who had succeeded to the peerage, and she was the first woman to sit and vote in the House of Commons. The last Government bill which deserves notice was a Profiteering bill, to endeavour to cope with the great inflation of prices. A central tribunal, presided over by Mr. McCurdy, was set up; and there were also local tribunals, with powers of fining and imprisoning those found guilty before them of undue profit-making.

Social Legislation.

The Budget of 1919.

The object and general tendency of this legislation were greatly to improve the health and social and industrial conditions of the masses of the people; to make, in Mr. Lloyd George's full-blooded phrase, " a land fit for heroes to live in," but at the price of setting up costly new ministries, and a considerable expenditure in rates and taxes. Mr. Chamberlain's budget was conceived on the same large lines. He estimated the expenditure at the gigantic sum of £1,434,910,000, and the revenue on the existing basis of taxation at £1,159,650,000. Therefore, though the war was over, he proposed to increase rather than diminish taxation, except that he reduced the excess profits duty—a war tax *par excellence*—from 80 to 40%. But he greatly increased the taxes on spirits and on beer, and raised the death duties on large estates. The main feature of the budget was the establishment at last of imperial preference, by giving an abatement of a sixth on the duties levied on such imports as tea, coffee, cocoa, sugar, tobacco and motor spirit, and of a third on those levied on cinema films, clocks and watches, motor-cars and cycles. He calculated that, by the changes proposed in taxation, he would bring the revenue up to £1,201,100,000. For the balance he looked to a Victory Loan, which was

sold after Whitsuntide in two forms: (1) 4% Victory Bonds issued at 85 redeemable by annual drawings at par; (2) a 4% funding loan issued at 80 and redeemable within 70 years in the ordinary way. The Labour party, with a portion of the Liberal party, strongly advocated a levy on capital in order to reduce the debt, now £8,000,000,000, to more manageable proportions; but Mr. Chamberlain set his face against it as the greatest possible discouragement of industry and enterprise.

Anti-waste Movement.

Mr. Asquith and the Independent Liberal party, with some assistance from the Labour men, started a not very formidable agitation in the name of Free Trade against the preferential proposals of the budget. A more effective movement, which gathered force as the year advanced, was that against the extravagant manner in which the Government was carried on. There was a special scandal about a motor-vehicle reception depot which had been established towards the close of the war on 600 ac. of good wheat land at Chippenham, near Slough, and which was apparently, now that the war was over, being rather extended than curtailed. A select committee of both Houses reported in July that the decision to continue the works after the Armistice had not been justified. Complaint was made of the continuance in peace of war-time naval and military estimates, of war-time ministries, such as Food, Supply and Shipping, and of enormously swollen staffs. It was maintained that it was impossible that the country could go on paying the gigantic taxes and rates which Parliament and the local authorities were exacting, without speedy bankruptcy. Lord Rothermere, who had himself been in charge of a new department during the war, was the protagonist of this movement; and his son, Mr. Esmond Harmsworth, was returned in Nov. to Parliament as primarily an "Anti-waste" member. An increasing section of the press harped on the same theme.

Sinn Fein in Ireland.

The principle of self-determination, as proclaimed by President Wilson in Paris, produced fermentation in many parts of the British Empire, notably India, South Africa, Egypt and Ireland. In India there was serious trouble in the Punjab, and a regrettable affair at Amritsar, but hope was placed in the Montagu-Chelmsford scheme of reform. In South Africa, fresh life was given to the Hertzog nationalist movement, and the South African party and the Unionists were driven to draw closer together. In Egypt there was violent upheaval, and Lord Milner went out with a special mission to inquire and report. In Ireland things proceeded from bad to worse throughout the year. Sinn Fein, who had triumphed in the elections, met at Dublin in Jan., appointed an executive, and pledged themselves to the independence of Ireland. An informal war against all representatives of British authority in the country was begun; and outrages and murders steadily increased, an attack on the life of the Viceroy, Lord French, coming near the end of the year. Meanwhile the Cabinet appointed a committee, of which Mr. (afterwards Lord) Long was chairman, to make representations as to Irish government.

Prince of Wales and the Empire.

It is pleasant to turn to record the visit in the autumn of the Prince of Wales, first to Newfoundland, then to Canada, and finally to the United States,—each visit, owing to his charm and power of sympathy, proving a bond of union, first of the Empire, and then of the English-speaking peoples. He made another imperial trip in 1920, this time to Australia and New Zealand, with equally happy results; but it was wisely decided that his contemplated visit to India should wait, in view of the strain of the last few years on his strength, till another winter. Another considerable accomplishment of the year 1919 was the passage of a Church Enabling bill, promoted both by the ecclesiastical authorities and by the main body of Church laymen, setting up a National Assembly of the Church of England, which should have some of the powers of independent action always asserted by the Church of Scotland, but subject to the supreme authority of Parliament. The National Assembly in its first meetings in the coming year seemed to justify the hopes formed of it. Though earnest, it was businesslike and not extreme.

Church Enabling Bill.

Mr. Asquith's Return to Parliament.

The year 1920 opened with the final severance of all direct connexion between the Government and organized labour by the resignation of Mr. Barnes, Minister without portfolio, and of Mr. George Roberts, the Food Controller. These resignations were, however, of small importance by the side of the reappearance of Mr. Asquith in Parliament as member for Paisley. Mr. Asquith's platform was that of a strong opponent to the Coalition, which he said ought now to be dissolved; he advocated Free Trade, retrenchment, and for Ireland Dominion Home Rule. At first it seemed as if he might provide the Government with what they sorely needed, a competent and determined Opposition. But his followers in the House were so few that, after a while, he was discouraged and transferred his main activities to the constituencies, where he succeeded in rallying most of the local Liberal associations to his banner.

The Budget of 1920.

The principal matters which occupied the attention of the country in the year were the labour unrest, Ireland, and Government extravagance. Mr. Chamberlain's budget dealt with figures of the same magnitude as in the previous year. In spite of the fact that the estimates for the navy and army showed a diminution of about £340,000,000 compared with those of the previous year, he nevertheless contemplated a total expenditure of £1,418,300,000; and in order that he might make a serious attempt at reducing the weight of the debt he increased the charges for letters, newspapers and telegrams, and also for receipt and stamp duties; he increased, moreover, still further the duty on beer; doubled that on wine with a special 50% duty on imported sparkling wines; and increased that on cigars. He lowered the limit of exemption from supertax to £2,000; but made various readjustments of income tax which would ease the burden to the taxpayer of small means, while taxing the rich man still more severely. Finally he imposed a new tax of 1s. in the £ on company profits, and raised the excess profits duty (which it had been hoped might be repealed) to 60%. To this last provision most serious exception was taken in the City of London and by the industries of the country; and an agitation was started which did not rest till it had finally secured a promise from the Chancellor to repeal the excess profits tax altogether in the coming year. The general result of the budget was to stimulate the "Anti-waste" party, who began to count seriously in by-elections.

Miners' Unrest.

The labour unrest during the year mainly affected the great coal-mining industry, which never settled down during the two and a half years that succeeded the war. It was but a patched-up truce that was arranged after the Sankey Commission, and the men still hankered after higher wages (to correspond with the still rising prices) and for nationalization in some form. The Government absolutely refused nationalization, but promoted a Coal Mines (Emergency) bill which should continue the war pooling arrangements and the Sankey wage till the termination of State control. This did not at all content the men, who demanded in March an immediate advance of 3s. per shift for miners over 16, and of 1s. 6d. below that age. After many negotiations the Government made a proposal of a guaranteed minimum advance of 2s. for adults, 1s. for youths between 16 and 18, and 9d. for boys under 16. This was accepted on ballot in April. It was estimated that this concession implied an extra charge of more than £30,000,000 a year on the industry, the surplus available to meet it being only about £8,000,000. The Government passed this session a Mining Industry bill, constituting a Department of Mines under the Board of Trade, dropping their original and wasteful idea of constituting a brand new ministry. This was unpopular among the miners, and perhaps contributed to the new demand sprung in Aug. on the Government. In 1919 ministers had had unfortunate dealings with the price of coal. In July of that year they had increased the price by 6s. a ton on the reasonable ground that this was the necessary result of the increased wages granted in accordance with the Sankey report. Then suddenly in Nov. they decreased the price of domestic coal by 10s., on the ground that it was fair that the consumer should share in the large profits which, owing

to the high prices ruling in America, were made on exported coal. But this could not be maintained, and in May 1920 the price of domestic coal was raised by 14s. 2d. a ton, and that of industrial coal by 4s. 2d. In view of these facts the miners at the end of July 1920 coupled with a demand for a further advance of 2s., 1s. and 9d. a shift for the three grades, a demand for a reduction of price to the consumer of 14s. 2d. a ton. It was thought that this bribe would make the public sympathetic to their claims. The calculation was that the increase of wages would cost the industry £27,000,000, and the reduction of price would add another £36,000,000,—thus more than accounting for the £60,000,000 made by the Government as profits on exported coal, and badly needed by them for their general revenue. These demands the Government absolutely declined to entertain; and on a ballot near the end of August the miners determined to strike in order to obtain them. But the opening of the strike was postponed for more than a month and a half, pending a series of negotiations between the Government, the representatives of the owners and the Miners' Federation, and also the spokesmen of the railway men and of the transport workers, who intervened as members of the Triple Alliance to support the miners' claims. Nationalization, though Mr. Smillie, one of the leaders, said the miners would never rest till they got it, was not actually claimed on this occasion; the altruistic demand for a large reduction of the price of coal to the consumer was soon dropped, and the struggle became one merely for increased wages—a claim based by the miners on the still rising prices. The Government and the owners pointed out that, since the increases in wages under the Sankey award, output had decreased,—and maintained that increase in wages would only be justified by increase of output. The miners insisted on an advance of 2s. as a preliminary, and the strike began in the middle of October and lasted a fortnight. The National Union of Railway Men threatened to strike in support of the miners, but it is doubtful whether the railway men themselves would have come out in any number. The question was never put to the test, as a provisional arrangement was come to, and confirmed on ballot, by which the miners got their 2s. a day (and could get more by increased output) till Jan. 3, after which wages were to be governed by a sliding scale, ultimately to be superseded by an agreed scheme for their permanent regulation. Sir Robert Horne, who, with the Prime Minister, bore the brunt of these negotiations, greatly enhanced his reputation by his firmness, adroitness and geniality.

Coal Strike of 1920.

There were disputes in the cotton and engineering and other trades during the year, but nothing comparable to that in the coal industry. Organized labour, which had been very sensitive since the Russian Revolution of any attempts to interfere in arms with the Soviet Government, formed, in this summer of 1920, in view of the strained relations between Poland and Russia, a Council of Action to prevent any such interference, with the implied threat of a general strike at its back. This unconstitutional proceeding was justified in a half-hearted manner by the moderate leaders, Mr. J. H. Thomas and Mr. Clynes. But the French Government refused to allow delegates of the Council of Action to remain in France; and, as an independent Poland and peace with Russia were soon seen to be secured, Mr. Thomas discreetly buried the Council with an appropriate eulogium at the Trade Union Congress. The financial offers made by the Bolshevists to the *Daily Herald*, the labour organ, which were revealed in the autumn, added to the growing discredit of Bolshevist rule in Labour eyes.

A Council of Action.

The "war" of murder and outrage waged by civilian Republicans in Ireland against the civil and military forces of the Crown, and against prominent loyalists in all parts of the south and west, was intensified from the beginning of the year onwards. To meet the crisis the Royal Irish Constabulary were increased, an auxiliary force of cadets, mainly young English officers who had served in the war, was created, and the troops reinforced. In August Sir Hamar Greenwood, who had succeeded Mr. Macpherson in April as Chief Secretary, hurried through Parliament a Restoration of Order in Ireland bill which provided for the suspension of trial by jury in disturbed areas and the substitution of trial by court martial. The strain of outrage and assassination to which military and police were subjected proved too much for the nerves of some members of the forces of order, especially among the insufficiently disciplined auxiliaries; and in a considerable number of cases unauthorized reprisals were carried out, in which individuals, not always guilty, were shot, and dwelling-houses and shops and warehouses and creameries were sacked and burnt. The British public, as a whole, was so conscious of the widespread conspiracy and the appalling crimes that had to be faced and got under by inadequate but courageous forces, that it was disposed to condone occasional acts of reprisal, provided that due efforts were made by the authorities to restore and enforce discipline. That was eventually done and certain definite reprisals authorized in definite cases, but not until after a delay of several months, during which Mr. Asquith and Sir John Simon and the Independent Liberals in general, with the aid of some bishops and other ministers of religion, conducted a violent agitation against the misdeeds of a small portion of the forces of the Crown—in which the crimes and the "war" against which these forces were struggling seemed to be unduly disregarded. The police and troops were successful in so far that they prevented Sinn Fein officers and tribunals from functioning openly, as heretofore, in many parts of the south and west. But, in spite of occasional boasts by ministers, like Mr. Lloyd George's assertion at Guildhall on Lord Mayor's day "We have murder by the throat," crime was not stopped, and there was little improvement in the state of the southern and western provinces by the summer of 1921. Indeed the "war" was carried in the spring of 1921 into England; and in Liverpool and the neighbouring country, and in London and the Home Counties, outrages were committed.

Sinn Fein "War" in Ireland.

Reprisals.

It was not merely by force that the Government proposed to meet the crisis in Ireland. The conjunction of Unionists and Liberals in one coalition seemed to give an opportunity for an agreed settlement of the Home Rule dispute. As a result of the labours of the Cabinet Committee presided over by Mr. Long, the Government introduced in Feb. a Home Rule bill of a novel character. It provided for the establishment of two Irish Parliaments, one in Belfast, for the six north-eastern counties, and one in Dublin for the remaining counties, and of a Council of Ireland "with a view to bringing about harmonious action between the Parliaments and Governments of Southern Ireland and Northern Ireland." The Council was to consist, in the first instance, of a President appointed by the King, and of delegations of 20 members of each of the two Irish Parliaments; but the two Parliaments might vary its constitution, and provide for it being elected by Parliamentary electors. Further, the two Irish Parliaments had power given them to establish, in place of the Council of Ireland, a Parliament for the whole of Ireland, consisting of one or two Houses. Thus the bill, which recognized the necessity of partition for the present, made provision for unity in the future. As originally drafted, the bill provided only for one House, a House of Commons, in each area; but the Lords added a Senate in each case, which the Government accepted. The executive power in the two areas was to continue vested in the King, who might delegate his authority to the lord lieutenant. The number of Irish members of Parliament at Westminster was to be 42. Of the Irish contribution of £18,000,000 a year to Imperial expenditure, 56% was apportioned to Southern, and 44% to Northern Ireland. There was to be a separate judiciary in each area, with a High Court of Appeal for the whole of Ireland. The powers reserved for the Imperial Parliament were roughly those reserved under the Act of 1914 which Mr. Redmond had accepted, save that further taxes were placed at the disposal of the two Parliaments; and in case of an Irish Parliament being constituted full powers over customs and excise were to be extended to it. If the southern Parliament refused to function, that part of Ireland was to be governed as a Crown colony. The reception of the bill was very unfavourable in southern and western Ireland, by Nation-

New Home Rule Bill.

alists and Sinn Feiners. It was a scheme, said the *Freeman's Journal*, for the "plunder and partition" of Ireland. Protestant Ulster, after a little hesitation, took the line that she was quite satisfied with her present position in the United Kingdom, but that, if Parliament thought such a measure right, she would accept it and do her best to make it a success. The bill was opposed, on the ground that it involved partition, both by the Labour party, who were prepared to concede the absolute right of self-determination, and by Mr. Asquith, who proclaimed his adherence to a Dominion Constitution. That also was the view of Sir Horace Plunkett; and several southern Unionists, such as Lord Dunraven and Lord Midleton, demanded complete fiscal autonomy for Ireland. The bill eventually passed into law in Dec. 1920, and was put into force in 1921. Lord Edmund Talbot, who became Viscount Fitzalan, an English Roman Catholic, was appointed Lord Lieutenant, and elections were duly held for the two Parliaments in the spring. As the campaign of Sinn Fein terrorism was still in full swing in southern Ireland, Sinn Feiners were everywhere returned in that area unopposed, save in Trinity College. In northern Ireland the Unionists had a great electoral success, returning 40 out of the 52 members of the new House of Commons. As Sir Edward Carson had retired and taken a Lordship of Appeal, Sir James Craig was the Unionist leader, and formed a Government as Prime Minister. The King and Queen opened the Ulster Parliament in state on June 22, the King, in moving language, expressing the hope in his Speech from the Throne that Irishmen would forgive and forget. Thereupon Mr. Lloyd George, while making every arrangement for strengthening the authority of the Crown in southern Ireland against the forces of disorder, issued a public invitation to Mr. De Valera, the Sinn Fein leader, and to Sir James Craig, to come and confer with him at once in London without conditions. Sir J. Craig accepted immediately; and Mr. De Valera, after consulting with other Sinn Fein leaders and with some of the southern Unionists, also came to London; while a truce was called in the "war" (*see* further the article IRELAND).

Bill Passed and Elections Held.

The King and Ulster.

Several important changes took place in the Ministry in the early months of 1921. Mr. Long retired from the Admiralty for ill health and was subsequently created a viscount. Lord Milner, after remarkable service to the State, resigned the Colonial Office, and retired into private life, being succeeded by Mr. Churchill. Mr. Bonar Law had a sudden breakdown, which entailed immediate abandonment of political work, and which, as he was one of the main pillars of the Coalition, might well result in serious political complications. But Mr. Austen Chamberlain was immediately elected by the Unionist party to be leader in the House of Commons in his place; and he stepped into the same confidential relation that Mr. Law had held in regard to the Prime Minister. He became Lord Privy Seal. Sir Robert Horne succeeded him as Chancellor of the Exchequer, and was succeeded at the Board of Trade by Mr. Stanley Baldwin. The Government bills which attracted most attention in this session were one by Sir Eric Geddes for grouping the railways of the country in the interests of efficiency and economy; and another promoted by the Board of Trade for the safeguarding of special industries. The Independent Liberals, in their opposition to the Protection which they discovered in this latter bill, made use of the well-known arts of obstruction, and all night sittings were resumed. The budget dropped the excess profits duty, and the higher rates of duty imposed in the previous year on sparkling wine and cigars. Postal rates were however further increased. Otherwise taxation remained at the same height.

Ministerial Changes in 1921.

This heavy burden was more felt this year, because the period of inflated trade which had succeeded the war had come to a sudden end in the previous autumn; prices tumbled down; it was impossible to find markets for goods; wages had to be reduced and men dismissed in one great industry after another; and unemployment steadily increased. It was borne forcibly in upon every individual that economy in public and private expenditure was imperative. By-elections, as might be expected with so huge a majority, had on the whole gone against the Government from the beginning. But their losses this spring and early summer had this exceptional character, that the victors in the three contests which attracted most attention, at Dover, St. George's (Westminster) and East Herts., ran simply and purely as "Anti-waste" candidates. The tendency of the Government, already manifested, to restrict its ambitions and curtail its schemes, was intensified. Already practically all the new war ministries, except the Pensions Ministry, had been disbanded; the putting into complete effect of Mr. H. A. L. Fisher's comprehensive but somewhat extravagant Education Act had been postponed; and urgent admonitions in favour of economy had been circulated to the departments. Now it was announced by Mr. Churchill that he had formulated a scheme by which the enormous outlay in Mesopotamia and Palestine, against which there had been a great public outcry, might be materially reduced. Dr. Addison, who was thought to have studied thoroughness rather than economy in regard to his housing schemes and his medical staff at the Ministry of Health, resigned that Ministry; and so strong a protest was roused by his retention in the Cabinet without a portfolio but with a salary, that the Prime Minister felt it necessary in June to declare that the arrangement was only for the remainder of the session, and that the salary would be halved. Dr. Addison's successor in the Ministry of Health, Sir Alfred Mond, announced an administration on much less ambitious lines. Ministers also abandoned their guarantee of agricultural prices and wages; and further determined to terminate their control of the coal industry on April 1, four months earlier than the date originally announced. This resulted in yet another coal strike, or stoppage, the most serious of all the strikes in the industry in these years. The men could not reconcile themselves to the great reductions in wages necessary to make the industry self-supporting. And they also demanded a national pool—a half-hearted form of their old demand for nationalization. They alienated public sympathy at first by withdrawing the pump men from the mines—a position from which they had to recede. The Government offered a temporary subsidy of £10,000,000 to tide over the difficult early weeks; but terms could not be arranged, and the strike lasted for three months—April, May and June,—and was settled in the end on terms which the men might have had early in the dispute, if they had not clung to the national pool, which of course had to be abandoned. The loss to the country was enormous, as the great industries dependent upon coal had one after another to close down their works. But the employers in these industries could support the stoppage better than the men, as, owing to the depression of trade, they would have been manufacturing during these months at a loss. The funds of the great unions were depleted, and many of them got deeply into debt; and there was some want and hardship amongst women and children. Happily, it was a season of warmth and brilliant sunshine, so that the domestic fire was needed only for cooking.

Depression in Trade.

Government Expenditure Curtailed.

Coal Stoppage of 1921.

A momentous conference was held in London in the summer of 1921 between the Prime Ministers of the United Kingdom, the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand and the Union of South Africa, together with representatives of India. The main object of the conference was to formulate a common foreign policy for the sister nations composing the British Empire, and to come to a decision as to the renewal of the Anglo-Japanese alliance (*see* BRITISH EMPIRE).

Empire Premiers in Conference.

There were symptoms of uneasiness in the latter part of 1920 and in 1921 in the extreme wings of both parties to the Coalition. On the one hand there was some fraternizing between Independent and Coalition Liberals; and on the other Lord Salisbury was the spokesman of those Tories who urged Unionists to come out of the Coalition and resume their independence, a course which had already been taken by a few individuals, conspicuous among whom were his brothers, Lord Robert and Lord Hugh Cecil. But neither move-

Position of Parties in 1921.

ment appeared to be strongly supported, though much greater independence had been shown of late by the Ministerial majority in the House of Commons. The Labour party, though alternately upbraided and cajoled by the Independent Liberals, showed no disposition to enter into a political compact with them; and without such an arrangement it did not look as if Mr. Asquith and his friends could command anything approaching adequate support in the country to regain office. Many Liberals indeed had gone over to Labour; but the Labour party, whose programme demanded a continuance of heavy expenditure and therefore high taxation, were for the time out of accord with public sentiment.

Mr. Lloyd George, in spite of virulent abuse, partly political, partly personal, still remained throughout 1921 by far the greatest individual force in the country. He strengthened his position, indeed, from every point of view but one, by the course of events during the closing months of the year. The fact that, after general expectations of a break-down in the Irish negotiations, the conference which began in London in October between delegated representatives of Sinn Fein and the Government ended on Dec. 6 in a unanimously signed agreement for the setting-up of an Irish Free State, was a great personal triumph for his patient diplomacy. Though he was too much engaged in this matter to be able, as he had intended to do, to attend the Conference for the Limitation of Armament held in Washington, at which Mr. Balfour took his place, the Prime Minister could claim for his Government a very satisfactory issue from the Conference, to the initiation of which by President Harding and his Secretary of State, Mr. Hughes, Mr. Lloyd George himself had given the strongest encouragement earlier in the year. Incidentally, the question of a prolongation of the Anglo-Japanese alliance—which had been a difficult point at the Imperial Conference in the summer—was successfully removed by the substitution of the Four-Power Agreement adopted in Washington; and thus Mr. Lloyd George had the satisfaction of clearing away two important obstacles to the consolidation of the Anglo-American *entente* for which he was always striving in international affairs.

The only point of view from which Mr. Lloyd George's indispensability at this moment as Prime Minister could be said, therefore, to have been weakened was that of his success. Paradoxically enough, the mere fact that his long struggle to reconcile Irish national aspirations with inclusion within the British Empire had at last been rewarded might appear to leave him no longer *l'homme nécessaire* for that purpose. How far this possibility might react on the political situation, in the later regrouping of parties, had now to be shown. But individually Mr. Lloyd George, at the end of 1921, held the dominating place among political leaders. Mr. Asquith had lost his hold both over the country and over his old party. The Labour party, though practically certain of a large increase in Parliamentary representation whenever the country should be appealed to, had several prominent leaders but no really outstanding chief. The Conservatives, as such, were without any striking personality; Mr. Austen Chamberlain had shown no disposition to break away from the alliance with Mr. Lloyd George, and Mr. Bonar Law, though his health was restored, had ignored every suggestion so far that he should return to the political arena as an independent Conservative leader. Among the rest, the only men whose reputations had notably grown in 1921 were Lord Birkenhead and Mr. Churchill; and it was to them, either in rivalry or in combination, that current political talk usually pointed, should occasion arise for alternatives to a Lloyd George Ministry. As Lord Chancellor, Lord Birkenhead had won golden opinions on all sides, and he had never shown his capacity for statesmanship more prominently than during the past year, when he had put all his pre-war record as an aggressive sympathizer with Ulster aside in helping to secure an agreement with Sinn Fein. He and Mr. Churchill were still sufficiently young, as well as able and experienced, to make their political futures incalculable. (G. E. B.)
